is even doubtful whether some of her sayings were strictly original; for it seems that it must have been known before her time that "some cocks think that the sun gets up to hear them crow." The Prince Consort was, for some time after the publication of *Adam Bede*, in the habit of complaining to his farm bailiff that he "had to go to bed with twenty quarts of milk on his mind." The Sunday walk of Mr. and Mrs. Poyser with their children to church may be placed on a level with some of the most delightful passages in *Tristram Shandy*. The story of Hester with its melancholy complications is a blot on an admirable book. In speaking of anything composed by George Eliot it is a censure to say that it might have been written by another. The *Mill on the Floss* is a still more remarkable excavation of social remains. Mrs. Tulliver and her sisters convey the impression that their strange conventional opinions about bonnets and house linen and the distribution of money by will are sacred and inevitable convictions, though they are now heard of for the first time. In this, as in some other stories, George Eliot shows a blamable toleration of an underbred and worthless hero or lover. Maggie's favourite suitor is as worthless and vulgar as the foreign adventurer who in *Middlemarch* becomes the second husband of the stately Dorothea.

By the time of writing *Felix Holt* George Eliot had unfortunately begun to persuade herself that it was her duty to teach doctrines, instead of creating human beings. Assertions of equality and hints of communism destroy much of the pleasure which might be derived from the story. The determination of a cultivated artisan not to be a gentleman may be disinterested, but it is capricious and provoking. Perhaps the best of all the novels is *Silas Marner*, especially as the shortness of the story leaves no room for George Eliot's frequent shortcomings in the construction of a plot. The small squire and his reprobate brother, with all the surrounding society of equals and superiors, are at the same time real and interesting; and the gentler and melancholy weaver who gives his name to the tale is profoundly touching. The scene in which the lost child brings its golden hair into the spot of light which marked the place of Silas's lost treasure is one of the most perfect passages in fiction. As George Eliot accomplished so much, it is perhaps unreasonable to regret that only a portion of her life was allowed for the indulgence of her genius. Her youth was wasted on Strauss, and her later days were given to *Daniel Deronda* and *Theophrastus Such*; but her divagations from the proper purpose of her life will be forgotten while *Adam Bede* and *Silas Marner* are still ornaments of English literature.

A NEW IRISH PANACEA.

CONSIDERING all things, it may be said that for the last week affairs in Ireland have gone on swimmingly. Very few people have been murdered or wounded. A canon, a policeman or two, and so on, make up the insignificant list. Only three ladies have been shot at or threatened. Mr. Bence Jones continues to exist. "Boycotting," indeed, goes on merrily; but we have got accustomed to that, and have nearly educated ourselves up to Mr. Gladstone's sublime height of irritation at the troublesome people who object to the word and the thing. It is true that the Empress of Austria has changed her mind as to visiting Ireland; but that is positively reassuring, for it would have been very awkward if Her Majesty had been shot in mistake for somebody else, and a little inconvenient to the sensitiveness of old-fashioned people if her horse's bridle had been seized when she was out hunting, and she had been ordered by the *de facto* Government to go home. Above all, the ordinary law has actually succeeded in getting its great assize to come off at Dublin. The Castle is not in flames, nor has there been an Armageddon in the Phoenix. It is true that the wise shake their heads and assert that "a conviction is impossible," but that is prejudice. For months Mr. Gladstone and his colleagues have been, to use a vulgar phrase, bottling themselves up for this great effort. What did it matter if a few peers and policemen were murdered? Mr. Parnell was going to be tried. What did it matter if Captain Boycott was ruined? Mr. Dillon was going to experience the full terrors of the ordinary law—when they could be got ready. What did it matter if troublesome persons wrote to the Prime Minister for an expression of opinion, if nothing more? He referred them to the solemn ceremony soon to come off in the Four Courts. It has, we believe, been more or less confidentially stated by admirers of the Government that this same attitude was "majestic," though we are not certain that "sagacious" is not the proper adjective employed. At any rate, the moment has come, and during the progress of the trial it is nothing to do but to wait until the jury disagree. It is as fair and reasonable to employ the interval for what outsiders have to offer. The majestic proposition that the Government will have to think of something else cannot be too

before us a document which is a little mysterious in its way. It purports to be for private circulation only, but, as it does not announce itself to come from anybody in particular, nor is there a single name or address mentioned in it, the crime of divulging its contents does not weigh very heavily on our conscience. It is a prospectus of "The Irish Land and Farming Company, Limited," and its capital is stated at ten millions; but the usual spaces for

directors, bankers, secretary, office address, &c., are, like the Bellman's chart, "a perfect and absolute blank." Even the printer has modestly withheld his name from the readers of this surprising document. Nevertheless, it bears the outward semblance of a genuine prospectus, and propounds its proposals in good set terms. "It is generally admitted," we are told, "that the land of Ireland is peculiarly adapted for rearing and feeding cattle, for breeding horses, and for dairy produce," and that good management and capital are all that is wanted to make Irish farms the most profitable in Europe. The statement is perhaps a little rounded off, but it may pass. The next is that bad harvests, &c., have brought matters to such a crisis that landed estates may be bought in Ireland ("especially in Mayo and Westmeath," says the prospectus writer, with an engaging innocence, as if Mayo and Westmeath were famous for nothing but bad harvests) at a price considerably below their value. The nonpayment of rents, he adds, with historic calmness, will cause many landowners to be willing to sell at a considerable sacrifice; the difficulty of these unfortunate persons the Company proposes to make its opportunity. They are to sell, and the Company is to buy, on the terms of one-third money down, and the rest on mortgage at four and a half per cent, so as to leave plenty of capital for working. Then the domains acquired are to be thrown into grazing farms or sheep runs of from 5,000 to 15,000 acres, and arable farms of from 1,500 to 2,000. The present small tenants, thinks our projector, here animated, it is to be feared, by the sanguine delusions of his class, will require small compensation for going out. Welsh labourers—"it is known that Welsh labour is cheap, and the men are industrious and sober"—colonial or Scotch managers, North-country machinists are to be imported. Then the projector has a return of cautiousness. The farmsteads are to be built in a hollow square; all the windows and doors, save one entrance gate, are to be inwards, and the surrounding wall is to be loopholed "in order to afford protection against attack in unquiet times." The homesteads are apparently not to be insured; indeed it is doubtful whether the Insurance Companies would like the investment. But night patrols of the sober and industrious Welshmen will serve against incendiarism. The remainder of the prospectus is confined to business details about slaughtering, embarkation, and so forth. Some of these show less appreciation of the actualities of the time than the remarks about loopholes and patrolling. But it cannot be expected that a preliminary prospectus should look to every detail; and the Steamboat Companies at Cork had not perhaps signalized themselves as they have done in Mr. Bence Jones's case when the idea of the Company first dawned in our projector's head. We should suggest, as an addition to the scheme, that the Company should acquire a harbour sufficiently near to its domains, fortify it, and run steamers with its own stock and produce at its own expense. It would be well, too, that these steamers should be well armed and stoutly built, inasmuch as the *de facto* Government of Ireland will doubtless soon issue letters of marque to render the operation of Boycotting more thorough and complete. Still, a good deal of thoughtfulness is shown for so short a document. The cattle are to be slaughtered on the spot, which clearly deprives the enemy of his chance of waylaying them on the route. The patrols, too, will doubtless give an eye to such as are left out at night in the fields, to prevent the operations of the Land League Sub-Committee for the Propagation of Cruelty to Animals. Perhaps the only serious miscalculation of the economic kind is the mention of cheapness as likely to result from the importation of Welsh labourers. Occupations which involve considerable chance of a short life are usually highly paid; and it is to be feared that the Welsh labourers, what with working, patrolling, and being shot at—in short, what with doubling the parts of shepherd and soldier—will want to double the pay too. This, however, is only a detail. The scheme would undoubtedly add to the wealth of the United Kingdom, it is financially feasible, and the overladen breast of the politician cannot help emitting a huge sigh at the thought of the relief it would be from his special point of view. Fancy wafts us to such an Ireland as this Ireland would be after a few years of scrimmaging and lively practice from the loopholes (which should certainly be armed with a cruel four-pounder or two). That Ireland would be peaceful, profitable, contented, with flocks and herds dotting the emerald plains unhounded, in possession of their tails, and with no sticks studded with nails in their insides. In that Ireland Mr. Biggar would perforce cease to trouble and Mr. Parnell's occupation would be gone. In short, it would be an Ireland which would have all the advantages of that frequently suggested one under the sea, with a good many more beside; a help to England instead of a thorn in her side; a credit to civilization instead of a disgrace to it; a beauty spot instead of a sore on the face of the earth. "Sweet, sweet vision! Foolish, foolish dream!" in the words of an author, who, by the way, knew a good deal about Ireland, though these words of his were used in another context.

Like all such visions our vision quickly fades. It cannot be said that the projector has forgotten any economical law or that he has proposed anything which would not be for the interest—well understood—of every one concerned, Englishmen and Irishmen, landlords and tenants. His plan is merely a recognition of what Ireland is fit for, and a practical attempt to adjust the state of Ireland to that fitness. It is a fantastic and grandiose acknowledgment of the laws of nature. That Ireland is best suited for stock-rearing of all sorts, and that stock-rearing of all sorts is best conducted on a large scale, are both certain facts. That small

holdings must mean poverty and wretchedness, unless thrift is the one thought of the holder, and that thrift and Irishmen are two contradictory terms, are facts as certain. But our projector counts without the English Radical party and the Radical majority—actual, if not numerical—in the English Cabinet. He forgets—poor man!—that what is sauce for the English and Scotch goose is not sauce for the Irish gander. Here is Mr. Chamberlain talking pathetically about countervailing duties. He sympathizes with the Bristol sugar-maker; he drops a tear over the Coventry maker of ribbons and watches; he alludes gracefully to the great Protectionist struggle of thirty years ago; he makes a modest reference to his own sufferings at the hands, or points, of intrusive Belgian screws. But, with a nobility quite charming to witness, he points out that it cannot be helped. The weakest must go to the wall, the people who are driven out of one trade must take up another. Exactly so; but how is it, we may ask, that this universal law is to stop short at St. George's Channel? Why is the Irishman to be protected against the result of Free-trade, against the laws of supply and demand, against anything and everything? The amiable creature's luke-warmest friends are just now declaring that nothing will do but the three F's. Well and good. But when an inconvenient person like Sir Robert Anstruther turns up and shows that fixity of tenure means that the best man is not to have the tools he can best use; that fair rents mean arbitrary interference with supply and demand; that free sale means the diversion of the capital necessary for cultivation—what is to be said then? All these things we can imagine our melancholy projector urging on the President of the Board of Trade. There can be no doubt that Mr. Chamberlain would dismiss him with a superior smile. They have altered all that, he and his friends. As Lord Carnarvon has just pointed out, they have pity for murderers and none for victims; precious balms, with not the least tendency to break the weakest head, for the Land Leaguer; and precious balms that come down like millstones on the pate of the landowner. As it is with their ethics, so with their economics. Mr. Bright and Mr. Chamberlain no doubt conduct their own private business on exactly the same principles as those on which this projector wants to conduct the business of his Company. They certainly profess a wish that the business of landowning should be conducted on the same principles, that all feudal nonsense as to the relations of landlord and tenant should be done away with. But when the thing is carried out—why, then, there is a strange alteration of tone. It becomes the first duty of Government to protect one class, and to give it privileges of a far more arbitrary kind than any feudal system ever devised. So that we fear our projector will hardly get a hearing for his scheme just at present, and that his shares are some way from being quoted on the Stock Exchange. And yet when we think of his ideal Ireland—an Ireland bludgeonless, revolverless, void of perjured jurymen and threatening-letter-writing shebeen-haunters—it is hard not to drop a tear.

MONACO AND ANDORRA.

TWO of the smallest States in Europe are in a state of revolutionary excitement. Monaco is convulsed by the fear of losing, and Andorra by the hope of gaining, a public gambling-house. The case of Monaco is sufficiently well understood. Honoré, fifth prince of this dominion, made himself unpopular with his subjects, and his cruel laws reduced them to the verge of starvation. The son suffered for the father's fault, and, by a majestic exercise of the popular will, Rocca-bruna and Mentone shook off the yoke of the Grimaldis in 1848. Since that date Mentone has grown wonderfully, and now consists of several dozen hotels, a few villas, and the old town, with its narrow dirty streets climbing up towards the Bergeon. But Rocca-bruna is still a hamlet, peopled, apparently, chiefly by small boys and girls, who ask tourists for sous, and by a leprous woman who haunts the height between Monaco and Mentone. Thus it is difficult for the historical imagination, even when aided by all the works recommended by Mr. Frederic Harrison, to reconstruct the scene of revolutionary frenzy. There must have been something idyllic in it, like a *crisis* in some petty Sicilian city of old times, for the fishers and shepherds of the Riviera are still very picturesque. Mild as the movement may have been, it shook the throne of Prince Florestan. Mentone and Rocca-bruna remained independent till the French annexed Nice. At that date the Prince of Monaco received some compensation for disturbance, and was allowed to give M. Blanc a concession for a gambling-house. One important result was the recent alliance between a princess of the house of Blanc and a prince of the house of Bonaparte. But there have been other results scarcely less important.

No one who knew Monaco and the neighbouring little peninsula of Monte Carlo ten years ago can recognize them now with pleasure. Ten years ago Monte Carlo, where the gambling establishment is, was shunned by the wealthy and respectable. The Hôtel de Paris offered accommodation of a kind sumptuous in both senses of the word to the gamster. The hotel sheltered many a wandering guest, who left his little all in the treasury of M. Blanc, or, perhaps, had the wisdom to carry away a few thousand francs of winnings. All but punters avoided the siren shore and listened to the Virgilian warning, *fuge littus avarum*. Now things are altered. The establishment has become so

wealthy that it is comparatively respectable. The gardens and flowery terraces, and lists for them that shoot doves, have greatly increased in number and beauty. Villas spring up on every side. Even five years ago there were deep shady olive groves, and plots covered with grey anemones, within a hundred yards of the Casino. Nowhere did the wild flowers blossom so abundantly as on the lower slopes of the hill beneath Turbia, where the sun brings out the strong scent of pine and thyme, and the bees go murmuring about their toils in February mornings. But the wealth and enterprise of Mme. Blanc is changing all that. The pretty old lanes run now between stuccoed walls. The olive plots where the anemones blossomed are covered with villas. Only to the westwards there is still an open space, where a brook falls down from a height, as in the Theocritean epigram, through the laurels and pines, and beneath the fragrant flowers of the early blossoming May. Even that brook will soon be a sewer, and the whole tiny principality will become what is beautifully called a "residential district." The sea and the grey bluff of the Tête du Chien will remain alone unaltered.

It is unnecessary to say that the popular trouble in Monaco is not caused by fury at the Vandalism of the "Administration." The tourists, the gamsters, the Monaguesque public prefer the trim parterres by the Casino to the old free expanse of olive-yards and flowers. But the people are afraid of losing that by which their country is nourished—the Casino, with its "distractions." The respectable visitors to Cannes and Mentone and Nice, and the respectable inhabitants of these watering-places, and of all the towns as far as Genoa and Marseilles, look with ill-will on Monte Carlo. They are preparing, or perhaps have prepared, a petition to the French Chambers asking that the concession for the Casino may be taken away, or, at all events, not renewed. There are good reasons for the protest. The Casino demoralizes all the clerks and young fellows of spirit on the Riviera. They cease to be content with *baccarat* at their *cercles*. They put money, sometimes their employers' money, in their pockets, and they hasten to challenge the bank at Monte Carlo. Of course they lose, and very often they blow their brains out. Moreover, the attractions of the bank bring a crowd of cosmopolitan roughs to the beautiful shore where a few invalids and many robust visitors flirt, play tennis, and make excursions. This is what the English visitors who do not play dislike so much. A worse-looking, a dirtier set of copper captains, and women more tawdry, than they who steal their neighbours' stakes at Monte Carlo are nowhere to be studied by the philosopher. Where do the dirty men get the money they punt with? These grimy visitors disgust the evangelical clergymen and squires' ladies, who are very glad to listen to the music and read the newspapers provided by the Administration. If Monte Carlo were not a licensed hell, the ruffianly men and unspeakable women would not gather in that paradise. Once more, the tables corrupt the invalids and the invalids' able-bodied friends. These people first view the sport with aversion, then with curiosity, then they risk five francs, and after that they become confirmed punters. When they win, they boast that they have been "robbing the widow." They dream of martingales and devise systems. They bet on the number of their rooms in their hotels. The banker at Mentone is amused when they come every day to cash circular notes. They are bad gamblers, these amateurs, ill-tempered and reckless in adversity, cowardly when the luck is favourable.

It is miserable to see the flushed, hectic faces of the invalids, to observe pretty English girls sobbing with excitement at roulette, and fairly breaking down and crying at the railway station as they wait for the train which is to carry them back penniless to Nice or Mentone. The fact is that roulette, though a most fascinating amusement, is too good for a race with only partially developed self-control. The Wise Man of the Stoics, and people who approach him in calmness, could play roulette and enjoy themselves tranquilly enough. If a man knows how much he can afford to lose, and is sure he can stop there, why should he not pay what he can afford for his entertainment? The chances and combinations are so numerous, the prizes so rich and so certain to be paid when won, that roulette affords delights not dissimilar to those derived from a blending of commercial speculation with the higher mathematics. The best thing to do, we think, is to back the number which turned up last, one of the twelves and one of the columns. Numbers very often recur twice running, and when they do, thirty-five times his stake rewards the judicious investment. Even if the number fail you, and the twelve also, if you are right on the column, you are no loser, and are ready to start again. Zero, of course, is annoying, but all sport has its drawbacks. However, as men and women are not philosophers, and cannot enjoy themselves temperately, we fear it must be admitted that Monte Carlo is rather a curse to France and to the neighbourhood. It demoralizes almost every one, and it brings bad company into a nook admirably fitted by nature to be a successful watering-place.

To withdraw the concession, however, is no easy matter. There is the Prince of Monaco and there are France and Italy to be reckoned with. If France interferes, the Prince will throw himself into the arms of Italy. If Italy shows moral designs, the Prince will court the alliance of France. On this bit of coast the two Powers are very jealous of each other, and last winter French engineers were strongly fortifying the heights which command the harbour and the Corniche road. Relying perhaps on these political facts, and on the natural gamblesomeness of the French, Mme. Blanc is building a new wing, and is adding to her tables, and to the number of them that serve tables, the polite and intelligent croupiers. We fear that,

in spite of all protests, Monte Carlo has still a long lease of life. It is certain, we think, that Monaco and the neighbourhood would be prosperous without the tables. Many of the citizens probably recognize this truth. But when the little Republic of Andorra, in the Pyrenees, is convulsed with the hope of gaining a concession for a Casino, it is not likely that Monaco hears with pleasure the remonstrances of respectable visitors.

The case of Andorra, as described by a writer in the *Daily News*, is not unlike that of Monaco. Andorra has a shadowy independence as old as Charlemagne. She is secluded, not to say isolated; she is homely, and she should be happy. But a Company intends to make a railway to the place, and to allure passengers by setting up gambling-rooms. The foolish people, foreseeing an influx of wealth, approve of this proposal. They forget that, while princes, as Mr. Bright knows, are a bad lot, republics are Virtue's chosen home. The people of Andorra are as eager for a hell as the Prince of Monaco. This must be very painful to Mr. Bright; for, if there is an old Republic in the world, and one remote from the horrid influences of Courts, it is Andorra. The *viguers*, a kind of official representatives of Spain (monarchic Spain) and of France, are vainly trying to moderate the democratic avarice of Andorra. The Republic, like the Principality on the Riviera, lies between two great and jealous Powers. We must hope that France and Spain will compel Andorra to be virtuous.

DEAN STANLEY ON SUBSCRIPTION.

DEAN STANLEY has contributed to the January number of *Macmillan's Magazine* a curiously characteristic paper on "Subscription" to doctrinal formularies, which he tells us at the outset "is always misleading and always futile," though at the end he declines to decide absolutely whether that remnant of subscription which is still left in the Church of England is worth keeping or not. The real object of his paper is apparently twofold, firstly to prove that in the famous contest about Tract XC. some forty years ago, the "Liberal section of the Church," which is explained to mean the party now called "Broad Church," were on the side of toleration, not of exclusion, and that Cardinal Newman is quite mistaken in saying that the Liberals drove him from Oxford; secondly to insist that the proper and normal state of the Church is to have no creeds or articles of faith, and that this was her actual condition for the first fifteen centuries. It is difficult to say which paradox is the most unhistorical, though the writer's ingenious method of stating, or mistating, his case gives a certain *prima facie* semblance of plausibility to his tale. It may not perhaps be deemed wholly irrelevant to inquire in passing how far this retrospective zeal of modern Liberals for building the sepulchres of the Tractarian prophets, who were persecuted in 1845, is illustrated by their attitude towards the sons of the prophets who are imprisoned for convictions, mistaken it may be but certainly no less conscientious, in 1880. It is a cheap generosity which restricts itself to martyrs who have become historical. The Dean begins his story by reproducing in his own fashion—which, to say the least, is neither appreciative nor exhaustive—the argument of Tract XC., and then adds, what is true enough, that its appearance provoked a sharp and bitter controversy, and that many of Mr. Newman's old followers fell away from their allegiance to him in consequence. Then comes a guarded, and very inadequate admission that "some of those who had on other grounds advocated the relaxation of the enormous burden of subscription," were equally unwilling to allow any such toleration of the popularly received sense of subscription as the Tract claimed, not as matter of favour but of justice. And thus we are brought to the somewhat enigmatic statement that "the respect due to the personal character and lofty genius of Cardinal Newman withheld the early opponents of Tract XC. from pursuing their victory beyond the point of a censure pronounced by the Hebdomadal Board at Oxford." The meaning is obscure, but in the first place we suspect that Dean Stanley is looking at the Oxford of 1841 through the spectacles of the Oxford Liberals who welcomed Cardinal Newman back to his University in 1880. Of respect for "the personal character and lofty genius" of the author of Tract XC., whatever may have been "due," very little was felt at Oxford in 1841, except among his immediate friends and disciples. In the next place why should his opponents at the time have "pursued their victory" further? They had got all they wanted; they had driven him from Oxford, made him "give up his place in the movement," as he himself expresses it, and procured the condemnation and discontinuance of the Tracts. Dr. Newman's own account, in the *Apologia*, of what occurred at that period, and who were the leading agents in it, is both more precise and more accurate than Dean Stanley's. "It is surely," he says, "a matter of historical fact that I left Oxford upon the University proceedings of 1841; and in those proceedings, whether we look to the Heads of Houses or the resident Masters, the leaders, if intellect and influence make men such, were members of the Liberal party. Those who did not lead, concurred or acquiesced in them—I may say, felt a satisfaction. I do not recollect any Liberal who was on my side on that occasion. Excepting the Liberal, no other party, as a party, acted against me." Dr. Newman might have added in illustration of this statement what Dean Stanley is careful to omit, that the two most conspicuous names among "the four Tutors," whose public protest against Tract XC. led to all the subsequent pro-

ceedings, were those of Mr. Tait of Balliol, now Archbishop of Canterbury, and Mr. Wilson of St. John's, afterwards better known as one of the seven Essayists and Reviewers, both of whom notoriously belonged to the Liberal or Broad Church party.

So much for what occurred in 1841. But when the contest was renewed in 1845, after the publication of Ward's *Ideal*, the Liberals, according to the Dean, came generously to the rescue, as the champions of toleration for an unpopular school. Dr. Newman has again explained what actually occurred. To himself personally it mattered nothing, for he had retired four years before from the contest, and was on the eve of secession. But if some who were prominent among his assailants in 1841 acted then more consistently with their professed principles of toleration, it was probably, as he says, from a growing sense of the danger of driving a number of his followers to Rome that they helped to shelter from the zeal of the Hebdomadal Board, not them only, but all parties in the Church, Tractarians, Evangelicals, and Liberals, on the obvious ground too rigid a construction of the Anglican formularies would on some point or other prove a difficulty to all alike. So much as this indeed may be gathered, without much reading between the lines, from the Dean's own account of the matter in the following ingenious paragraph, which contains the sole allusion—a very faint and inadequate one—to the prominent part taken by Mr. Tait in the proceedings of 1841.

One who has since been raised to the highest post of the English Church, and who has united in that position the liberality and firmness of mind which he showed on this occasion, generously put aside his former objections to the celebrated tract, and issued a powerful and convincing protest against extending the censure to Tract XC any further than the immediate purpose of pronouncing the position untenable, and against drawing from the natural antipathy to its circumlocutions a legal and ecclesiastical instrument for abridging the liberties of the whole Church.

That is to say, having secured in 1841 "the immediate purpose" of getting Tractarian principles with which they had no sympathy condemned and their leading apologist silenced, Broad Churchmen took fright in 1845 at the threatened imposition of a rigid test, which might have proved equally fatal to their own principles, and not unnaturally exerted all their energies to avert it. The proposed censure of Tract XC. by the Oxford Convocation at the same time was not averted by any co-operation of theirs but, as even Dean Stanley is constrained to admit, by "the courageous and magnanimous conduct of the two proctors," who put their constitutional veto upon it. He does not add that both proctors were high churchmen, the survivor of them, the Dean of St. Paul's, being also an intimate friend of Mr. Newman's. It may thus be quite true that the great Tractarian leader was driven to Rome, not by any external force, but by his own religious convictions, but it is none the less true that "the Liberals were the men who drove him"—not, as Dean Stanley misquotes his words, "from the Anglican Church," but "from Oxford," and that "it was they who had opened the attack on Tract XC., and who would gain a second benefit"—as in fact they did—"if he went on to retire from the Anglican Church." The Dean is more accurate in the closing chapter of what he calls his "history" of Tract XC. It was certainly republished by Dr. Pusey twenty years later, without any word of protest from Bishops, Heads of Houses, or popular journalists, and with the cordial welcome of the leading High Church periodical of the day, the *Christian Remembrancer*. But we fail to perceive that the history, either in its correct or its Stanleyan version, proves much, one way or the other, as to the expediency of subscription to the 39 Articles, while as to the general question of subscription to formularies of faith it certainly proves nothing at all.

But the real drift of the Dean's lucubrations on this latter point is manifest enough, though, as usual with him, he implies more than he actually says, and assumes principles which he shrinks from directly avowing, perhaps even to himself. In the learned and thoughtful preface to his Commentary on the 39 Articles the late Bishop Forbes of Brechin—who neither professes nor could be suspected of any overweening fondness for a formulary so Protestant in its tone—expresses his belief that subscription to some such quasi-dogmatic test is necessary under existing circumstances, and adds that he "should have more sympathy with those who are now clamouring for a change, if he did not think that in attacking the Articles, they were attacking the general dogmatic character of Christian confessions." That, if we do not entirely misread it, is precisely the aim of the Dean's paper. Thus e.g. he quotes, in order to reprobate it, the opinion "of one whom we all honour and respect for his character and abilities," without however naming him. The reference is to a paper read by the Bishop of Durham—certainly no extreme high churchman or dogmatist—at the Leicester Church Congress of last year. Bishop Lightfoot, while fully recognizing the existence of "three schools of thought" in the Church, had been insisting on "adherence to the fundamental principles of the Catholic creed and loyalty to the Church" as a necessary qualification for its ministers, and he then proceeds as follows. We give the passage as it stands in the authorized report, bracketing such portions of it as are omitted in Dean Stanley's extract:—

[Pleading as I do to-day for toleration, and even large toleration, I am bound to emphasize this demand as a *fundamental qualification*. At this time more especially the obligation is the stronger, because some seem to think that a Church can do very well without a creed, or at least without a creed to which its ministers are required to subscribe. Though I have the deepest sympathy with the motives and aspirations of some who hold this view, though I hold it a privilege to reckon them among my personal friends, I have not, and never had, any sympathy with the

view itself. I do not understand a Church without a creed.] I do not understand a clergyman standing up to teach in a church without first asking himself definitely what he is going to teach. I can see no other prospect before such a Church but vagueness, irresolution, inanity, [confusion,] decay. The motive power is gone. The bond of cohesion is snapped. [Dissolution—rapid dissolution—is the inevitable consequence. So far as I have read history, no body ever has held together for long under such conditions as this.]

We should almost have thought, but for Dean Stanley's denial that the statement was so manifestly true as scarcely to escape being a truism. He tells us however, not only that the Bishop's description exactly depicts the condition of the Church of England since 1865—when the terms of subscription were altered—but also "applies equally to the whole Latin Church down to the publication of the decrees of Pope Pius IV., and applies especially to the Church of the first three centuries." There is just that kind of half truth in this statement which is so essentially misleading. A certain change did take place at the Reformation, because, as Bishop Forbes explains it, when the separated portions of Christendom could no longer impose their distinctive teachings as the voice of the Holy Spirit, and therefore binding on the conscience, it became "necessary to call in the element of individual good faith to maintain the position." And hence not only did the various Protestant bodies put forth their Confessions, but even the Roman Church found it necessary to exact of her ministers a subscription to the Creed of Pius IV. But there was nothing in this procedure out of harmony with ancient precedent. Neither the early nor the mediæval Church had been able to "do without a Creed," which was held obligatory on all who ministered or worshipped at her altars. The seeming exception only proves the rule. For the first century or two, while the tradition of apostolic teaching still lived on in the Church, and before the assaults of heresy had been widely felt, no need had arisen for anything beyond some such elementary formula as was supplied in the short baptismal creed. But as the Church increased and controversies multiplied, it was found indispensable to frame and impose longer and more distinctive symbols, "as a guide of the believer and the teacher" alike, to quote Canon Swinson's words in Smith's *Dictionary of Christian Antiquities*, and the very names by which these creeds were known—*κατὰν, ἡ πίστις, σύμβολον, tessera, regula fidei*, indicate unmistakably that they were used as doctrinal tests. There may not have been a general subscription required of the clergy, but as each successive heresy was condemned by successive Councils, the Bishops were required to sign the new test framed for the purpose, and not only so, but it soon became an established custom for the bishops to repeat the creeds of former Councils at an early session of every subsequent one. Whoever was known to contravene these creeds incurred excommunication. In the middle ages tests on matters lying beyond the range of the creeds and dogmas of the Church were often imposed at particular times and places, and thus e.g. the graduates of some Spanish Universities were required to profess their adhesion to the doctrines of the Immaculate Conception. But there is no need to dwell on such details. It is enough for our purpose to point out that Bishop Lightfoot's hypothetical description of a Church without a creed, and a clergy not bound to teach anything in particular is as unlike as possible to a description of either the early or the mediæval Church. The Bishop may well indeed declare that so far as he knows history, no Church has ever held together for long under such conditions. Of course it is another question how far the particular form of subscription retained in the Church of England is a good one, but when Dean Stanley observes that "this depends simply on whether it keeps out a single member of the Church of England from entering the ministry," one can hardly help being reminded of one professing "member of the Church of England," who is excluded from the ministry by this very test, and who only the other day announced that he was "a Nonconformist against his will" and "retained his orders," though he at the same time pointedly disclaimed the name of "Christian." We mean of course Mr. Voysey, who, if there was no subscription, would be ministering in the Church of England at this moment. Dean Stanley would probably be prepared to accept this alternative, if we may judge from his estimate of the proper "largeness" of a national Church:—

No member of the Society of Friends would be permitted to preach the necessity of sacraments. No Unitarian minister would be permitted to read the Athanasian Creed. No Congregational minister would be permitted to affirm the necessity of an Established Church or of the Episcopal succession. It is only in the National Church that such variations and their opposites could be permitted. The largeness of the Church involves the largeness of sufferance.

For, if not only the necessity of sacraments and episcopal succession, but the doctrines of the Athanasian Creed or "their opposites" may be fairly taught, then that very "adherence to the fundamental principles of the Catholic creed," which Bishop Lightfoot thinks an indispensable qualification for the ministry must be abandoned.

We are not now discussing whether such a state of things is desirable or not, but it would clearly go far towards changing "an established Church into an established chaos," as somebody has happily expressed it. And we must at least protest in the name of history and common sense against the portentous paradox that such a Church would bear the faintest resemblance to, still less be "exactly like," the Latin Church of the middle ages, and "especially the Church of the first three centuries. As to the growing deficiency of able and enlightened University men for the

service of the Church, of which Dean Stanley complains, many explanations might be alleged, one of the most obvious being the multiplication of similar careers open to educated young men. But, so far as the difficulty is a religious one, we more than doubt the greater attraction of a creedless Church. At all events the Dean's reference to Oxford and Cambridge is singularly infelicitous for his argument. He tells us that at the latter University Bishop Lightfoot's "great and salutary influence" has procured an adequate supply of gifted and faithful pastors. But if these pastors have been attracted by Bishop Lightfoot's influence, they must, on his own showing, have taken their stand on the very principle which the Dean so emphatically condemns.

THE DUMAS STATUE.

THAT portion of the French public which is comparatively indifferent to fortnightly Ministerial crises, and to dark stories of dinner parties, at which the guests recall the Groves of Blarney by the singular promiscuity of their selection, has been much exercised of late by the proposal to erect a statue to Alexandre Dumas—the father, not the son. The names of the statue Committee include most of the principal Frenchmen of letters on the lighter side. The opposition is numerous, but motley; and its main body consists, if we mistake not, of M. Zola and the Zolaïtes. To do justice to the notorious master of advertising and "experimental" novels—by the way, the bones of the Clapham sect must stir in their graves at this latest use of one of their favourite words—he is quite consistent, and even logical, in his opposition. To M. Zola there is no literature save his own, and, in a fragmentary way, such literature as he has condescended to learn from. The critic who impartially attacks Victor Hugo and Théophile Gautier may very fairly add Alexandre Dumas to the list. We believe, however, that M. Zola is good enough to recognize the fact that Dumas has some claims to a statue, if only because he produced M. Alexandre Dumas *filis*. But it seems dreadful to him that the statue should be erected while Stendhal, Flaubert, Baudelaire, and M. de Goncourt are still statueless men. The literary merits of some of these persons we do not feel in the least inclined to contest. But it is an odd instance of the complete want of mental perspective which may be charitably taken to be at the bottom of most of the follies of the experimentalists that such an argument as that to which we have referred should be used. The qualifications which entitle a man to this particular honour must necessarily include wide popularity, or at least the right to wide popularity. Otherwise the statue is meaningless. It is not wanted by a small circle of devotees; it is a hieroglyph merely to the world at large. We are not quite certain that we should see the appropriateness of a statue to Keats, or to Charles Lamb, or to Blake, perhaps even to Shelley. All these authors will always give intense pleasure to a comparatively small number of persons disposed by nature and education to approve them; but the world at large, though it may obediently accept the estimate of their merit, will not feel it. Of the French authors mentioned just now—at least of those of them who have real merit—this is much truer. All of them were men who produced relatively or positively little work of merit, and the merit of what they did produce appealed to the few. These are exactly the conditions under which, we repeat it, a man should not have a statue.

Exactly opposite is the case with the author of *Les Trois Mousquetaires*—a phrase which we beg to leave to use intentionally and emphatically as equivalent to Alexandre Dumas. We doubt very much whether any man save Sir Walter Scott ever gave in the course of half a century so much of the pleasure which literature is capable of giving to so large a number of persons. It may not have been a very exquisite or refined pleasure; but then—in these days of democracy it is probably treason to hint it—it may be doubted whether the majority of mankind are capable of very exquisite and refined pleasure. But Dumas did more than this. He has given a vast amount of pleasure, too, to people who are very capable of receiving the exquisite and refined kind. He has, it is true, had probably more injustice done him than any contemporary author; but, if the doers of that injustice be examined, they will be found to be curiously uniform in character. The best judges like Dumas heartily; the general mass, who do not pretend to be judges at all, like him as heartily. It is the people who have just a smattering of criticism, the Wiggles and the Wagglers who disdainfully ask for "the old dry wine one used to get," who turn up their noses at Alexander the Great. The truth is that his art is a very artfully concealed art, and it is not very easy to get at its secret. If you will be content to be simply amused without bothering yourself about the sources of your amusement, Dumas is your man. If you are sufficiently expert in tracing these sources, he is your man too. But a few cut and dried rules of criticism and an obedient admiration of the authors most in fashion at this time or that will not enable you to find him out.

After all, it may be said, what is the object of worrying oneself about the *diatribe*, when the *stri* is so remarkably sure and certain? Set any man who has a genuine relish for novels, and who is not a prig or a milkop, down to one of Dumas's better novels, and ask him at the end of the day whether the author shall have a statue or not. This, after all, is the soundest test in such a case. For the eternal controversy

about moral purposes and the dignity of literature, and all the other stock old problems, hardly touches novels at all. The novel gives itself out frankly as something that is meant to please, to amuse, to pass the time agreeably. It was this very frankness and absence of pretension which long caused it to be frowned upon in serious circles. Poetry gave herself airs of inspiration and divine afflatus; drama talked about holding the mirror up to nature, and reforming the manners of men; but the novel was quite shameless in presenting herself as an agreeable companion only. It is true that of late years a certain sophistication has crept in; but still the main purpose, if it has sometimes been associated with others, has never been formally repudiated. Now, Dumas recognized this main purpose, and, what is more, accomplished it more fully and frankly perhaps than any other novelist of mark that could be mentioned. Short of an outrageous bilious headache or a complete ignorance of French, it is difficult to imagine any circumstance of ordinary life in which the Bastion of St. Gervais, the capture and boxing up of Monk; the last scene at Locmaria; the escapes of La Mole from the daggers of the St. Bartholomew butchers and the cord of the Valois Princes; half a hundred other scenes, which will present themselves at once to the memory of every Alexandrian, will not beguile and distract. Nor is the extraordinary abundance of the pastime provided to be left out of sight. An ordinary novelist gives us half a dozen volumes or half a score, or in some rare cases half a hundred; Dumas gives us half a thousand, or thereabouts. The suggestion that no pedestal will be wanted for the statue, but a pile of the works, is not a particularly sprightly joke, but as a proposition in arithmetic and mensuration it is a tolerably sober statement of fact; and this brings us to a weary old piece of spiteful cavi, the objection that all this enormous mass is not the work of its professed author. Let us take the bull by the horns, and say "Of course it isn't." Every laborious person—at least, so they say—who chooses to calculate the utmost possible amount producible in a certain time by a laborious writer may convince himself that Alexandre Dumas did not in one year write "copy" enough to bring him in forty thousand pounds at the tolerably moderate rate at which such work is paid in France. Every critic who knows his business can see that there are pieces, and very large pieces, which are not the work of the hand which did the rest, nor even of the same hand, as far as they themselves go. What does it matter? That what is good in Dumas is his own is obvious from the simple fact that it is quite individual, always recognizable, and not in the least like the independent work of those persons who are said to have assisted him—of whom, by the way, the most distinguished is on this very statute Committee. Now, if Dumas has a statue, that statue will assuredly be put up to him for his good work and not for his bad. That is to say, he will have it for his own work and not for other people's, which is all that the sternest moralist is at this time of day entitled to demand.

How good that work is nobody who knows it requires to be told, and no one who does not know it can be made to understand. There is something about Dumas as a novelist which reminds one of the famous definition of the philosopher, "second best in everything." He is not a great artist in words, and yet his descriptions and the like are always up to their mark; he is not a cunning analytic character-drawer, and yet his readers always feel that men and women, and not lay figures, are occupying their attention. He is frequently outrageous in his contempt of regular plot, yet the interest of all his best works—save only *Monte Cristo*—is sufficient to carry the reader on swimmingly to the end, and the best plotter in the world can do no more. As to his dialogue, it is perhaps hardly second best. In its kind it is quite perfect, and the only fault is that there is a little too much of it. The characters do not bombard each other with astounding epigram like the characters of Molière and Congreve; yet they are not often dull. They are not learned or philosophical, but they have plenty of mother-wit, which is much more to the purpose. Even when one has been finding fault with the separate ingredients of the books, it suddenly strikes one that the total effect could not be better of its kind. If you want other kinds you must go elsewhere. But, if you want this kind, there is none like it. People used to find fault with Dumas as being "improper," but fortunately his chief traducers have taken good care to wipe off that imputation. After the novels of the last twenty years in France the flocks in Dumas's books, never very serious ones, really require a microscope to enable one to discern them at all. Therefore all we can say is that, if the question, Shall Alexandre Dumas have a statue? be one to which England has any right of reply, England should certainly reply Yes. The great Alexandre had a few little prejudices about us, and he made us run away from his invincible musketeers in a manner which is in doubtful accordance with the facts of history. But perhaps because the facts of history rather reverse the representation, we have no difficulty in forgiving him for this. His countrymen may, if they like, talk about his son being his best work. On this side the Channel there is not much danger of the joke being echoed. Far be it from us to speak disrespectfully of a very clever and a very witty writer. But, with all respect to the Alexandre of to-day, he is not fit to hold a candle to his father either as a dramatist or as a novelist. As there can be no comparison between *Les Trois Mousquetaires* and *La Dame aux Perles*, so there is none between *Mlle. de Belle-Isle* and *L'Etrangère*. The novels certainly have stood the test of time, and it is difficult to believe that at

least some of them will not continue to stand it. For they are in the main dependent on things which are of perennial interest to the fighting, loving, travelling, adventurous animal called man. There is not, we think, much danger that anybody for a very long time to come will look at the Dumas statue and ask the question—fatal to the claim of existence of statues—"Alexandre Dumas? and who was he?" Now, with the utmost deference to M. Zola, we do think it possible that this might happen before a great many centuries are past in the case of M. de Goncourt.

THE DEFEAT OF BOSS.

IT is difficult to say whether society will be grateful to Mr. Richard Proctor for throwing light on the great game of Boss, by giving a method of ascertaining when the puzzle can be solved and when it cannot, and by further showing how to bring the figures into sequence when the first position is one which makes ultimate victory possible. For some time past Boss has been at once a torment and a pleasure to a very large number of more or less rational people. Perhaps no game of the kind has ever become so rapidly popular, and perhaps none has been so generally abused. It certainly interested more men and women than any other puzzle that has been produced in our time, and has perhaps caused more aggregate irritation than anything yet invented. Nobody could resist it, from the pert schoolboy of fifteen who often solved the puzzle to the testy old gentleman of seventy who invariably failed. It enthralled all, and it infuriated a great many; and it may be said with truth that it is the only known contrivance of man which can stop a woman's tongue. It is not impossible that its unparalleled success was in part due to the fact that it came at a time when many ingenious young ladies and gentlemen were thirsting for a new method of tormenting themselves. For long the acrostic-maker reigned supreme, the absolute tyrant of families. The time of a large number of people was—harmlessly perhaps to themselves, but certainly to the hideous discomfort of their unambitious friends—principally occupied in the perpetual asking of riddles set in jingling verse. But, after a considerable period, the acrostic-maker fell. As usual in the long run, the attack proved stronger than the defence. Industrious men and women applied themselves with such zeal to the solution of acrostics that they became in time more cunning than the contrivers, and the latter were reduced to illegitimate devices, which naturally deprived the conundrums of much of their interest. When acrostics were piling, Boss appeared, and the new torment was hailed with universal acclamation. It seemed for awhile as though a puzzle had been invented which would defy all comers; for, though it was well known that some positions were insoluble, no one could say what proportion the total of hopeless positions bore to that of soluble ones, nor was any method devised by which a winning or soluble position could be distinguished from an insoluble or losing one. Now Mr. Richard Proctor has dispersed the mystery and explained Boss. Moved, perhaps, by the prospect of a large increase in the number of the occupants of lunatic asylums, he applied himself to the game; and straightway Boss has fallen. As has been said, it is doubtful whether society will be grateful to him, as certainly there was great fascination in a game which nobody could quite explain; but whether his success is received with gratitude or not, it cannot be questioned. No mystery will attach to Boss in the future.

It is in the *Gentleman's Magazine* for the present month that Mr. Proctor explains how insoluble, or, as he terms them, losing, positions can be distinguished from winning ones, and how from a winning position the numbers can be rapidly brought into sequence. He has, it seems, previously explained the puzzle; but we gather that the explanation now given is fuller and more conclusive than that which has previously appeared. It is with the first part of it that we are principally concerned. Clearly the most important thing for a player at this game to know is whether the position of numbers given him to start from is of the soluble or insoluble order—that is to say, whether from it the numbers can or cannot be worked into the desired sequence. It has, as we have said, been known for some time that there were a certain number of insoluble positions, and a few of these have been given in so-called keys to the puzzle; but the total number, hitherto unknown, will probably astonish Mr. Proctor's readers not a little. Boss—or, to use his more scientific language, the Fifteen Puzzle—admits, he says, of 20,922,789,888,000 distinct positions. Of these, half are winning and half are losing positions. Mathematicians are fond of piling up big figures, which usually leave no very vivid impression on the mind; but in this case Mr. Proctor will assuredly scare not a few of those who study his pages. There is something appalling in the thought of ten millions of millions of losing positions. Let it be supposed that every one of these indicates five minutes of intense annoyance on the part of some unsuccessful player. What interminable years of suffering are suggested by Mr. Proctor's terrible statement! Then it is startling, and at the same time not a little gratifying, to think what a chance the *chevaliers d'industrie* have lost. If they had only mastered the subject as Mr. Proctor has, they would have had ten millions of millions of chances of taking in their fellow-creatures; and, as a moderate amount of such skill as is required for tricks at cards would enable a man to place the Boss numbers in an insoluble position, while seemingly throwing them down at haphazard, it may fairly be said that the noblest

field ever yet open to the swindler has been entirely overlooked. Other singular considerations are suggested by the figures given, but into these we cannot now enter. What will most interest the ordinary student of Boss, after his first surprise is over, will be the method by which the 10,461,394,944,000 pitfalls can be avoided, and the corresponding number of safe ways discovered. Of this, as described by Mr. Proctor, we will endeavour to give a brief account.

He begins by stating the obvious fact that any position which can be obtained from the won position—i.e. the position in which the numbered blocks are in numerical sequence with the right-hand corner square blocks—must be a winning position, because, by reversing the order of movement, the blocks can be worked back to the won position. He takes twelve of these and shows that, in each case when the total number of what he first terms displacements, and then discrepancies, is even, the line in which the vacant space occurs is even, and that when the number is uneven the line is uneven. By discrepancies Mr. Proctor means the cases in which numbers precede a number which, in regular sequence, they would follow. Thus, for instance, in the line 1—7—9—2 there are two discrepancies, as 2, which follows, should precede, 7 and 9. With regard to the lines, of course the first or top line is uneven, the second even, the third uneven, the fourth even. The rule suggested by the examination of these twelve positions is evidently that when the whole number of discrepancies and the number of the line with the vacant space are both even, or both uneven, the position is soluble. How this rule is to be applied in practice is best shown by the example which Mr. Proctor gives. He takes the following arrangement of the blocks:—

9	14	12	4
5	1		8
3	7	15	2
13	10	6	11

The vacant square, it will be observed, is the third one of the second line under the square occupied by number 12 of the first line. The summing up of the discrepancies is as follows:—

12	which follows should precede	Discrepancies
4	" " 9, 11, 12	3
5	" " 9, 11, 12	3
7	" " 9, 14, 12, 4, 5	5
8	" " 9, 14, 12	3
3	" " 9, 14, 12, 1, 5, 8	6
7	" " 9, 14, 12, 8	4
2	" " 9, 14, 12, 4, 5, 8, 3, 7, 13	9
13	" " 14, 15	2
10	" " 14, 12, 15, 13	4
6	" " 9, 11, 12, 15, 7, 15, 13, 10	8
11	" " 14, 12, 15, 13	4
Total discrepancy		32

Thus the total discrepancy is even, and the vacant line is also even; so that, if our suggested law is correct, the position should be a winning one.

This example shows clearly what Mr. Proctor's meaning is, and after giving it, he proceeds to demonstrate that, from the position which has been shown, no possible working of the squares, according to the rule of the game, can have other result than an even number of discrepancies and an even vacant line, or uneven discrepancies and an uneven line; and states the following final conclusions:—

Since, then, in the won position the total discrepancy (0) is even, and the vacant line (4th) is also even, in every position deducible from the won position or reducible to the won position, the total discrepancy and the vacant line are either both even or both odd. And therefore no position in which the total discrepancy is even and the vacant line odd, or *vice versa*, can possibly be a winning position.

For most players this will be enough, as they have a rule by which they can ascertain whether any position set before them is a winning or losing one; and though the rule may not have been proved, strictly speaking, to be true, at all events a very strong presumption has been raised in its favour. Mr. Proctor, however, as becomes a scientific man, is not satisfied with this result. He is determined to do a great deal more, and to solve the whole problem of the game exhaustively. He doughtily says:—

We have proved that from none of the multitudinous positions (one-half of the total number) in which the total discrepancy is odd and the vacant line even, or *vice versa*, can any position be obtained in which the total discrepancy and the vacant line are either both even or both odd; also, that from not one of the multitudinous positions of the latter kind (say the winning kind) can one of the former kind (say the losing kind) be obtained. But we have not yet proved that from any position of the winning sort any other position of the winning sort, including the won position, can be obtained; or from any position of the losing sort any other position of the same sort, including the lost position.

We cannot possibly prove either of these relations experimentally, for the simple reason that there are more than ten millions of millions of positions of the winning sort, and as many of the losing sort.

Yet it is not difficult to prove that from any winning position any other winning position, and from any losing any other losing position, may be obtained.

This proof he proceeds forthwith to give; and in giving it, shows the system on which the game is to be played. In this exposition we cannot follow him, as his reasoning, which is of considerable length, cannot be stated in a summary, or made clear without numerous diagrams. Those who wish to master the game of Boss or to gain any clear idea of how it may be mastered must study the *Gentleman's Magazine*. The task of students, we may observe, will not be a light one. Mr. Proctor's statement of his proofs is singularly obscure, and in places most difficult to follow.

Many of his readers will most devoutly wish that he would "explain his explanation"; and no doubt in time he will do so, giving an amplification of his present essay, which will be more or less clear to all. At present, however, most creditable work can be done by any Boss player whose devotion to the game is sufficient to make him grapple with the ambiguities of Mr. Proctor's statement and master the system by which from winning positions the final won position can be quickly reached. How to distinguish those positions has been already indicated, but it may be well to give the rule as stated by Mr. Proctor himself at the end of his article. His words are as follows:—

If the number both of horizontal and vertical rows be even (as in the Fifteen Puzzle), the won position, in which the blocks succeed each other in numerical sequence, following the lines as in reading, and leaving the last square vacant, can be obtained from any position in which the "total discrepancy" and the number of the partly vacant square [line] are either both even or both odd; but if the "total discrepancy" is even and the number of the partly vacant line odd, or *vice versa*, the won-position cannot be obtained.

This is clear enough, and with attention and study, and perhaps some further assistance from Mr. Proctor, the proof of this rule and the system by which the game can be mastered will be made equally clear to the zealous player. Whether, however, the game will have its old attractiveness now that Mr. Proctor has explained and analysed it is extremely doubtful. What made it at once so delightful and so exasperating was the constant possibility of utter defeat. Rarely could a player be quite certain that Boss was not laying a trick for him, and would not be true to his name and prove master in the end. Now this is all over. There will be no more uncertainty. Mr. Proctor has defeated Boss, and perhaps Boss will not for long survive his defeat.

TRADE IN 1880.

THE year which has just ended has been one of steady, uninterrupted, and solid improvement in trade. It is quite clear now that the explanation offered by Mr. Giffen twelve months ago of the revival that set in so unexpectedly in the autumn of 1879, in spite of perhaps the worst harvest of the century, was the true one. The preceding depression had been overdone by an exaggerated amount of discredit and apprehension. To a far larger extent than economical writers generally have realized, states of trade depend upon states of mind in the business community. Credit is as the breath of life to trade, and when people are doubtful as to whether it is prudent to trust any one, trade as a matter of course must be depressed. The result of the Glasgow Bank crash was to produce almost universal distrust, and the necessary consequence was that production fell behind the demands of current consumption. A reaction, therefore, was inevitable, and it was stimulated and augmented by the recovery of the raw-material-producing countries, more especially the United States. Twelve months ago there was a fear that the improvement thus set going would collapse from the effects of the unhealthy speculation which accompanied it, but the fear has proved groundless. The speculation died out; but the trade revival continued, becoming strengthened and consolidated as it became more gradual and natural. It is hardly necessary to adduce proof of the reality of the revival, and data do not yet exist for measuring very exactly its magnitude; it may be worth while, however, to cite a few figures, for the sake of getting a more definite notion of how far the movement has yet proceeded. From the Board of Trade returns for November we find that, for the first eleven months of 1880, the value of the imports, compared with their value for the corresponding period of 1879, has increased about fifteen per cent.; while the value of the exports increased about seventeen per cent. The December return will not appear till the end of next week, but we need have little hesitation in predicting that it also will show improvement. It was in the foreign trade that the revival first manifested itself, but it has by no means been confined to the foreign trade. The railway traffic returns are justly regarded as a very accurate index of the condition of the country. It is clear that the receipts from the carriage of goods, for example, cannot be increased unless a larger quantity of goods is carried, or a higher charge is levied, or unless both causes co-operate. But if a higher charge is levied, and proves more productive, it can only be—when the whole country is in question, and therefore special causes are eliminated—because trade can bear higher charges, or, in other words, is more profitable. But in sixteen selected British and Irish railways we find that in the first twenty-five weeks of the second half of 1880 the traffic receipts had increased 1,030,000*l.*, the goods traffic contributing 636,000*l.*, or almost two-thirds, of the increase. Lastly, to refer to only one other piece of evidence, employers are beginning to concede an advance of wages to their workpeople. Early in the year the cotton-spinning operatives of North and North-East Lancashire obtained a rise of wages, but the weavers failed, although they threatened to strike in order to exact for themselves what had been given to the other branch of the trade. Quite recently, however, the advance previously refused, on the ground that it could not be afforded, has been voluntarily given. Here, then, we have unquestionable proof of greater prosperity. In Durham, again, the miners have had their wages raised, and in several lesser instances there have also been concessions, while the feeling is almost universal that a general rise is impending.

We might add to these pieces of evidence extracts without number from trade circulars and market reports, but we have said enough to establish the fact, with which alone we are here concerned now—that trade has continued to improve all through the year.

The revival has been accompanied, of course, by a rise of prices; but the rise has been far more general and more considerable in securities than in commodities. This is natural. A rise of prices in commodities cannot be sustained for any length of time by mere speculation. But such an increase of consumption as would justify a great rise of prices must in the nature of things be gradual. In ordinary articles—those, for example, whose price is mainly determined by the prosperity of the great body of the people—increased consumption has to wait, first for the employment of the whole of the working classes, and then for a rise of wages. It is not until labour is becoming scarce and wages are running up rapidly that prices mount, as they did, for instance, in the inflation years that followed the Franco-German war. As regards, again, what are called the instrumental commodities, such as iron and coal, consumption abroad must exceed production abroad before it can act very appreciably upon prices here in England. Twelve months ago the consumption of iron in the United States momentarily exceeded the production there, and there was a rise of the price here at home “by leaps and bounds.” But after a while the production in the United States was stimulated by this rise, and overtook the supply. In the opinion of many competent observers, the consumption will never again outstrip the production; but this is travelling beyond our present purpose, which is only to point out why the rise in securities should necessarily be quicker than that in commodities. The organization of the stock markets lends itself more readily to speculative dealing, and, moreover, the consumption is more universal. The real consumers of iron are comparatively a limited class, but nearly every one who saves is a purchaser of securities. It was inevitable, therefore, that the rise in the latter should be not only greater than in the former, but that, to borrow the language of the Stock Exchange, it should fully “discount the future”; in other words, should be ahead of the actual situation, and abreast of the calculations of the shrewdest and most far-seeing capitalists. Two elaborate articles which have appeared in the *Statist* during the past month, and which support their statements by tables involving an immense amount of labour, enable us to show what the rise in each case has been. Taking securities dealt in upon the Stock Exchange, which were in August 1879 of the aggregate market value of 1,575 millions, the writer of the first article shows that early last month the value had risen to 1,846½ millions. The rise that took place in the autumn of 1879 is included here, while the movement of the past three weeks is not taken into account. But our object just now is not to measure exactly the advance from one New Year's Day to another, but to show the direction and momentum of the course of prices during the year which has just closed, and for this purpose the figures we have cited are as good as if the comparison was between the last weeks in December in each year. It will be noticed that the writer in the *Statist*, being unable to find space for all the securities dealt in upon the Stock Exchange, was obliged to confine his calculations to the principal ones, representing roughly in value about one half of the whole; and he finds that the rise of price in these in about fourteen or fifteen months amounted to the enormous sum of 271 millions, or considerably more than the indemnity paid by Franco to Germany. It may be said that this addition to the value of the property of British and Irish bond and share holders in consequence of the revival in trade is imaginary, that it is nothing more than a book entry of the same property in higher figures; but this is not quite so. No doubt, to some extent, the augmented value is only a book credit. But, on the other hand, it is to a large degree real and tangible. We showed above that in the half-year just ended sixteen home railways earned considerably more than a million over and above the earnings of the corresponding half of 1879, and these increased earnings are for the most part clear profit, because the working expenses have not been swollen by higher wages and prices. The increased price of railways, then, is based upon increased incomes. In the same way, the banks have all been doing better. So have the cotton companies, as we said above, and the iron companies, the tramways, and so on. The same thing holds of shipping companies, telegraphs, and the like. In short, it is true generally that, in consequence of the revival of trade, all industrial enterprises are more profitable, and for that reason are worth higher prices, though, of course, we do not mean to imply that in every case the rise has been in exact proportion to the augmented value, but only that it is based to a greater or less extent upon an augmentation of value. Nor is it only industrial enterprises that are more profitable. The good seasons which have revived trade in the raw-material-producing countries have also restored their tax-paying powers, and consequently improved their credit, while the political settlement of Egypt has still further raised the value of its bonds. Granting, then, all that can truly be said about speculation and fictitious values, it will be seen that much of the rise is as real as the rise in the value of agricultural land that always attends upon a series of good seasons. Returning to the article in the *Statist* we find, as was to be expected, that the rise is greatest in industrial concerns. Thus in Government Stocks, home and foreign, it was only 14½ per cent.; but in home railways it was 22 per cent.; in miscellaneous, 33 per cent.; in banks, 37 per cent.; and in foreign railways, 49 per cent.

In commodities the movement of prices has by no means been

uniform. It is startling to find from the second article in the *Statist* that the price of steel and of steel and iron is actually lower now than in the first eight months of 1879—that is, before the American purchases began, and when the depression seemed at its worst. It is to be borne in mind, however, that the new method of steel-making greatly cheapens the cost of production. There is likewise a fall in the price of horses, of books, of leather, of glass of all kinds, of linen and jute yarn, of paper, salt, manufactured silk, woollen cloth, and woollen yarn. But in general there is a marked advance, as, for example, of 15 per cent. in rails, of 19½ per cent. in bar iron, 30½ per cent. in pig iron, and 46 per cent. in old iron. There is also a rise in all kinds of manufactured cotton, in coals, in copper, brass, lead, zinc, and tin, in wool, woollen yarn, worsted, and carpets. But the most remarkable fact brought out by the article is that prices are still below the level of 1861. That was a year of very low prices, when the depression that followed the crisis of 1857 had reached the lowest point. It is, therefore, not a little surprising to find that, in spite of the trade revival, prices are still below the level of that year. One explanation is that, owing to a growing scarcity of gold, prices will henceforth be permanently lower than they were at a time when gold was superabundant. But this is a proposition to discuss which would lead us too far afield. It is enough to say, for the present, that the revival of trade which we are considering has not yet gone far enough to act very perceptibly on the prices of commodities. As we pointed out above, the movement for an increase of wages is only just beginning, which is but another way of saying that the improvement in trade has hitherto been barely sufficient to give full employment to the working classes. But, until the working classes have for some time been in full employment, their buying cannot have any great effect upon prices. Another thing to remember is that agriculture is still suffering severely. Farmers are unable to employ labour as formerly, or to pay their rents promptly; and landlords consequently are also not in a position to spend freely. It seems probable, therefore, that the movement of prices in commodities is but just beginning. The trade improvement continues and is gaining strength. It must bring with it a rise of wages. And in turn a rise of wages must cause a rise of prices, both because it adds to the cost of production, tends to swell the circulation, and so to enhance the value of money, and augments greatly the purchasing power of the working classes. But how far the rise of prices will go depends upon many causes the operation of which it is impossible to calculate.

THE THEATRES.

AT the Princess's Theatre Mr. Booth has followed his powerful representation of Richelieu by a performance which in some important respects is even more powerful of Bertuccio in the late Mr. Tom Taylor's play *The Fool's Revenge*. This piece was founded, as will be remembered, upon M. Victor Hugo's *Le Roi s'amuse*, a play which it has not been given to many of the present generation to see performed upon the stage, but of which the outlines have been made familiar to opera-goers by means of Signor Verdi's *Rigoletto*. The original piece has, it is hardly necessary to say, much of the grandeur of which M. Victor Hugo is among living poets and dramatists the master; but it has also some of the faults which are characteristic of his work, and one at least of which Mr. Tom Taylor got rid of with some success. The final scene of *Le Roi s'amuse* is at best curiously inartistic, and seems to have an echo of the pre-Shakespearean time, when any kind of horror was invented by playwrights and tolerated by audiences. A scene in which a half-dead girl, rising out of a sack into which she has been thrown for dead, holds colloquy with her father, who has imagined that the sack contained the corpse of the tyrant at whose life his revenge had aimed, is obviously unfitted for dramatic purposes as they are now understood, and as they were understood in the time of Horace. Mr. Tom Taylor did well from a modern dramatist's point of view in expunging this scene; but he might perhaps have avoided expunging with it the finest speech in the whole play, which is also perhaps one of the finest dramatic speeches which M. Victor Hugo has written. The characteristic figures of Saltabulil (the Sparafucile of the opera) and his daughter also disappear in *The Fool's Revenge*, and the motive of the play is weakened by the fact that it is not the King, or the Duke, himself upon whom the jester longs to be revenged, but one of his Court, the Count Malatesta, who had in his youth seduced the jester's wife. This in a certain sense takes away, as probably it was intended to do, something of the savagery of Triboulet's or Bertuccio's character; but the substitution of an attempt at gratifying a special grudge in the meanest possible way for the ferocious delight of indulging his hatred for the Court in general is not altogether commendable. St. Vallier's curse also disappears, and with it that sense of impending horror which, in M. Victor Hugo's play, oppresses the jester in his anticipation of triumph. But it would be tedious to point out in detail all the differences between *Le Roi s'amuse* and a play which Mr. Tom Taylor was careful to describe in a preface to the published version as being “neither translation nor *refacimento*.” The notion, upon which the play depends, of the jester's double life and of his schemes of vengeance recoiling upon his own head, is of course taken from M. Victor Hugo, and, granting that Mr. Tom Taylor was right in taking this notion only and working it up after his own fashion, it must be

admitted that his knowledge of stage effect stood him in good stead in his carrying out of his intention. Mr. Tom Taylor, excellent playwright as at his best he was, was less happy in the writing of verse than of prose; but this is of the less importance since, from the utterance of most of the players who support Mr. Booth, it would be difficult without previous knowledge to arrive at the conclusion that they were speaking verse. For Mr. Booth's own performance, with a few exceptions, we have nothing but praise. We have said that his performance of this part is in some respects more powerful than his Richelieu. Richelieu is a tolerably familiar part, with strongly marked passages which are expected by the audience, and which can hardly fail to produce their due impression if they are given with any power. Bertuccio is a part with which comparatively few playgoers are acquainted, and in which very much depends upon the player's imagination as well as upon his execution. In a certain sense, of course, every important part depends for its success in interpretation upon the imagination of the person who interprets it; but in some such parts, and markedly in Richelieu, a theatre-goer who ran over the play before seeing it acted would be able to make a tolerable guess at the kind of effect which the player would aim at. To illustrate our meaning by one instance, there is the well-known "curse of Rome" speech in *Richelieu*, to the directness of which scarcely anything, except perhaps the speech at the end of the first act in *The Fool's Revenge*, corresponds. This speech, ending with the lines

Vengeance swells out my veins, and lifts my head,
And makes me terrible! Come, sweet to-morrow,
And put my enemy's heart into my hand
That I may gnaw it!

was given with great, even with surprising, power by Mr. Booth; but perhaps his finest acting was seen in passages where the text gives hardly any hint of the effect which the actor produces. Highest among these effects we should be inclined to place Mr. Booth's acting in the last scene but one of the play. Here, among many admirable touches, one which is especially audacious, and especially successful, is found in his entreaties to Torelli to take him into the room where, as he now knows, his daughter, and not the Countess Malatesta, is imprisoned. He dances round Torelli with a wild exaggeration of the jester's manner, which at last gives place to an utter and deeply tragical abasement of supplication. With the exception of some touches in Mr. Irving's *Mathias*, we cannot remember to have seen within the last few years any piece of acting at once so daring and so successful as this. The least step in the wrong direction would make it at once the opposite of what, as Mr. Booth executes it, it is. In other passages which are more or less of the same kind, but which make less demand upon the actor's capacity for at once expressing and controlling a storm of conflicting emotion, Mr. Booth is, as it seems to us, markedly successful. In one scene only to our thinking he fails, and in that the failure is partial. This is the scene with his daughter in the second act. Here, with considerable tenderness, Mr. Booth yet employs the same form of expression too often—so often, indeed, that he comes dangerously near to monotony. The indrawn sobs, which are at first effective and pathetic enough, lose something of their effect by too frequent repetition. The actor's technical skill is strikingly exhibited in this character. Never forgetting that Bertuccio is hump-backed and bow-legged, Mr. Booth yet contrives to display a most interesting combination of grace and grotesqueness. Such apparently trifling actions as the kicking over of the flagons in the last act are just the actions which only an actor of thorough training can accomplish with the effect that Mr. Booth gives to this as to other merely technical matters throughout the play. It may be presumed that the principal actor is responsible for the picturesque and ingenious arrangement for the change of scene in the last act—an arrangement which, however, is notwithstanding its risks, as was shown on the night when we were present. Mrs. Hermann Vezin plays Francesca with force and discretion, and Miss Gerard acts the jester's daughter, Fiordelisa, with grace and with good intention. There is not much to be said in praise of the other players concerned in the piece. They would do well to learn amongst other things that Manfredi does not rhyme to Macready, and one of them at least should remember that Malatesta does not assume a final *r* before a vowel.

At Sadler's Wells Mrs. Bateman is entertaining her audiences with a revival of *The School for Scandal*, the interest of which depends chiefly upon the acting of Miss Virginia Bateman as Lady Teazle, Mr. Charles Warner as Charles Surface, and Mr. Hermann Vezin as Sir Peter. Miss Bateman's performance is full of spirit and intention, and in the screen scene she rightly aims at and reaches pathos. Mr. Charles Warner ruined the effect of some excellent acting on his own part in this scene by the inexcusable blunder of taking a "call" after his exit. In earlier scenes Mr. Warner's unlagging vivacity and good humour made one condone some faults which experience will probably remove. In the dinner scene, which is capitally arranged, and in which Mr. Wheatcroft sings "Here's to the Maiden" with much spirit and spontaneity, Mr. Warner is at his best. Mr. Vezin's Sir Peter is curiously dry and disappointing. The play is well mounted, and the stage management is excellent.

Valentine and Orson, the pantomime written by Mr. F. C. Burnand for Covent Garden, would probably have made its mark without the curious and ingenious variety of advertisement which heralded and accompanied it. As far as dialogue goes, it is not perhaps of much importance that Mr. Burnand rather than another wrote it, since, except in the case of

the Vokes family, all of whom are actors as well as mimes, the dialogue is chiefly dumb show. But it is of importance that a writer of Mr. Burnand's stage knowledge should have contrived the plan of an opening which follows closely the lines of an "ever charming, ever new" story, and yet gives plenty of scope for pantomime in the best sense. Miss Vokes's Valentine is of course graceful and spirited, and her share in the caricature of the *Cornican Brothers* dual is capitally executed. Mr. Vokes, who plays Orson, has lost nothing of his power of combining acting with agility, while the prestance of his legs is, if possible, more imposing than ever. Amazing feats of agility are performed, mostly in the scenes in which Mr. Vokes appears, by Master Lauri, who has also considerable talent as a mime. Master Lauri will not, we hope, remain a mere acrobat. His talent seems worthy of ranking with that of the Hanlon-Lees. The comic business is throughout admirable, and at least one scene of the harlequinade has real merit and invention. The scenery is artistic and most effective. The transformation scene is imaginative and brilliant, but suggests, in its multiplicity of living lights, some unpleasing possibilities.

REVIEWS.

MEMOIR OF CHARLES JOHN HERRIES.*

THE delicate reserve which has induced Mr. Herries's sons to exclude from the present Memoir all notice of his private life and character is perhaps to be regretted. Few abler public servants lived in his time, and none were more conscientious and upright; but Mr. Herries enjoyed no popular notoriety; and his solid and valuable services are, with other events of the same date, generally forgotten. It would have been easier to revive the interest of the present generation in his character and history by some personal account of his life than by a dry record of public transactions; and the object of the biography would therefore have been most effectually attained by a deviation from the course which has been deliberately selected. The difficulty is, not to refute the calumnies to which Mr. Herries's reputation has been subjected, but to obtain a hearing. The book would, it appears, never have been written but for some ill-considered passages in Mr. Walpole's recent *History of England* since 1815. Mr. Edward Herries conclusively disproves charges which are only partially supported by certain passages in Lord Palmerston's *Autobiography* and in Mr. Greville's *Memoirs*. It is to be hoped that an early opportunity will be taken to make due reparation and apology. It would be absurd to affect a suspension of judgment till Mr. Walpole has had time to justify accusations which are clearly baseless. In one of his notes Mr. Walpole cites alleged authorities for his narrative of a proceeding which he designates as "this strange intrigue." The corresponding text relates nothing which can properly be described as either a strange or an ordinary intrigue. From some contemporary lampoon, probably published in the *Morning Chronicle* at the instigation of Mr. Herries's bitter enemy, Mr. Tierney, Mr. Walpole quotes with inverted commas the description of Mr. Herries as a "Tory Clerk." He then proceeds to repeat in his own person the ridiculous and offensive libel on the most experienced financier then living in England, the confidential adviser of Lord Liverpool, Mr. Vansittart, and Mr. Robinson, who had for some years sat in Parliament as Financial Secretary of the Treasury. The author of the biography is perhaps excessively, though excusably, severe on Mr. Walpole's unfortunate mistakes, which may probably be ascribed only to carelessness and to imperfect knowledge of the period. But an historian ought to have been on his guard against the misrepresentations of party pamphlets and newspapers, which were never more unscrupulously circulated than in the days of George IV. Mr. Walpole's error is the more surprising because Mr. Herries was first introduced into the conduct of important business by Mr. Perceval, whose entire confidence he enjoyed. It is evident that Mr. Walpole was wholly ignorant that, as Chief Commissioner during the later part of the war, the "Tory Clerk" had directed the expenditure of forty millions on supplies to the army, and that in a single year he procured by complex operations the means of making specie payments to the amount of twenty millions. He was entrusted with the negotiations for payment of subsidies to thirty-four different States, ranging in importance from Austria, Prussia, and Russia to Lippe-Schaumburg and Reuss-Greiz. He managed the coinage of enormous sums of gold, not only in English guineas, but in Hanoverian money, and even in French louis d'ors; and when his accounts were closed, several years after the war, his services, for which he declined special remuneration, were cordially acknowledged by the Ministers and in the House of Commons. When Mr. Walpole's "strange intrigue" resulted in Mr. Herries's appointment as Chancellor of the Exchequer, the funds immediately rose, and several capitalists declared that they would have ceased to hold English stock if any other Minister had been substituted. The detailed proof of these facts in the first volume of the Memoirs will furnish original

* *Memoir of the Public Life of the Right Honourable Charles John Herries, in the Reigns of George III., George IV., William IV., and Victoria.* By his Son, Edward Herries, C.B. With an Introduction by Sir Charles Herries, K.C.B. London: John Murray. 1880.

and valuable materials to any future student of the financial history of the time. Incidentally, it will perhaps convince Mr. Walpole that before he attacked the character of Mr. Herries he ought to have made himself acquainted with the rudimentary facts of his career. It is unfortunately but too probable that ordinary readers will be repelled by the dry and complicated history of elaborate financial and commercial arrangements. Only one or two lively episodes vary the dullness of official correspondence. Mr. Edward Herries corrects an utterly incredible legend of Sir W. Napier's, to the effect that Lord Wellington collected all the forgers and utterers of false coin in the ranks of the army, and contrived with their aid to fabricate French money which passed as genuine. The real coiner was Mr. Herries; the engraver was Mr. Wyon of the Mint; and the previous consent of Louis XVIII. had been formally given. In his arrangements for collecting specie at all the commercial centres of the Continent, not excluding Paris, Mr. Herries was efficiently aided by Mr. Rothschild, the founder of the celebrated firm and family. When certain Whigs were intriguing against the appointment of Mr. Herries as Chancellor of the Exchequer, the *Morning Chronicle* was induced to publish a mendacious statement that the Cabinet had found the nomination impossible in consequence of the connexion between Mr. Herries and the house of Rothschild. Lord Lansdowne indignantly repudiated the calumny, which was still more effectually refuted by the confirmation of Mr. Herries's appointment. His relations with Mr. Rothschild had been formed and employed exclusively for the good of the public service.

Mr. Herries was born of an old family in a good social position; but the bankruptcy of his father, well known as Colonel of the Light Horse Volunteers, left him at the age of twenty with no provision except a clerkship in the Treasury. A post in the same office of 300*l.* a year was soon afterwards placed at his disposal by the singular and characteristic disinclination of the other clerks to become candidates for a place of hard work. After serving for a time as private secretary to Mr. Vansittart, then Secretary of the Treasury, he was promoted to a similar employment under Mr. Perceval, who increased his income by the gift of some petty revenue places. In 1811, at the age of thirty-three, Mr. Herries was appointed Chief Commissary; and he retained the office till it was abolished in 1816, when he became Auditor of the Civil List. In 1823 Lord Liverpool procured his return for Harwich, for the purpose of securing his services as Secretary of the Treasury; and for the next four years he did much of the hard work of the financial department, of which Mr. Robinson was, as Chancellor of the Exchequer, the ostensible chief. On the retirement of Lord Liverpool, Mr. Herries adhered to Mr. Canning, though in political opinion he continued to be a Tory. The Catholic question was, as in Lord Liverpool's time, left open; and Canning required all his colleagues, including his new Whig allies, to pledge themselves against Parliamentary reform. Lord Palmerston, in an autobiographical sketch published by Lord Dalling, states that he accepted from Canning the offer of the Chancellorship of the Exchequer, but that some time afterwards Canning told him that he found it convenient to retain the office himself in conjunction with the Treasury. Lord Palmerston adds that the King hated him, and wished Herries to be Chancellor of the Exchequer, or that Mr. Canning should hold the office, so that the practical work might devolve on Mr. Herries as Auditor of the Civil List. "There were," according to Lord Palmerston, "questions coming on about palaces and Crown-lands which the King was very anxious about, and he wished either to have a creature of his own at the Exchequer, or to have the office of Chancellor of the Exchequer held by the First Lord." Mr. Edward Herries clearly proves that Lord Palmerston, probably at a considerable interval of time, entirely mistated the facts. The Chancellorship of the Exchequer was not offered to Mr. Herries, nor could he have been Auditor of the Civil List, since the place was, as Lord Palmerston must have known, incompatible with a seat in Parliament. The Secretary at War had for four years sat side by side in the House of Commons with the Secretary of the Treasury whom he represents as still a member of the non-political Civil Service. Mr. Canning had, in fact, asked Mr. Herries whether he would continue to serve under Lord Palmerston; and, on receiving a distinct refusal, he had said, "Then there is an end of the matter." It is possible that this short conversation may explain Mr. Canning's change of purpose with reference to the disposal of the Exchequer. Lord Palmerston is also responsible for an inaccurate account of later transactions in which Mr. Herries took a prominent part. On the death of Canning, Lord Goderich, who succeeded him by desire of the King, offered the place of Chancellor of the Exchequer to Mr. Sturges Bourne. On his refusal, the Minister, still by the King's desire, made the offer to Mr. Herries, who at first declined it with a strong recommendation that it should be given to Mr. Huskisson. The King afterwards personally proposed the appointment to Mr. Herries, who accepted it on Lord Goderich's distinct statement that he was, as First Minister, responsible for the nomination. The Whig members of the Cabinet afterwards persuaded Lord Goderich to hesitate in conferring the appointment, partly through dislike of Mr. Herries, and also in connexion with an effort which they were making to introduce Lord Holland into the Cabinet. Mr. Herries repeatedly offered to relieve Lord Goderich of his undertaking, and at one time he expressed his willingness to retain his office of Secretary of the Treasury under Mr. Huskisson as Chancellor of the Exchequer. The libel in the

Morning Chronicle compelled him to place before Lord Goderich the alternative of confirming the appointment as Chancellor of the Exchequer or of losing his services. Eventually Lord Goderich, perhaps under pressure from the King, complied with Mr. Herries's terms, and he became Chancellor of the Exchequer, while Lord Lansdowne and the other Whig Ministers who had threatened to resign remained in the Cabinet. The biographer shows that there was no question about parks or palaces; and he also confutes an injurious piece of gossip published in the *Greville Memoirs*, to the effect that Mr. Herries had ingratiated himself with the King "by transacting some of his pecuniary business, getting for him odds and ends out of *droits*, &c." There was no reason why Mr. Herries should not help the King in the transaction of his private business, though there is no proof of the fact; but he could assuredly not have transferred to him any *droits* or other funds which were public property. The "*droits*, &c." had, after a debate in the House of Commons, been added to the Civil List, and, if they passed through Mr. Herries's hands, he would have been guilty of universalism if he had not paid them over to the lawful owner. It is not even certain that Mr. Greville intended to convey the insinuation which is repeated by Mr. Walpole; but Mr. Greville, who probably knew nothing about *droits* and similar payments, received his information from Mr. Herries's implacable enemy, Mr. Tierney, who was thoroughly familiar with the subject.

Another of Lord Palmerston's statements is to the effect that the King placed Mr. Herries in the Cabinet as a live shell to explode when it might be convenient. As Mr. Herries's biographer forcibly remarks, the King had no need to adopt any indirect or circuitous course for ridding himself of a Ministry which he need not have appointed. He had preferred Canning to Wellington and Peel, who could even in the lifetime of their great rival have commanded a majority in Parliament. The King apparently liked the feeble and manageable Goderich better than the Tory leaders, and especially, at that time, than the Duke of Wellington, though he wished to limit as narrowly as possible the numbers and influence of the Whig contingent. The final disruption was caused partly by Lord Goderich's pressure for the admission of Lord Holland into the Cabinet, and perhaps also by the difference between the Chancellor of the Exchequer and the leader of the House of Commons, in which Mr. Herries was clearly in the right. Without consulting him, Lord Goderich and Mr. Huskisson, at the instigation of Mr. Tierney, offered to Lord Althorp the place of Chairman of the Finance Committee, which Mr. Herries had originally proposed to Mr. Canning. No Chancellor of the Exchequer who regarded his personal or political honour could have submitted to such a slight. Mr. Herries tendered his resignation unless the nomination of Lord Althorp was withdrawn; and he steadily refused to release the Prime Minister from the responsibility of a decision by an unconditional resignation. While Lord Goderich, according to his custom, was hesitating, the King suddenly sent for the Duke of Wellington, who formed a strong Government by including the followers of Canning. Mr. Herries, though he again was admitted to the Cabinet, was relegated to the subordinate office of Master of the Mint, being, therefore, as the biographer truly says, a loser by the transaction which he was supposed by his enemies to have contrived. The whole history of their proceedings is told at great length, with the result of entirely acquitting Mr. Herries of all blame or suspicion. Mr. Edward Herries is a vigorous and skilful writer, and a considerable part of his work is devoted to a vindication of the party to which his father belonged. Those who are interested in the history of the time will find much information in a narrative which is necessarily desultory, as it follows the intermitting course of Mr. Herries's public activity.

After the fall of the Duke of Wellington's Government, Mr. Herries remained a moderate member of the Opposition, though he seems scarcely to have been on cordial terms with Sir Robert Peel. His authority on questions of economy and finance was generally recognized. Lord Ashburton said that he was the best financier with whom he had ever transacted business; and Lord John Russell expressed nearly the same opinion. When the Whigs were defeated in 1846, Mr. Herries unfortunately lost his seat for Harwich, which he had held against Whig opposition for more than twenty years. Sir Robert Peel made his exclusion from Parliament an excuse for not including him in the Cabinet, though, as soon as all the offices were filled, he offered him a seat, which Mr. Herries declined. After remaining for several years in retirement, he returned to the House of Commons in time to become President of the Board of Control in Lord Derby's first Administration. He died in 1855 at the age of seventy-seven, after a laborious, useful, and honourable life. He may be considered fortunate in the literary ability of his natural defender, though it was scarcely to be expected that a controversy should arise in a later generation on the character of a statesman who would not have claimed for himself more than a secondary rank.

OLIPHANT'S LAND OF GILEAD.*

IT is strange that the broad belt of country lying between the river Jordan on the west and the Great Syrian Desert on the east should have been so much neglected by travellers. It is

* *The Land of Gilead; with Excursions in the Lebanon*. By Laurence Oliphant, Author of "Lord Elgin's Mission to China," "Piccadilly," &c. London: Blackwood & Sons. 1880.

not a dangerous or a difficult country to explore; the climate is everything that can be desired; it is full of the most remarkable ruins; it has sacred associations only surpassed by those of Western Palestine; and it is peopled with strange races. Yet the place remains a land of mystery. Few are the travellers who visit the lands of Bashan, Gilead, and Moab; fewer still who have eyes to see and ears to hear. These can, in fact, be nearly numbered on the fingers. The names of Burckhardt, Seetzen, Newbolt, Wetzstein, Porter, De Vogüé, Burton, Palmer, and Merrill almost exhaust the list—to which a tenth name, that of Oliphant, may now be added. The existing maps of this country are compiled from rough and unscientific observations made by these travellers. They are all incomplete; places are set down miles from their true position; rivers run up hills, and mountains are set upon plains. Of course, in a rough way, a good deal is known. The mountains of Gilead, as placed on the best maps, are tolerably near their true position; Wetzstein, if he did not restore to the Argob all its "sixty fenced cities," was enabled to show a region covered with villages and ruins; the Roman roads have been partly recovered, especially that which runs from Ikeria to Salchat, the last fortress on the east, and then strikes straight into the Desert—whither, no man knoweth; the Roman towns of Jerash and Amman have been repeatedly visited; many of the Greek inscriptions of the Hauran have been collected; the strange structures, with swinging doors and window-shutters of stone, in the Hauran and the Lejah, have been described; and the cities of Moab have been recovered. But hitherto travellers have been visitors rather than explorers; only two or three have remained long enough in the country to examine any part of it with an approach to thoroughness. Each successive traveller has followed a single track, the shortest from one important point to the next, leaving the country to right and left unvisited; so that any new comer in search of discoveries has only to mark out for himself a different line in order to make them. He may not light upon a Moabite stone, or recover the lost cities of the Decapolia, or find Pella and the first Christian church; but he is pretty sure of finding modern villages and ancient ruins where the maps are blanks; and, if he is an Arabic scholar, or is accompanied by a good interpreter, he will most certainly have abundant opportunity of making acquaintance with tribes whose manners and customs have never been studied, in whose minds linger strange traditions of the past, whose religion is a mystery, and whose origins are unknown.

Mr. Laurence Oliphant undertook his journey with the object of ascertaining how far, and under what conditions, the country east of the Jordan would be available for purposes of colonization, and for the furtherance of his great scheme of Jewish immigration and settlement. He left Western Palestine at Banias, where the ruins of the great Kulat-es-Subeibeh, once the stronghold of the Templars, and for a time the castle of the Old Man of the Mountain, still bar the way from Damascus. His route lay first in a south-westerly direction, through an almost unknown district, to Kuneitreh, perhaps the ancient Canatha, on the edge of the district of Jedur. Near this town are settled some three thousand Circassians. It was unfortunate that on leaving Kuneitreh, and striking across the unknown plains of Jaulan, a heavy fog allowed nothing to be seen except the luxuriant herbage in which the travellers waded knee-deep, and occasional clear, bright streams which ran across their path. Those who propose to travel on Syrian highlands hardly reckon upon such an accident as a fog. Consolation, however, for this disappointment was obtained by the ascent of a hill called the Tell el Feras, which afforded an excellent prospect of the whole country—none other than the realm of the great King Og. It is described by Mr. Oliphant as a vast expanse of well-watered plain and pasture-land, in places abundantly strewn with basaltic rocks, but capable of sustaining countless flocks and herds. Eastward and southward stretch the broad corn-growing plains of the Hauran. On the south-west of the Tell lies that rocky plain, bounded by the blue waters of the Lake of Tiberias, where Ben-hadad and his chiefs resolved to meet the Israelites. According to Moslem belief, it is on this plain that shortly before the end of all things Jesus will reappear armed with a lance for the slaying of Antichrist, after his baleful reign of forty days. There need be no mistake about the enemy of mankind, because he will have but one eye and will bear upon his forehead the name of Kalir or infidel. The district south-east of the Tell el Feras Mr. Oliphant believes to be the much-disputed Land of Uz, which is generally placed in, or north of, Arabia Deserta. Smith's Classical Atlas, indeed, with great liberality, spreads the Land of Uz over the whole of the Desert. But Arab writers have always asserted that Job lived in the Hauran; the place is full of traditions connected with Job. There is a monastery near the village of Es Sadiyah, called the Deir Eyub, or convent of Job, said to have been built in the second century by the Jeside King Amr I.—a story which, if true, gives the tradition a very respectable antiquity. A so-called tomb of Job is said to be still shown near Nawa, and another at Es Sadiyah; and the peasants call the country the Belad Eyub, or district of Job. Mr. Oliphant strengthens his case by arguing that the Uz referred to by Jeremiah (xxv. 20) must be near Damascus; that, according to Josephus, Uz settled in Trachonitis and Damascus; that the Christians in the twelfth century placed the birthplace of Baldad the Shuite twenty miles or so south of Es Sadiyah, in a district now named Zuweit, while the neighbouring village of Tema, whose inhabitants are called Temani, reminds one that Eliphaz was a Temanite. This seems, on the whole, a

pretty strong case, though experience in Biblical identification bids us warn Mr. Oliphant not to be too sanguine of the general adoption of his theory. He might, had he thought of it, have still further strengthened himself by quoting Lieutenant Conder's useful canon, that a tradition is only valuable when it is common to Jew, Christian, and Moslem. For instance, half a dozen traditions are floating about the country south of the Huleh connected with Jacob and his daughters. Yet these legends are unknown to any writer—Jew, Christian, or Arabic—and no one would, in consequence of these alone, associate the place with any event in the life of the patriarch. But in this case we have Josephus, King Amr, the Arabic historians, William of Tyre, and the modern peasants, all concurring in the same tradition, and making up between them a continuous and long catena of belief. One would, however, like to hear the other side, as represented by Smith's *Bible Dictionary*, in reply. As regards the old monastery, the most ancient ecclesiastical edifice of the kind, it is built of square blocks of dolerite, and is partly in ruins; the portion still standing is now used as a barrack, and is the residence of the mutassarif. Close to the village of Es Sadiyah are the tomb and fountain of Job, the former being a mukam or shrine, to which, as they did in the days of Chrysostom, pilgrims from all parts repair "to kiss with rapture the ground where Job suffered." The place has a special sanctity in the eyes of Africans, who come in great numbers from the Soudan, and the shrine is under the care of some two hundred negroes, who are exempt from taxation. The ruins of an ancient temple stand upon a mound near the tomb of Job, which Mr. Oliphant thinks has been successively a Phœnician temple of Baal, a Roman temple, a Christian church, and a Moslem house of prayer. If he is right, a monolith, the top of which has been broken off, was formerly the well-known emblem of Baal, and is perhaps the only monument of the kind remaining. This is no unsupported conjecture, because the place was clearly an important centre of Baal worship. The name of Astaroth, the principal female divinity of the Phœnicians, survives in the names of two adjacent villages, called Ashtereh and Tell Ashernh. Besides this was the country of the Amorites, "who served Baalim and Ashernh." The question which naturally follows is, Which of these two places, if either, is the ancient Astaroth? We cannot follow Mr. Oliphant through a very interesting argument. It is sufficient to say that he places Astaroth at Ashtereh, a village which he saw, but did not visit—it was visited by Captain Newbold in 1846—and Astaroth Karmim at Asherah, which he did visit. Thus one question opens out another, and one problem suggests another. To use Mr. Oliphant's words, the "field for antiquarian and archaeological research in these regions is so vast and enticing that, if one has any other object in view, the temptation to linger must be steadily resisted."

Leaving Tell Asherah, the traveller struck southward, and crossing the Yarmuk, passed over the Wady Rahab, which, Mr. Oliphant suggests, is the "Cavea Roob" mentioned by William of Tyre, where the Crusaders held, and lost, a strong position favourable for predatory expeditions. On their left hand lay the village of Dera, or Derat, visited by Wetzstein, who alone has seen it. He describes it as a "subterranean city." He says that he passed along a subterranean street, perfectly ventilated by holes in the roof, with cross streets leading off on either side; a "market-place with numerous shops in the walls exactly in the style of the shops now seen in the Syrian cities." In a "side-street" he found a great hall whose roof, formed of a single slab of jasper, rested on four pillars. The room had no supports, and the doors, after the fashion of the country, were of stone. He says that he was an hour and a half in the place, and that he only came out because he was afraid of the lights going out. A subterranean city! market-places and shops below the ground! It reads like an *Arabian Nights* story. The discovery is so remarkable, the account so clear, that one would not willingly throw cold water upon its credit. Yet, when one reflects that these wonders were all beheld by the dim flicker of two composite candles, it is impossible to avoid the feeling that imagination may have converted a tomb into a shop and a vault into a market-place. Is it not, however, extraordinary that such a story should have been told twenty-one years ago, and that no one has taken the trouble to follow up a discovery which, if Wetzstein's theory were true, would be as interesting as that of Pompeii? Whatever the truth may be, there can be no doubt that Wetzstein found a vast system of *souterrains* which would certainly repay examination, and it is very much to be regretted that Mr. Oliphant was denied the opportunity of making the investigation himself. He heard of two other similar places, called Beloola and Rahab, which were described to him as in no way inferior to Dera. The country is full of troglodytes, and at many villages through which Mr. Oliphant passed, as at Es Sal and Irbid, the whole population lived in grottoes, caves, tombs, or rock-out dwellings. The knowledge of their habits takes away somewhat from the "antecedent improbability" of the story. Still, it must be owned that the step from a cave to a vault, from a hillside to a burrow, is a very long one.

The route next lay through Irbid, leaving Abil—"Abila the wine bearing"—on the right, through a country crowded with rock-cut chambers, subterranean works, and ruins, few of which have ever been examined, and none planned, to Umm Keis, the ancient Gadara, at the entrance of which the old Roman road can still be traced; great sarcophagi lie about in every direction, while the ground is honeycombed with tombs. The theatre is still standing in so perfect a state of preservation that "it could be

made ready for use at the expense of a few thousand dollars." Below Gadara, in the valley of the Yarmuk, are the hot-springs of Amatha, with a ruined theatre and other remains, showing that the place was once, what it may possibly again become, a luxurious and well-frequented sanitarium. One can hardly imagine a more delightful winter residence—given, of course, a hotel and other necessities of life—than Amatha. The springs cure every ailment; the climate in winter is perfect, it is close to the Lake of Tiberias; there is fishing in the Yarmuk and the Lake; wild boars and gazelles may be hunted; Gilad is close at hand for an explorer; the cities of the Decapolis await identification; and all around is the most wonderful and beautiful scenery, especially at the "Fountain of the Brides," which is, quite clearly, a small piece cut out of Paradise and left here for the solace of Syria.

We must make short work of the rest of this delightful journey. Mr. Oliphant passed by Birket Mahneh, discovered by Canon Tristram, and identified by him with Mahanaim. It is situated on the lower spur of the mountains of Gilad, where Luban would probably overtake Jacob. Mizpeh or Galeed—could it have been a dolmen?—should be sought close by this place. It was here, as everybody knows, that Jonb fought Absalom, and in one of these glades crossed by "sparkling rivulets where the sunlight glints through the foliage of oak, terebint, and carob trees." Absalom met his end. In this beautiful country stands the modern town of Ajlun, with its great castle built by Saladin, probably with ancient materials. And near Ajlun is the Wady Yabis, a name which suggests Jabesh Gilad, one of the lost places of Eastern Palestine. Jerash, the Salt (where is the tomb of the Prophet Hosea, thirty feet long and three feet wide), El Basha, Jajuz, the Kulat Zerk, Amman, and Arak El Emir, were all visited before crossing the Jordan and returning to the better known Western Palestine.

The interest attaching to Eastern Palestine is not confined to its ruins, its topography, and its associations; the reader will find in this book a vast amount of most curious and valuable information on the strange races and religions scattered about the country. There are the Ansariyeh, a mysterious people whose secret religion is perhaps the wildest of the many wild creeds born and fostered on the soil of Syria; they were divided into five tribes, who worship respectively the moon, the stars, the air, and the dawn. All unite, however, in worshipping Ali, son of Abu Taled; they are allied to the Ismailians, or Assassins. There are next the Druses, whose tenets were completely exposed by Silvestre de Sacy forty years ago. There are the Christians, perhaps descendants of the Jafnide Arabs, builders of the Deir Eyub, who take unto themselves more than one wife, but without blame, and even with the blessing of the priest. The Christian women at Ajlun are described as being of the purest Grecian type; their eyes large and lustrous; their nose, mouth, and chin classical; their complexion a light olive. There are the Maronites, who consider themselves under the protection of France, as the Druses are the friends of the English. There are the various Arab tribes—the Beni Sukhr, or Children of the Rock; the Anazeh, who wander over an area of 40,000 square miles; the Roula, who retain the curious custom of the "war cradle," a car composed of ostrich feathers, in which lies the most beautiful of their maidens, borne before them into the fight; the Adwan, and others, all of whom seem to be coerced with ease. There are, lastly, the Circassians, who will probably play an important part in the future of the country. It is greatly to be desired that some linguist would imitate the example of Signor Lanzoni, who lived for two years in Cairo an Arab among the Arabs, it only to collect traditions and note customs which have remained unchanged since the days of Ilagar.

We have said nothing about the "practical" part of the book. Mr. Oliphant's colonization scheme. If this ambitious and attractive proposal comes to anything, books, and many books, therefore reviews, will be written upon it. We have confined our observations to the wanderings, and we have only to add that we thank Mr. Oliphant for making us acquainted with a strangely neglected country, whose charms and capabilities seem to have escaped the notice of all previous travellers. Perhaps some enterprising Company may be formed for building baths and a hotel at Amatha, in which case a winter in Gilad may prove even more attractive than a winter in Algiers; and most certainly this delightful volume, written in Mr. Oliphant's quiet, easy, and cultivated style, will stimulate others to follow in his steps. Next year we hope to read of a magnesium lamp and a measuring tape having been used with profit in Dera, Rahab, and Beloolah.

QUEEN COPHETUA.*

MR. FRANCOILLON'S powers can hardly be said to be seen at their best in his latest novel. He has before now shown both a remarkable faculty for construction (one of his shorter performances, *A Bad Bargain*, may be specially remembered as deserving in this respect to rank with the work of Gaboriau himself), and he has also shown a striking power of catching and expounding character, and of enlivening his work with humorous scenes which were not dragged in by the head and shoulders to set on a crowd of barren spectators to laugh, but which always

served their purpose in bringing out the peculiarities of the author's personages. Nothing could be better in its way than the scene in *Strange Waters* in which Mr. Francillon showed us a curate reading out *Locksley Hall* to a collection of sewing ladies, one of whom wanted to know who was "the individual Withers," while another explained with superior knowledge that the real meaning of the passage was that "the more a man shrivels up the bigger we all grow." There are signs in *Queen Cophetua* of both the talents to which we have just referred, but they are not so happily combined as we could have hoped. It is, it seems to us, partly in consequence of his becoming too much possessed with the notion of one particular and peculiar character that Mr. Francillon has been led into a novel which, in spite of its merits, is somewhat bewildering and inconsistent. The power of imagining a really new character in fiction must, no doubt, be a singularly fascinating one to its possessor as well as to those for whose benefit he exercises it; but it must also carry with it a certain danger. Such a danger the author appears to us to have run upon in his Gideon Skull, who is really the principal character in *Queen Cophetua*. Gideon Skull has about him a certain touch of "honest Iago"; but he is unlike Iago in that he takes no delight in evil for its own sake. Indeed, he has no reason in the abstract for preferring evil to good; and it is possible, as we learn early in the book, for a man to have known him intimately for a considerable time without ever suspecting that under his bluff cynical manner there lay a determination to get what he wanted and what he thought he ought to have without troubling himself about the means to be employed. Gideon Skull was thrown upon the world at an early age to "fend for himself"; and the result of his so fending was that he came back to the relations who had always regarded him as a rolling-stone of the worst kind with a convincing air of prosperity, and with certain fixed theories as to the world in which he has been rolling which are not unnatural either in themselves or in their results, but which are not explained in either case with complete adequacy by Mr. Francillon. Gideon, when first introduced to us, is described as being

big and broad, with the face of a thoroughbred Englishman; fresh-complexioned, short-featured, brown bearded, and grey-eyed. And it was better still—it was full of the sort of honesty of which we English plume ourselves on having the lion's share; a rugged, somewhat sullen sort, taking refuge in cynical speech when it is too honest to acquit itself of being touched by sentiment deeper than the outermost skin. The more prominent features were rather broad and blunt—the lion's and not the eagle's; the mouth, though rather large and heavy, was appropriate to the sort of face, and handsomely formed, at least so far as could be seen through a full brown moustache that nearly hid the upper lip and fell naturally into the full brown beard. "I mayn't be a saint; who is? But I hate humbug," the whole face seemed to say for itself; more especially the well-opened out-looking grey eyes—those features which, we are told, are alone incapable of a lie.

Later on we find that Gideon's appearance and manners are completely deceptive. Not that his honesty is entirely an assumption and part of his stock-in-trade for the deception of others. He "did not believe that men are divided into two classes, honest men and rogues, and that roguery is the best policy until it has served its turn. On the contrary, it seemed to Gideon Skull that all men were of one class, and that to talk of roguery and honesty was to make a distinction without a difference." Thus it came about that his cynicism was "by no means the commonplace and stale piece of affectation which it might be imagined." It was simply the expression of his ingrained belief that no human being allowed scruples of any kind to interfere with self-interest, and by his habit of saying openly what he thought, and what, as he was convinced, everybody else thought, he put himself in a false position. On the one hand, knaves were apt to take him for a false cynic who had really a simple and trusting heart which marked him as their obvious prey; on the other, this notion on the knaves' part frequently enabled him to turn the tables upon them; and out of the mutual misconception caused by Gideon's peculiar character came most of the strange events which occur in *Queen Cophetua*.

The passage concerning Gideon's character, of which we have just given a kind of abstract, goes on into more subtle and perhaps less fortunate reflections as to Gideon's relations with Victor Waldron, the young man as whose ally he makes his first appearance. For Victor

he would have done any quantity of the dirtiest work, and said nothing, in order that his friend might be able to shut his eyes and fancy his own hands clean. What he expected, fairly enough, to gain by his services in obtaining Copleston for Victor was no trifle to him, and he firmly believed that it was solely for his own share in the adventure that he had been working; but he would have felt it a real misfortune if Victor and not himself had been compelled, by way of last resource, to tamper with registers or do anything unbecomingly quixotic professions. . . . He had a certain sort of satisfaction in playing at honour by deputy.

The "tampering with registers," as it is here somewhat gently put, is proposed in the first volume by the man who, we learn in the third volume, had never told a direct lie. The two things are not irreconcilable; but, as we have observed, they are not fully or skilfully enough reconciled by Mr. Francillon. The Gideon Skull whom the author seems to have aimed at is depicted well and forcibly enough in the interview with his wife in the latter part of the book, when his complete conviction that he has done no wrong is finely contrasted with her naturally exaggerated view of his wrong-doing; and if the work had been throughout kept up to the level of this scene, it might have given Mr. Francillon a higher rank than he had before attained. Partly from over-elaboration,

* *Queen Cophetua*. By R. E. Francillon, Author of "Olympia," &c. 3 vols. London: Chatto & Windus. 1880.

partly from a curious want of consistency, he has failed to do full justice to his really original idea of Gideon's character, and upon the success or failure of this character the book must, from an artistic point of view, depend for its value. Gideon is the moving spirit of the novel—its *deus* or *diabolus ex machina*—and the impression produced upon us, rightly or wrongly, is that to Gideon Mr. Fraucillon has given more thought and trouble than to any other character. The girl whom he marries is, partly in the same way as Gideon, a curious experiment in character, but is a more completely unsuccessful one.

As to plot, *Queen Cophetua* is promising and disappointing, much as it is in the working out of the principal personage. There are good ideas in the construction of the story, which are insufficiently handled, and there are some which are entirely preposterous. Mrs. Reid's arrangement with Mr. Skull, Gideon's uncle, to keep her husband's will a secret for seven years, is oddly improbable, and adds unfortunate complications to a plan already involved enough. Alan Reid's resuscitation is necessary to gratify the demand for poetic justice, but is absurd enough after the circumstantial accounts of his death furnished by eye-witnesses. That he and Victor Waldron should have met at the "Bats" club and arranged to go over to the siege of Paris together under Gideon's very nose, and without his intervention, is absurdly improbable; and the manner of Gideon's death, which alone could make possible an arrangement of affairs which has to pass for being satisfactory, seems perhaps more absurdly improbable than it is. Mr. Fraucillon may very likely have chapter and verse to cite for the curious "doses of dying" which Gideon could administer to himself at will; but that is not excuse enough for bringing such an incident into a novel. "I feign probabilities, I record improbabilities," said Mr. Reade in a characteristic preface to one of his works; and the latter course is one which a novelist should be extremely chary of adopting.

Queen Cophetua cannot, as we have said, be described as a complete success; but it contains, apart from the interest attaching to Mr. Fraucillon's struggles with a difficult problem, various amusing scenes, among the best of which are those which pass in the London office of the "Spragville Aigis." Mr. Fraucillon has evidently studied closely the type of American whose ways, and even whose intonations, he reproduces. "Pahrus" is good, but surely "Amurcan" would be truer than "Amurean."

HALL'S INTERNATIONAL LAW.*

IT was time that some one should take away from England the reproach of not having yet produced a scientific and independent treatise on international law; a subject in which English citizens and statesmen are at least as deeply interested as those of any other country, and in which there are peculiar objections to receiving the doctrines of foreign writers without a certain amount of caution. This task has now been dealt with in earnest by Mr. Hall, and so well that, with his book in hand, an English lawyer need no longer be afraid to speak in the gate with any of the American or Continental authorities. In a work that covers so much debatable ground much must of necessity be exposed to criticism. In fact, a writer on international law has to be perpetually on the verge of controversy. He must embark on almost endless discussion of a mixed mass of precedents and reasons, in which the exact value of the precedents is seldom known, and the reasons are constantly biased by theoretical assumptions or political interest. No doubt there is a certain amount of settled principle, but the application of it by different States in their conduct and by different writers in their books is so various that what agreement there is appears at times to be illusory. One method much approved among writers on the law of nations is to simplify troublesome questions by assuming that rules are settled when they are not; taking care, of course, to pick out among the conflicting opinions that one which favours the writer's own sentiments, or seems to promise most advantage to his nation. Such is not Mr. Hall's way. Whatever else he does, he is always frank in facing difficulties. He treats international law as a study of real facts, not a scheme to be elaborated by deduction without regard to the actual behaviour of princes and rulers.

At the outset of his book Mr. Hall explains with laudable clearness that he intends to proceed not on transcendental but on empirical principles. His first statement, carefully framed not to prejudice controverted points of speculation, is that "International Law consists in certain rules of conduct which modern civilized States regard as being binding on them in their relations with one another with a force comparable in nature and degree to that binding the conscientious person to obey the laws of his country, and which they also regard as being enforceable by appropriate means in case of infringement." These rules "may be considered to be an imperfect attempt to give effect to an absolute right which is assumed to exist and to be capable of being discovered; or they may be looked upon simply as a reflection of the moral development and the external life of the particular nations which are governed by them." Besides these two views, there is a mixed or intermediate one to the effect that international law is founded on some kind of absolute right, but the evidence of what is right must be sought

in positive law and usage. "In the following work," adds Mr. Hall, "the second view is assumed to be correct." The reasons given for it are, in our opinion, conclusive. Their general tenor is, or ought to be, not unfamiliar to every one who has studied in the English school of jurisprudence; but we doubt if they have ever been so clearly and completely stated. They are reinforced, moreover, by an interesting Appendix "On the Formation of the Conception of International Law," which is a good concise introduction to the history of the subject. Among these preliminary topics Mr. Hall is especially instructive on the value of treaties as evidence of what the law of nations is. It is supposed by some writers that treaties form a sort of international case-law; but, as Mr. Hall truly points out, even if they profess to declare existing law, the declaration can bind only the parties who make it. A competent number of such declarations to the same effect might conceivably establish a consensus of great weight; but, again, "it cannot be admitted that the greater number of treaties do in fact express in a peculiarly solemn manner, or indeed at all, the views of the contracting parties as to what is or ought to be international law." The chief value that treaties possess is really historical, "as marking points in the movement of thought." If we find at a given time a particular new practice or modification of old practice occurring as matter of express convention in several treaties, and if afterwards these treaty stipulations "are found to become nearly universal for a while, and then to dwindle away, leaving a practice more or less confirmed," this is good evidence that something which was introduced by way of special agreement has passed into the common usage of nations, and is no longer thought to need the protection of express treaty rights. And as to usage Mr. Hall justly points out that the usage of all nations is not of equal value in all things; for instance, "it would at the present day be absurd to declare a maritime usage to be legally fixed in a sense opposed to the continued assertion of both Great Britain and the United States."

The only point on which we could wish for a fuller exposition is the nature of the sanctions, or quasi-sanctions, of international law. This law consists to a great extent, as we may see by opening Mr. Hall's book almost anywhere, of statements about what an independent nation *may* or *may not* do. What is the real meaning of this language? By writers who are content to take refuge in the principles of absolute right the question is of course neglected. To those who, like Mr. Hall, prefer to stand on the more solid, if more humble, ground of fact and experience, it should be of considerable importance. Most persons would say that the sanction by which the law of nations is enforced is war; in which may be included for this purpose isolated acts of force, reprisals, so-called pacific blockades, and the like, which are acts of war if the State against whom they are employed thinks fit to treat them as such. And the reflection is now a trite one that international law differs from laws proper in that the parties are judges in their own cause. Every Government must decide for itself whether the conduct of another independent Government is such as to make war necessary or comparatively desirable. Yet the books undertake to tell us in some detail that certain causes of war are just and certain others are unjust; not, indeed, without a quiet, but sufficiently clear, indication from Mr. Hall of the amount of wool that the utmost ingenuity and enterprise of pig-sheers may be expected to produce in this kind. How can we speak of a war as legally unjust when there is no penalty save the risks of the war itself, which may turn out, for anything that can be pronounced beforehand, to the unjust combatant's advantage? If a majority of the great Powers were ready and willing to act habitually in concert for the purpose of restraining aggressions or provocations generally deemed unjust, that would be an effective sanction indeed. But we are yet far from this state of things. Mr. Kinglake has endeavoured, at the beginning of his *History of the Crimean War*, to show that an inchoate usage in this direction exists. We should be only too glad to believe that such is the case. But the usage described by Mr. Kinglake, if it does exist, is still unrecognized and undefined. It belongs to something which is to international law what morality is to laws proper. Again, belligerents are bound to respect the rights of neutrals; and these rights may be said in a true and intelligible sense to be sanctioned by war. For a belligerent who interferes beyond measure with a neutral's rights or interests exposes himself to having two enemies to do with instead of one—a danger which not even the strongest Power will care lightly to encounter. To this it is to be added that the interest of any one neutral is, in most cases, the interest of all, so that the reinster but not insensible risk of an overwhelming coalition is present to keep the belligerents within bounds. But likewise there are laws of war conceived by publicists and statesmen to be binding on the belligerents as between themselves. Modern warfare is a state of "regulated violence," as Mr. Hall names it. And here we are not dealing with speculations in the air. There is no doubt that the violence of war has in fact been regulated and moderated to an extent that seemed impracticable in the time of Grotius. Whence comes the force of the regulation? The sanction of war is exhausted, for these rules become effective only when and so far as a state of war already exists. It may be said that the fear of retaliation or reprisals is a sanction. Where this comes into play, however, that which is for the time sanctioned is apt to be the stronger party's interpretation of the laws of war in his own favour, as was seen in the German invasion of France ten years ago. Moreover, reprisals and retaliation are

* *International Law*. By William Edward Hall, M.A., Barrister-at-Law. Oxford: Clarendon Press. 1880.

available only to a limited extent, being, according to modern notions, too odious to be carried to extremities. In fact, the greater an offence is, the less is it capable of being punished in kind. Here, then, formal and tangible sanctions desert us. The "temperaments" of modern warfare, to use Grotius's term, rest in truth on an appeal to the common morality and humanity of civilized nations, which belligerents are presumed still to share, and, in fact, still do share to a great extent, even in the midst of active hostilities. It is consonant to the feelings of civilized Governments, and in the long run to their interests, to observe towards one another in war some such rules as an enlightened neutral might wish to be observed for the sake of diminishing suffering and ill-will to the greatest extent compatible with the objects of war being attained. In other words, the sanction imposing on belligerents a certain observance of honour, humanity, and private rights, is at bottom the general opinion of civilized people. This is practically recognized by the manner in which belligerent Powers are accustomed to record their complaints of alleged infractions of the laws and usages of war. Such complaints can but seldom have the force of a specific threat; their object is to procure redress from the adversary's own sense of what is right, or, in default of this, to shame him into it by publicity. Should we not, then, regard public opinion as the final sanction of international law in every case; a sanction with physical force behind it, no doubt, in one or another shape, but a force latent and undefined, and to be called into action only in an extreme case? This would bring out more clearly than the common view does the analogy between international law as governing the relations of States and the rules of morality as governing those of individuals. Or a better parallel, perhaps, may be found in the customary rules of a patriarchal tribe, which are enforced by no specially organized authority, and in which morality and law are still undistinguished. The view here suggested is really implied in the statement made by various writers from Suarez downwards, though perhaps with full distinctness by none before Austin, that the fear of provoking general hostility—not only that of the State particularly offended—is the ultimate compulsory motive for obedience to international rules. It seems to be a further consequence that war is analogous, not to the legal remedy of suing in a court of justice, but to the "self-help," more or less regulated by custom, which has a considerable place in archaic legal systems, and of which surviving rudiments, reduced to a subordinate rank and fettered by new safeguards, may be found in the most polished ones. To pursue the comparison one step further, some guide for speculation as to the possible development and strengthening of international law may be found in the historical circumstances of partly civilized communities. Probably in early Roman history, certainly in the middle ages, and notably in the Icelandic society described in the Sagas, private war went on for a considerable time side by side with legal redress before the supremacy of the law was finally made good.

It is time to return from our digression to Mr. Hall's work. One of his greatest merits is lucid arrangement. He begins with a First Part of "General Principles," corresponding pretty much to the *Allgemeiner Theil* of systematic German writers, and giving a comprehensive view of the subject and its different branches. Then he takes up the divisions in detail. Under the head of "The law governing States in their normal relations," the rights and duties of sovereign States in time of peace are set forth. Here we have the doctrines of territorial dominion, sovereignty, the so-called "extritoriality" of public vessels, extra-territorial jurisdiction, diplomatic agents, and treaties. Extritoriality, by the way, is treated by Mr. Hall as a fiction needlessly introduced to explain anomalous immunities which are really to be accounted for on special grounds of necessity or convenience. The third part deals with "the law governing States in the relation of war," which includes, besides what are known as the laws of war, the rights of capture and levying contributions, the position of a military occupant, and the rules which determine the "enemy character" of property. The relations of neutral States to the belligerents are kept apart under the title of "the law governing States in the relation of neutrality," where, among other questions, the rules of contraband, blockade, and maritime visit and capture are discussed. Mr. Hall's division of the subject is, we believe, new, though its convenience makes it seem obvious when once exhibited. His treatment of the matter in detail is, with few if any exceptions, as good as his method. He is careful to preserve the distinction between theory and usage, and among usages to distinguish those which are established from such as are still uncertain or in process of formation; for instance, the growing practice of restraining belligerents as much as possible from bringing their prizes into neutral harbours. In two or three places which we had noted for criticism our doubt or objection has been removed by subsequent explanations or additions; and this perhaps is not a bad test of the general thoroughness of the work. The chapter on treaties might be improved by giving more attention to their operation in actually transferring dominion where the cession of territory enters into them. When such a treaty is executed the parties are bound to its results not so much by the specific obligation of the treaty itself as by the general duty of nations to respect one another's territorial sovereignty. The analogous case in municipal law is that of a conveyance, not of a pure contract. Some of the language still commonly used implies a confusion which Mr. Hall might well have given a paragraph or two to clearing away. Treaties of this kind have been distinguished by some publicists from properly contractual treaties under the unhappily chosen

name of "transitory conventions," and their effect has been still more unhappily expressed by the maxim that "transitory conventions are by the nature of the case perpetual." This is at best an extremely clumsy way of saying that the result is to create not an obligation but ownership. Proceeding from writers versed in Roman law, it is really past excuse. When a sale is complete the seller is bound to respect for an indefinite time the right of ownership acquired by the buyer, and it makes no difference if a lawsuit arises between them about some other matter; but we do not say that the contract of sale is perpetual. On the question of "pacific blockade" Mr. Hall treats the authority of modern usage (six cases within twenty years) in a rather off-hand way. We quite agree with him, however, that on principle it must be an act of war or nothing. Finally, we may point to Mr. Hall's not infrequent criticism of the Continental writers as full of excellent and profitable instruction.

TALBOT'S GREECE AND THE GREEKS.*

WE trust that "The Right Honourable W. E. Gladstone, Premier of England; author of 'Homer' (a work of rare merit)," &c. &c., to whom "this work is inscribed with profound sentiments of esteem and admiration by the author," is satisfied with the list of his manifold accomplishments set forth in the dedication. In his political career Mr. Gladstone has brought upon himself many well-meant, though embarrassing, tributes from his admirers; but as a scholar he has, so far as we know, done nothing to deserve that this tedious volume of incoherent and inaccurate remarks upon Greek manners and customs should be laid at his feet. Anything less scholarly than the present work it would be difficult to conceive. Mr. Talbot's short but numerous chapters read like the essays of a dull boy, with a bad memory and the haziest notions of English composition, who has spent a month or so in trying, without any previous knowledge, to learn by heart the *Smaller Dictionary of Antiquities* edited by Dr. Smith, and has reproduced the learning thus acquired after the fashion which might be expected in such circumstances. The various branches of his subject are treated by the author in no particular order, and on no particular plan. His astonishing and comprehensive ignorance of details is well matched by the fatuous character of his deductions, comparisons, and generalizations; while his constant blunders in the Greek and Latin languages are thoroughly consistent with his frequent inability to express himself in his own.

This may seem to be a somewhat sweeping condemnation; but a slight examination of the book will make its justice sufficiently apparent. Mr. Talbot begins his account of Athens by giving a list of the various names by which Attica was known at different periods of her history. He informs us that the country was called "Posodonia from Neptune, and Minerva from Pallas; these being names appropriated to these imaginary deities respectively." We do not suppose that Mr. Talbot really means to tell us that Minerva was a name of Attica, but prefer to regard that part of the statement as an example of his very common habit of saying exactly the opposite of what he wishes to say. It may here be mentioned that among Mr. Talbot's delusions is the belief that the Greeks worshipped the gods of Rome. He gives a list of those gods—Saturn, Jupiter, Juno, and so on—and tells us that "Jupiter was the one who was regarded with the highest degree of reverence by the Athenians." He is apparently unacquainted with Pallas Athene, the eponymous deity of the city. On the topography of Athens Mr. Talbot is particularly amusing. The position of Greece is "somewhat central" with regard to the Old World. "In the midst of Greece stands Attica, nearly the centre of which is occupied by Athens." We have hitherto been under the impression that Athens was only four miles from the coast; but Mr. Talbot is evidently of a different opinion. In the centre of Athens, again, stood the Acropolis, a "tower or citadel." Upon the top of this tower stood crescents or semi-lunar representations, richly-gilt, according to the custom of the Ishmaelites, who paid especial reverence to the moon." What the Ishmaelites have to do with Athens, and how far gilding may be taken as a work of especial reverence, seem as difficult to discover as the authority from which this description is derived. Athens was connected with Piræus—which Mr. Talbot always writes Pyreus—by walls. "In those walls there were, of course, several gates," one of which, the Acharnian, "is supposed to have been so called from the town of Acharna (*sic*), towards which it looked. For it may be observed," adds Mr. Talbot, with much acuteness, "that the ancients named their gates from the towns or remarkable places near or opposite to them." We can assure Mr. Talbot that a similar curious custom obtains among moderns. The Edgware Road is so called because it leads to Edgware, and Charing Cross Station derives its name from its proximity to Charing Cross.

We may now leave the town of Athens and pass on to its inhabitants, who seem to have been rather curious people. They were "divided into two classes, a distinction based, not upon property or calling, but upon character and morals. They were thus called *Athenaiot* and *Attikoi*, the former being a designation of

* *Greece and the Greeks; or, a Historic Sketch of Attic Life and Manners.* By the Hon. Thomas Talbot. London: Sampson Low & Co. 1880.

honour, and the latter of opprobrium." Mr. Talbot, ever ingenious and happy in his conjectures, takes it "that this distinction was somewhat analogous to that which we of the present day make between the virtuous and the immoral, the honest and the knavish, in short"—according to Mr. Micawber's formula—"between good and bad citizens." We further learn that the *Attikoi* were themselves divided into three classes—the babblers, the *ὑπολοί*, or deceitful persons, and the *Sukophantodeis* (why not *συκοφάνταις*, or Sukophanteis, if Mr. Talbot wishes to write this particular word in English characters?) At this point a painful idea will strike the reader that perhaps, if Mr. Talbot had lived in the society which he thus strangely describes, some unappreciative official might have classed him among those who were *περιεργοὶ τὰς λαλαίς*, superfluous babblers. In treating of "other divisions of the Athenians into classes," Mr. Talbot mentions the "*geomoroi*, or landed proprietors; who were somewhat analogous to what are called yeomen in England; but they were the proprietors of the soil which they cultivated." Yeomen, then, do not own the soil which they cultivate. Mr. Talbot completes his account of this classification by calling the handicraftsmen *Demigourai*. Passing on to Solon's classification, we may mention that the *Pentakosiomedimnoi* were not "those who were the possessors of 500 measures of dry, and the same of wet goods," but those whose landed property yielded an annual income of 500 measures in all. Members of the second class were entitled *Hippiis*, not *Equites*, and of the third *Zeugetai*, not *Zeugetes*.

We have by no means exhausted the stock of blunders occurring in these few pages, but it is time to pass on to other parts of the book. Perhaps the most astonishing mistakes in the whole book occur in the chapters on the Law Courts. Mr. Talbot begins by saying that the judges were selected from the Council of Six Hundred, but that those only were eligible who were over sixty years of age. Five, he says, were selected from each tribe, making fifty in all. Of what he was thinking when he wrote this it is difficult to conceive; but surely even Mr. Talbot cannot really require to be told that all free citizens of Athens above thirty years of age were eligible as judges, and that of these 600 from each tribe, 6,000 in all, were annually chosen by lot for the service of the year. The method of procedure in the law courts, as explained by Mr. Talbot, was very curious:—

The complainant put three questions to the accused: first, as to whether he was guilty or not guilty? Second (supposing the answer to the first question to be in the negative), for what reason he had committed the crime? and, third, who were his accomplices?

How the second and third questions could be asked if the first were answered in the negative is not very clear, nor is the following statement:—

In trials for capital offences two sentences or judgments were delivered: first as to the guilt or innocence of the party; and second, in the case of guilt, as to the punishment to be awarded. But if the first sentence happened to be one of acquittal, the party acquitted was permitted to fine himself; which, if not done adequately, or to the satisfaction of the Court, the judges themselves made an addition to the penalty.

In criticizing any of Mr. Talbot's statements, the first, and often the most difficult, task to be accomplished is to find out what he means. In the present case this is simple enough. We have only to write "conviction" and "convicted" for "acquittal" and "acquitted" in the passage just quoted, and we arrive at what may be charitably presumed to be his meaning. Mr. Talbot is quite ignorant of the distinction between *τιμωροὶ* and *ἀτιμωροὶ* *δυνάτες*—cases in which the penalty was to be assessed by the judges, and those in which it was fixed by law. In those cases in which the penalty was to be assessed, the plaintiff mentioned the punishment which he considered just, and the defendant, if found guilty, made another assessment. The judges adopted whichever of the two seemed to them to meet the justice of the case. They had not the power to fix a penalty intermediate between the two assessments, as Mr. Talbot seems to suppose. It was this inability on their part which in all probability led to the execution of Socrates. He was found guilty by the rather small majority of 60 votes (not 280, as Mr. Talbot absurdly states, which would be the total number of those who voted against him). His opponent had named death as the fit punishment for his offence, and Socrates could not be induced to suggest any alternative penalty beyond an insignificant fine. The consequence was that the judges, irritated by what they held to be mere levity, passed the sentence of death by a majority larger than that which had convicted him. It may perhaps seem superfluous to state facts so well known as these, but no fact is too notorious, no knowledge too elementary, for this author to blunder over.

We may now turn to Mr. Talbot's efforts in the department of etymology. Here he fluctuates between the wildest flights of imagination and the most timid suggestions of obvious facts. He derives *ἄσπας* from *τὸ θείον*, on the ground that the breastplate was used to protect the divine part, or heart. The *ἑρμῆες*, or heralds, "derived their name from *ἁερῆστος*, which signifies better, because they selected the more tender or better part of the victim for their own use." In the exclamation *Io Pean*, *Io* "is an abbreviation, by the Greeks, of the word *Jehova*; and *Pean* is derived from the Hebrew word *Peneh*, which signifies to look, so that the words *Io Pean* signify *Lord look* (upon us)." Mr. Talbot here mentions "a curious and remarkable circumstance, that there was a certain tribe or people of the West Indies who, according to the account of Sir Francis Drake, used when fighting to dance, leap, and sing *Ye Toa*." It is an equally curious and remarkable circumstance that Mr. Talbot does not absolutely insist upon any connexion between

the Greeks and West Indians on the ground of this remarkable coincidence. He firmly believes in some very close relationship between Greece and Ireland, because in both countries the inhabitants attached importance to dreams, and occasionally carried water on their heads. After such bold derivations as these, given apparently without the slightest doubt of their absolute certainty, it is a little disappointing to find Mr. Talbot suggesting, with the utmost timidity, that possibly our word parasite may come from the Greek *παράσιτος*. One more exquisite derivation must be mentioned—that of the Latin word *ara*, altar, from *aro*, to plough, "because it was ploughed or scooped out in the earth." Of course the word really means, on the contrary, something elevated, and its older form was *asa*, which is connected with the Sanscrit *ās* and the Latin *sedere*. In translation Mr. Talbot is equally happy. He renders *ἐπαίος γάμος* by "the beautiful bride," instead of "seasonable marriage." *Τυφλὲ Πλούτρε* he translates "O blind Pluto," and is apparently under the impression that Pluto was the Greek God of Wealth. He incidentally quotes the exclamation of Iulus in the *Æneid*, "*Mensus etiam consumimus*," and translates it "We have consumed the meal," in equal ignorance of the ordinary meaning of the word *mensus*, the tense of the verb *consumimus*, and the whole story of the prophecy and its fulfilment. In the matter of misquotation the printer is always a convenient scapegoat; but, where mistakes of all kinds abound, some share of the blame may fairly be laid upon the author; and Mr. Talbot cannot quote a line of Ovid without making two hideous grammatical mistakes:—

Ossa tamen facito parvo (sic) referuntur (sic) in urna.

It is no exaggeration to say that Greek and Latin names and words generally are oftener spelt incorrectly than correctly. Delphi is invariably written Delphos, possibly from some confusion in Mr. Talbot's mind of Delphi with Delos. The *Πεδεῖς* and *Ἀργαδεῖς* are called respectively *Pedici* and *Ergades*; for *φρύγερρον* we find *phrogeteon*, for *θηρηκία*, *θηρηκία*, while *ἀναδημῶνα δαίτης* is written *ἀναδημῶνα δαίτης*. Among blunders of various kinds may be mentioned the attribution of the tragedy of *Medea* to Aristophanes; the statement that Pericles originated the custom of pronouncing funeral orations; and the constant assumption that the Greeks were in the habit of talking Latin. Thus we are told that when a host received his guest they "pledged their faith to each other, and 'confirmandum quod unus non deciperet alium,'" which is not merely Latin, but very bad Latin to boot. *Non lucet* is given, instead of *non liquet*, as the Latin equivalent of the Scotch verdict *not proven*. In the use and invention of English words Mr. Talbot is not always fortunate. He talks of "tri-monthly meetings" when he means three meetings in a month; and, by a delightful mingling of sanitary with romantic subjects, calls love charms *philtrations*.

But we have not space to follow Mr. Talbot any further in his incoherent ramblings. Nothing but rather lengthy quotations could give any idea of the peculiar characteristics of his style, and the astonishing imbecility of his arguments. If he wishes to realize the enormity of what we believe to be his first literary offence, he may do so by comparing his present work with Mr. Mahaffy's delightful sketch of *Social Life in Greece*.

TWO FOREIGN NOVELS.*

THE taste for foreign novels is by no means so decided with us as it is with some of our Continental neighbours. In Russia and Scandinavia the appetite for English and French romance grows with what it feeds on, and it is no exaggeration to say that a voracious reader in the North of Europe is only six months or so behind a Londoner or a Parisian in his knowledge of ephemeral fiction. But the practice of publishing novels in the *feuilletons* of newspapers, a practice which brings certain chapters of romance under the public notice every day, has never found favour in England, and we show very little inclination to avail ourselves of the laxities of copyright law. There is, moreover, a widely spread impression that England is the home of the novel, and that we possess in our own language the best fiction in the world. As far as current fiction goes, the boast has long since become an empty one. With all the faults of the French novelists, fruits which belong to a social condition other than our own, and which banish from general study some of the masterpieces of literature, it cannot be denied that they understand the art of constructing a story, and particularly a short story, far better than we do. The fourth-rate French novel, a book without any real insight, originality, or charm, has nevertheless a superficial gift of style, an external semblance of good workmanship, which gives it a great advantage over the productions of our own lesser writers. The Russians, moreover, in the persons of Tourgenief and Tolstoy possess two novelists whom insular vanity alone can pronounce to be below the highest English standard. If, however, we pass from Russia and France, it must be confessed that there is a good deal of truth in the supposition that it is not necessary for English novel-readers to cross the Channel. Germany has produced many writers of romance in the present generation, and certain instructed tastes are gratified, each in its own order, by the idiosyncrasies of Auerbach, and Paul Heyse, and Sacher-Masoch.

* *Quisiana*. From the German of Friedrich Spielhagen. By H. E. Goldschmidt. Nimmo & Bain.

The Count of Talavera. From the Dutch of J. van Lennep. By A. Arnold. Nimmo & Bain.

Each of these novelists has an extraordinary personality, a strong flavour of the soil; it may even be questioned whether curiosity and the love of a new sensation have not as much to do with their success as their own un doubted merits. In Norwegian literature a native genius kindred to that of Auerbach, but enshrined in a finer style, has given a European reputation to the name of Björnson. In Holland the Batavian humour has found excellent expression in Beets and in Mme. Bosboom-Toussaint. But these swallows are very far from making a Teutonic summer.

In *Quisiana* we have a good example of the second-rate German novel of our own day. The talent of Spielhagen, a talent which depends for its effects upon a startling combination of satire with pathos, has been greatly exaggerated. His habit of wandering away from the plot, of introducing long episodes, of staggering, as it were, under the load of his own creation, leads to results of which a German audience is less impatient than an English one, but which betray a laborious and unskilful hand. Those who admire Spielhagen most, however, admit that in *Quisiana* he has escaped, more than in any other novel, the peculiar pitfalls of his style; and it is therefore a particularly favourable sample of his work. It is too clever to be exactly tedious, and yet we feel throughout that the plot wants life; it would move and sparkle in the hands of a born story-teller, it hangs lifeless in those of Spielhagen. Yet, as we have said, the book is too clever, it presents too much intellectual ability, to be unreadable. The problem on which the story turns is one which is never raised in English society. Bertram, the hero, is in love with his niece Erna; and the main thread of the story hangs on his doubt whether or not he ought to yield to her indubitable preference for him and marry her. "It is true that, by an awkward transition in the story, the heroine transfers her affections, without warning, to an agreeable young gentleman of her own age; but the stern ethical conscience of the reader is no more pacified than it is by the accident that always restores the wife intact to the arms of her spouse in the fifth act of an Elizabethan comedy.

The scene of *Quisiana* is to some degree an entertaining one. Of the little wayside inn which gives its name to the book, "a fair white hostelry, embowered in roses," among the orange-groves of Capri, we hear very little indeed. The principal part of the story is carried on at a German village, called Rinstedt, within the jurisdiction of one of the Thuringian Grand-duchies, the Court of which throws a certain halo over the society. Bertram, a rich old bachelor, over whose early love affairs a curtain has been drawn, only to be constantly plucked aside by affectionate curiosity, is staying during a slow convalescence with his sister, Frau Berner, who is the wife of the wealthy potentate of the district. The only law that Bertram has laid upon his family is that he should never be brought face to face with his cousin Fräulein Lydia von Aschhof, the cause of that mysterious curtain of which we have spoken. Lydia is voluble enough in giving her account of the situation; she was cruelly jilted by Bertram twenty years ago; but the family impression is that it was really she who, in a caprice of unsuccessful ambition, threw him off, and was never able to get hold of him again. Lydia has made Frau Berner her confidante, and, taking advantage of Bertram's feeble state, has contrived to be invited to the house during his visit. Bertram, finding accidentally that his direct request has been disregarded for the first time since the original jilting, determines, ill as he is, to leave the house before Lydia arrives, and the first chapters are occupied with his amusing and yet almost tragical adventures in so doing. His niece Erna it is who brings him back, and who persuades him to receive Fräulein Lydia with fortitude. As he stands alone in the reception-room, Lydia, who is a consummate actress, darts in at the window and throws herself at his feet. The only result is that the poor old bachelor has an attack of palpitation of the heart, and the artful Lydia has to retire crest-fallen. She has indeed become a dreadful object, with rouge on her cheeks, a shrill, rattling laugh, false teeth, and a distressing expanse of throat and shoulder. This noisy coquette simply disgusts him, and she soon sees that she has no chance of recovering his affections. From this moment war is secretly declared between Lydia and Erna. The jealousy of the old maid gives her an unwonted perspicacity, and she perceives the growing tension of manner which is the only outward sign of the mutual affection of uncle and niece. Determined to secure Bertram in spite of himself, she persuades Frau Berner to make a match between Erna and the Baron von Lotter-Vippach, a young man of doubtful antecedents, who is supposed to have great influence at the Grand Ducal Court, and to secure Bertram by making him at once a cat's-paw and a confidant. With rueful feelings the old uncle receives his sister's confidences, and promises to discover whether Erna is or is not in love with the Baron, for more than this he refuses to do. At this point the plot becomes beautifully tangled. Herr Berner proves to be secretly bankrupt; Erna leaves a letter lying about in which she confesses her love for Bertram; this letter falls into the nimble fingers of Lydia, whom it drives to desperation; and, in the midst of all this stress of intrigue, there arrives a Princess Alexandra Volinzov, a *deus ex machina* introduced for the purpose of exposing the too-brilliant Baron von Lotter-Vippach. The story proceeds in this dazzling way, providing innumerable surprises, which are not quite ingenious enough to take away the breath of any experienced reader, and we reach the close of the book with the feeling that we have been observing the habits of a group of thoroughly disagreeable people, not one of whom, not even the heroine, constrains our respect or liking. The drama has been

very brisk and very bustling, but it was not like real life, even real stage-life, and we see the clever marionettes put away into their box without the least regret. We cannot but think that imaginative literature must have reached a low ebb in Germany when a story like *Quisiana* can be quoted as the best book of one of the leading writers of the day.

The other volume on our list is translated from the Dutch of J. van Lennep, and under the new name of *The Count of Talavera* conceals an old friend, *Ferdinand Huyck*, which, unless we are very much mistaken, has already been presented to the English public more than once. Van Lennep belongs to a bygone generation, while Spielhagen represents the movement and fashion of our own age. But, notwithstanding this advantage, we still greatly prefer the work of the Dutch novelist. The influence of Sir Walter Scott, exercised as it was in almost all countries of Europe, found its principal Dutch exponent in a writer whose industry and multifarious accomplishments were almost worthy of the name of his master. Van Lennep would hold, in a comparative criticism of European romance, a place about midway between Alexandre Dumas père and the late Lord Lytton. He is like them both in the harlequin swiftness and variety of his intrigue; he has more of the manliness of Dumas than of the false "goodness" of Lytton, but he approaches the latter in his tendency to abstract digression. All three have the same fondness for mysterious concealments, Quixotic gallantries, and the pomp of more or less fictitious antiquarianism. When Dumas once intruded on the very field of Van Lennep in writing *La Tulipe Noire*, he showed himself by far the greater master of the two; but Van Lennep is by no means contemptible in his powers of riveting and delighting a romantic fancy. *Ferdinand Huyck*, or, as Mr. A. Arnold, who has very creditably translated it, prefers to call it, *The Count of Talavera*, begins with great art. The hero, a stalwart and chivalric but too-confiding youth, who has just returned from the grand tour to his native Holland, suddenly finds himself challenged to fight, at a village hostel, by a mysterious bandit, and is rescued by a still more mysterious pedlar, but not until he himself has accidentally saved the life of a tall dark stranger, wrapped in a blood-red mantle. All this happens in the first ten pages, being told in a manner that has nothing melodramatic in it, and being set in a very curious picture of Dutch rural life in the beginning of the eighteenth century. Of course the bandit and the pedlar and the blood-red stranger are all persons of infinitely dark and cryptic purposes, and all of them inextricably involved in the fortunes of the confiding hero. A page or two further on we are introduced to the heroine in high life, to the bad hero, and to the heroine in low life, all in clever and original scenes, whose only fault is that they traverse the stage with a too bewildering rapidity. Almost any ten pages of *The Count of Talavera* supply as much plot as the whole of a novel by one of our clever analytical novelists, let us say Mr. Henry James. We walk, in fact, in an atmosphere of romance, and we cannot retire to our chamber to read a chapter in quietude, but we are sure within half-an-hour to witness the escape of a political prisoner down the study chimney. This sort of thing, of course, may easily be overdone, and was utterly overdone by the ordinary writers of the last generation; but it must be confessed that this brisk manner of invention is very engaging in the hands of a master like Van Lennep or Dumas.

SIBERIA IN EUROPE.*

EVEN if the text of Mr. Seebohm's interesting volume had been as forbidding as the bleak Siberian tundras where he went on his fowling and bird-nesting expeditions, the illustrations must still have sufficed to recommend it. A more delightful series of wood-engravings we seldom remember to have seen than those that form the headings to the different chapters. For the most part, too, those engravings are the keys to his subjects, and they are infinitely more suggestive than the far-fetched extracts from poems or plays which are pressed into doing similar duty in novels. Wherever we may open the pages, we can hardly go far wrong, although of course we have found our special favourites. For example, there is "The Lighthouse at Heligoland on a Migration Night," where the light-beams are streaming out upon the blackness of the night, and on myriads of birds attracted to the glare, like mosquitoes swarming round a lantern on one of the rivers of Siberia. Then there is another picture of "the flooded banks" of one of those Siberian rivers, where the melted snows have been overflowing the landscape and turning the bluffs on the densely wooded banks into islands. Again, there are "the banks of the Zylma," with the aquatic fowl clustering almost as thickly as the nocturnal migrants round the Heligoland lights; while for sport we have "shooting wild geese" from an ambush on the banks of a stream, in what looks like the breaking dawn, or possibly the fading twilight. Perhaps even more fascinating to many people will be the little "bits" of still animal life—the willow grouse roosting *en famille* on the boughs, or the nests of the grey plover and the little stint with the eggs and the young. We repeat that one may get an excellent idea of the contents of the volume by the mere study of drawings which are photographic in their

* *Siberia in Europe: a Visit to the Valley of the Petchora, in North-East Russia; with Descriptions of the Natural History, Migration of Birds, &c.* by Henry Seebohm. London: John Murray. 1880.

realism, and which will bear examining again and again. But the book itself is most interesting reading, though naturally there are parts of it which chiefly recommend themselves to the practical ornithologist. Mr. Seebohm, with his companion, Mr. Harvie-Brown, went through a variety of adventures in the pursuit of ornithological science, and had to endure a succession of hardships which nothing but enthusiasm could have sweetened to them. Neither of the gentlemen was altogether inexperienced in Northern travel. Mr. Harvie-Brown, on a former excursion, had pushed his researches as far as Archangel; and Mr. Seebohm himself, in his quality of naturalist, had paid a summer visit to Northern Scandinavia. A comparison of the results of their respective observations had led to the conclusion that "another ten degrees east would bring us to the breeding-grounds of many species new to North Europe"; and, moreover, there were sundry questions whose solution has for many years been the ambition of field-naturalists. The breeding-places of certain of our familiar British visitors were still undiscovered, notably of the grey plover, the little stint, the sanderling, the curlew, the sandpiper, the knot, and Bewick's swan. Messrs. Seebohm and Brown decided accordingly upon a visit to the Petchora river, which at that time they believed to be virgin ground ornithologically, and which proved really to be so, as far as published reports were concerned. As may be presumed, the Petchora, which runs its course through European Siberia, is sufficiently inaccessible. Where there are no roads, and where there is next to no traffic, a score or two of leagues more or less is of little consequence in a calculation; and the distance of the river from Archangel eastwards is estimated roughly at from 700 to 800 miles. They travelled, of course, in sledges, as they had previously done from the railway station of Wlogda north-eastwards to Archangel, and they started about the second week in April. They had little time to spare, as a fortnight later the rising temperature made the snow impassable, when "for two months the valley of the Petchora was as effectually cut off from all communication with civilized Europe as if it had been in the moon." As it was, the journey was infinitely more tedious than it need have been had they set out a week or two earlier. The horses and the runners of the sledges sank deeply in the softening snow; and where the snow was caking again with the frost, the projecting spars acted as drags, when they buried themselves in the hardening banks. The forest scenery was picturesque, but the birds they had come in search of were scarce. These were principally hooded crows, ravens, jackdaws, and magpies, with a few sparrows, and an occasional flock of snow buntings. And, as may be supposed, the travellers were glad enough to arrive at their destination in the little town of Ust-Zylma, situated at the junction of the Zylma with the Petchora.

More uninviting quarters for a protracted sojourn than Ust-Zylma can hardly be conceived, in the prospect of the coming thaw and the consequent floods. The streets and the enclosures round the houses were buried deeply in frozen liquid manure, in quantities sufficient to breed a pestilence. Thanks, however, to the beneficent arrangements of nature, the greater part of that congelated filth would be washed away with the rush of the spring freshets. Lodgings were cheap, for the travellers had two excellent rooms in the best of the houses at two roubles a month; and, thanks to their good letters of introduction, officials and residents were friendly and hospitable. No doubt it was a drawback to social enjoyment that hosts and guests had no common medium of communication, since the former spoke no language but their native Russian; while the Polish gentleman whom Mr. Seebohm and his companion had engaged, among his other capacities, as their interpreter, recklessly paraphrased the Russian sentences in translation, rendering them, moreover, in most execrable French. Fortunately, they made friends with the German captain of a steamer belonging to a timber company and plying in the Petchora, and on board his boat they made sundry trips to bird-hunting districts which might otherwise have been inaccessible.

The first excursions were unsatisfactory. Resident birds were almost as scarce in the neighbourhood of the village as they had been in the pine forests; and the migrants had not begun to arrive. Neither had the summer made its appearance, somewhat to their surprise after the heightened temperature which had delayed them on their journey. Accordingly, pending more serious business, they laid themselves out for information as to the Samoyedes, who occupied some encampments in the environs of the town, and of whose habits we have a curious and interesting account. At last the summer burst upon them at the beginning of May, and one morning they witnessed a most impressive spectacle. Seeing general excitement in the village, they hurried to the doors, when they saw "their road in movement," and going at the rate of two or three miles an hour. The stream of the Ust-Zylma, along which they had been sledging so lately, had broken up for the season. Consequently in their boating expeditions down the Petchora they had to contend with the floods which swamped the country far and near, turning the hilly shores into archipelagoes of wooded islands. Once or twice they had narrow escapes when they had to drag their boat across the stretches of breaking ice previously to launching it upon the opposite side. Mr. Seebohm describes the woodland scenery as appearing the more beautiful to them in contrast with the barren desolation of the tundras:—

Under foot spread a carpet of soft green moss and lichens, the thick moss predominating in the older and thicker part of the forest, while the reindeer moss and the many-coloured lichens abounded in the younger and

more open woods. Stray shrubs of arbutus and rhododendron, bushes of bilberry, crowberry, cranberry, the fruit of which was preserved by seven months' frost, clumps of carices and other vegetation decked the shady aisles. The monotony of the great pine forest was varied by the delicate hues of willow and alder thickets, by plantations of young pines and firs, by clumps of tall spruces and haggard old larches, while here and there a fine birch spread abroad its glossy foliage, or a gaunt Scotch fir extended wide its copper-coloured arms.

Meanwhile, in these woods, although chiefly in the *tundra*, and on the islands and sandbanks in the delta of the great river, they had been adding steadily to their various collections. They had secured specimens of several new species, and they had tempted the peasants to gather eggs for them with some success. It was the *tundra*, however, that was their surest resource. The *tundra* is generally a broad rolling moor, covered with mosses, lichens, or dwarf shrubbery; broken here and there by great patches of bog, and dotted over everywhere with sheets of water. The birds whose eggs they were seeking built chiefly in the rough patches of tussocky grass. The story of the incidents of one memorable day may be taken as a sample of the rest. The eggs of the grey plover, it will be remembered, had been one of the main objects of the journey to the Petchora. Hitherto they had not even set eyes on the bird itself; nor had they seen any specimens among the flocks of emigrants that had passed down the Petchora while they were stationed at Ust-Zylma. This morning they had at length flushed the birds upon the *tundra*; and they resolved to make diligent search for nests. An offer of half a rouble for a discovery failed, with a single exception, to awaken the zeal of their followers. The men, who were somewhat indolent, had no mind to attempt what they fancied to be impossible. But there was one honest Samoyede who "tramped the ground systematically, and after more than an hour's search found a nest on one of the dry tussocky ridges intersecting the bog, containing four eggs about the size and shape of those of the golden plover, but more like those of the lapwing in colour. The nest was a hollow, evidently scratched, perfectly round, somewhat deep, and containing a handful of broken, slender twigs and reindeer moss." To place the relation of eggs and nest to this comparatively rare species of plover beyond any possibility of question, they watched for the unlucky mother and bagged her. When a man sledges for a thousand miles or two in the pursuit of science, he is but too apt to discard scruples of humanity when he sets himself to illustrating a fact or demonstrating a disputed proposition; but we must say that Mr. Seebohm and his friend showed themselves more remorseless than the keenest of ordinary sportsmen. His remarks on touching evidences of self-sacrificing maternal instinct, or on pretty examples of innocent confidence, have invariably the same disagreeable dénouement. Or, if the victim does escape, it is simply because Mr. Seebohm does not seem to have been by any means a deadly shot. Of course they often slept roughly and fared meagrely, but the greatest torment of their lives was the mosquitoes. These venomous pests swarmed everywhere, hung over the bird-hunters in their ambushes in clouds that might be felt, and forced their way through all artificial defences. "We were told that this plague of mosquitoes was nothing as yet to what it would become later. 'Wait a while,' said one Job's comforter, 'and you will not be able to see each other at twenty paces' distance; you will not be able to aim with your gun, for the moment you raise your barrel half-a-dozen regiments of mosquitoes will rise between you and the sight.'" On the whole, however, they were highly gratified with the results of the journey. They brought home the eggs of three of the kinds of birds whose breeding-places had hitherto escaped discovery—namely, those of the grey plover, the little stint, and Bewick's swan. They "added several birds to the European list which had either never been found in Europe before or only doubtfully so"; they made many observations of great importance and interest; and they had collected besides more than a thousand skins, with no less than six hundred eggs.

FRENCH LITERATURE.

THE third volume of M. Duruy's Roman History (1) in its new and gorgeous edition continues to show what lavish abundance of illustration of the best kind is at the disposal of French authors for their books. The history itself is a sufficiently sober narrative, strongly tinged, of course, with Imperialism; but it must not be taken as a bad compliment to M. Duruy if we say that these huge volumes, which Atlas himself would hardly care to hold up for an hour or so by the fireside, seem rather intended to be turned over for the sake of the engravings than seriously read for the sake of the text. In the present volume, which includes the history of Caesar's Gallic campaigns, M. Duruy has had a double incitement to be lavish of "figures," first, because of the interest of the subject to Frenchmen, and, secondly, because of the labour spent on it by his late master. The sites of the battles and sieges, the relics of ancient Gallic art, even the dolmens and the menhirs which may or may not date from the period, are carefully delineated, and not the least interesting plate in the book is one showing the limits of the distribution of rude stone monuments in France. The plans of towns and fortifications are perhaps as good as anything of the kind that has ever

(1) *Histoire des Romains*. Par Victor Duruy. Nouvelle édition. Tome III. Paris: Hachette.

been inserted in any book intended for the general reader. For the chromolithographs, gorgeous as they are, we confess that we care less, inasmuch as they always seem somewhat to "sweat" at the unadorned black and white of the letterpress that accompanies them. Illuminated manuscripts should not be imitated timidly. If colour is used in the ornaments, it should be used throughout. However, some of these very chromolithographs are as good specimens of their rather dubious kind as we have seen, and occasionally, as in the representation of a mosaic pavement, for instance, may be allowed to interpret the subject better than mere black and white could by any possibility have done; but then, perhaps, a mosaic pavement is not an ideally suitable illustration for a sober history.

M. Granier de Cassagnac goes with M. Duruy naturally enough. This second series follows up the first of its author's *Souvenirs du Second Empire* (2) in giving an artfully cool and unimpassioned, though a most decidedly Bonapartist, view of the subject. The strength of the position lies in the argument from the *plébiscite*, an argument which no pure democrat has ever been able to get over, and which therefore has had to be met with personal bluster and exaggeration of the *crime du deux Décembre*. Of course those persons who have no admiration for plébiscites are under no obligation whatever to accept or to admire the Second Empire; but then M. Granier de Cassagnac's main adversaries are not in this position. With remarkable skill, and without a grain of the malice which it must have been hard for a Frenchman to keep out of such a matter, but which would have injured the seriousness of his demonstration, M. Granier de Cassagnac extracts from M. Victor Hugo and other opponents confessions of the almost universal acquiescence in the *Coup d'état*. We cannot follow the author through the whole of his ingenious *plaidoyer*, in which he certainly succeeds in upsetting a good many of the Republican martyr-legends. Unluckily for him, he does not always completely guard his own legs from the arrows. We are presented to the Emperor Nicholas, and enjoy the account of his interview with a certain "voyageur français." The Emperor, it seems, expressed himself warmly about Prince Louis Napoleon, but was a little disturbed at the seizure of the Orleans domains. Thereupon the "voyageur" suggested that the object of the annexation was "pour alléger le sort des ouvriers." This explanation of the phenomenon, which the late Professor Mansel described as

France's half-fledged eaglet gazing with undazzled eye
At the subbeams of his glory and the Orleans property,

strikes us as rather more ingenious than satisfactory.

Biographies of the anecdotic kind are not so common as they once were, having been to a great extent replaced by an uncomfortable and inartistic hotch-potch of letters and scraps of connecting narrative. Mme. de Janzé's *souvenirs intimes* (3) concerning Berryer are almost entirely of the old kind, and are interesting enough, though perhaps they have no great literary merit, and though the lady's adoring Royalism must occasionally move a smile, even in the case of the most sympathetic reader who knows his subject. Her account of Louis XVIII. describes him as a kind of belated Marcellus, given to France by the Almighty too late and snatched away too early, which, indeed, was Berryer's own opinion—at least he said so. However, it is quite delightful to read utterances of such a certain sound as Mme. de Janzé's. The Restoration, she says, "had given Algiers to France (en dépôt de l'Angleterre), had freed Greece, had replaced Ferdinand on the throne of Spain [these two acts, we presume, were a kind of compensation each for the other], had re-established the financial situation of France, and had placed her in the first rank of the European concert." This is certainly thorough. However, Mme. de Janzé's outspoken politics are only the framework for a vast number of anecdotes about all sorts of interesting people, and not merely about Berryer himself. A good many of these, of course, are not new; but they are derived from an infinity of different sources, and it must be a very well read person indeed who, even putting aside Mme. de Janzé's personal contributions, knows them all, or even a great part of them. The book is one of the pleasantest companions for a spare half-hour that we have come across for some time. From Mme. la duchesse de Berry, a heroine over whose somewhat unlucky heroism Mme. de Janzé is enthusiastic, to Desaugiers, who once lent the great advocate a penknife to cut a tight boot in the stalls of the Opera, all manner of men and women play their parts in these three hundred pages.

It is really time to ask when Sainte-Beuve's literary representatives are going to be tired of dragging his name and reputation through the dirt. *Le clou d'or* (4) consists of certain letters full of eighteenth-century sensibility (which is equivalent to a nineteenth-century word with the second and third syllables only changed), and addressed to a lady whom, from M. Jules Troubat's preface, it is difficult to believe that many persons in French society will not recognize. This preface itself is perhaps the most objectionable thing in the book, being full of a kind of sniggering suggestion which, at any rate to some people, is not a little offensive. Published without comment, the letters, though scarcely interesting, would at any rate have been comparatively harmless.

M. Vacherot has written (5) one of those pamphlets of very

haute politique which are more common abroad than in England. However, the author has nothing very new for us when he comes down from his altitudes. His notion is that Pan-Germanism, and not Panslavism, is the great danger of Europe.

M. de Pontmartin's *Samedis* (6) have had several things charged against them during their now pretty numerous years of existence, but dulness has rarely formed one of the charges. Nor are they dull now, though perhaps they approach that most formidable rock nearer than is their author's wont. M. de Pontmartin has fallen of late into a habit not unfrequent with literary men of a certain age and of strong political sympathies. He has begun to *prôner* young aspirants who seem to him to be of correct principles, and this is sometimes a little tedious for his readers. We are quite willing to allow M. de Pontmartin himself to argue about anything he likes, because his arguments are generally well-written and amusing, if frequently ill-natured. But it does not follow that all his geese and goslings are welcome too. Still this reproach does not lie against the whole of the present volume. It contains a really clever fantasy-piece called *L'assommoir à Athènes*, describing the intended production of the play on the Athenian stage, the opportune illness of the stage manager, the revolt of the actors, and the substitution, with shouts of applause, of the *Ulysses rex*. There is an interesting paper, too, on *Le livre de bord*, the anecdotes of which M. de Pontmartin supplements with some of his own. One of these assuredly must in some mysterious way have been derived from a well-known legend of Curll. It is to the effect that the late M. Michel Lévy once upon a time became dissatisfied with the titles usually affixed to their works by his authors. He thought they lacked *chic* and effect; and he accordingly engaged a trusty man, of whom he thought well, to extemporize a long list of titles, up to which authors more celebrated, but, according to M. Lévy, less gifted in the matter of titles, were to write. Nor is the last paper in the book to be read without interest. It is a notice of Gustave Flaubert, written shortly after his death, and it is a curious instance of the weakness of M. de Pontmartin's method. The critic practically says to us:—"Most of the people who admire M. Flaubert are Reds, immoral creatures, enemies of religion and order. M. Zola says that he is the child of M. Flaubert. Now anything that Reds, &c., like must be bad; and a bad son can't come from a good father. Ergo, M. Flaubert is bad too." The argument is, to say the least, insufficient; and it is at least remarkable that, so far as we have noticed, M. de Pontmartin does not so much as mention the *Tentation de Saint-Antoine* or the *Légende de St.-Julien*.

A habit, which we cannot but think a bad one, has grown up in France of composing books which are not exactly travels and not exactly novels. M. Lucien Biart and M. Victor Tissot are the great practitioners of this kind of work, which is for the most part represented in England only by boys' books. M. Biart's geographical and scientific accuracy is considerable, and M. Tissot's lively pen justifies itself sufficiently by its works; but the style, we repeat, is bad. Among workers in this style, though the purely fictitious element plays a much smaller part in her work than in some others of the kind, we should be inclined to rank Mme. Olympe Audouard (7). At least we hope that her account of a wolf hunt in which she was engaged is not to be taken absolutely at the foot of the letter. As Mme. Audouard represents herself as being driven twenty versts (i.e. fourteen miles) in half an hour, we may indeed take for granted that there are engaging little exaggerations. When Mme. Audouard had been driven the fourteen miles in the half hour, she changed sledges. Her companion, a Russian Count, gave her two revolvers, three rifles, and a hanger; tied a live sucking pig to the sledge, and set off. Mme. Audouard "philosophized" on the subject of the pig, but seems to have thought her duty ceased there. Meanwhile, the pig (being slowly flayed and dashed to pieces) squeaked, the wolves came up, and Mme. Audouard and the Count blazed away at them, the sledge going at full speed the while. They killed seventeen wolves—and the pig. Few of the scenes of Mme. Audouard's book are so lively, or, we may add, so offensive, as this. As a rule, she mixes up not ineffective descriptions of the Russia of to-day with scraps of history, social gossip, and remarks to the effect that the French in the Crimea liked the Russians much better than they did their English allies. It ought to be mentioned that the book is lavishly illustrated with very rough, but by no means ineffective, woodcuts. If it were not for the almost entire absence of dates, and the suspicious heightening of not a few of the anecdotes, besides that of the wolf hunt, the book would be rather an interesting one; but, as it is, it is neither fish nor flesh.

M. Victor de Laprade (8) apologizes in his preface for the terribly shocking title of his book. For an Academician in these days to write a book against music is, indeed, something revolutionary and altogether alarming. But, says M. de Laprade, people have mistaken him. He is not against music, but against certain misuses of music, and to prove it he publishes this book, part of which dates from a considerable time back, while part of it is sufficiently modern to contain a reference in very uncomplimentary terms to the recent exploits of the French Government in turning priests and women out of doors. This latter point is not a mere political fling, for M. de Laprade co-ordinates his objections to modern

music and modern democracy in a very original fashion. Democracy, music, and physical science—these are the three things to which the modern man is, in his view, addicted. A good deal of his argumentation is borrowed very ingeniously and quite avowedly from Plato, and follows a line which readers of the *Republic* will have no difficulty in drawing for themselves. M. de Laprade's great argument is that music without words is, if not exactly a mistake, at any rate a catachresis. It is meant to accompany words and to be subject to them, and its separate existence is a fond thing vainly imagined. At least this we take to be his argument; though the author, by alternately inveighing against music as it is and protesting his reverence for it as it should be, has somewhat confused his theme here and there. It is needless to say that the book is extremely well written. M. de Laprade is one of the few French writers upon whom the deluge of *argot* which has been the least satisfactory result of the Romantic movement, has broken without producing the slightest effect. He is purely classical in the best sense, and what his language wants in colour and movement it gains in elegance and statuesque precision.

M. Calmann-Lévy has been well advised of late in adopting for certain specially favoured works which he has published a somewhat uncommon *format*, which may be described either as very small quarto or as large square sexto-decimo. By this shape the advantages of margin and symmetrical form of page are gained without the corresponding drawbacks incident to most large paper octavos—the excessive size of the book and its consequent drag upon the hand. The critic is generally inclined to look kindly on a book satisfactorily presented in this way; for if the text be trivial, he can always look at the margin. We shall admit that, in reading M. Xavier Aubryet's little poem (9), or collection of poems, we have occasionally preferred the contemplation of the broad expanse of pleasant, rough-edged *papier vergé* to the reading of such lines as

Le ciel c'est une hermine; une tache à l'azur
C'est pour l'œil provençal ce qu'est pour un goût sûr
Le manque de justesse.

The truth is that M. Xavier Aubryet is much more at home in lively prose disquisitions *de omnibus rebus* than in these terrible French lyric measures, which make mediocre poetry a thing more intolerable than it is in any other language. In his Alexandrines he succeeds better; but here, too, we think we should have liked him better still in prose.

This certainly cannot be said of M. Leconte de Lisle, whose always welcome *Poèmes antiques*, after knowing a good many forms in their five-and-twenty years of life, now make their appearance once more in the "Petite bibliothèque" of M. Lemerre (10). We do not know that M. Leconte de Lisle pleases us so well in this, his most popular work, as in the *Poèmes barbares* and in some of his miscellaneous pieces, a good many of which, however, have been incorporated with the later editions of *Poèmes antiques*. There is, perhaps, nothing in this volume which has quite the vigour and *furia* of "Le Runois" and "Le massacre de Mona," or quite the poetical charm of "Requies." But since the Indian poems of the volume originally published as *Poèmes et poésies* were incorporated with the *Poèmes antiques*, these latter have made up one of the volumes which no one who wishes to obtain a satisfactory view of modern French poetry can afford to neglect. "Cunacepa" has always been one of the pieces best liked by the poet's special devotees, while of the strictly classical poems, "Pan," a short piece in Alexandrine couplets, extending to twenty-four lines only, is remarkable not merely for the masterly way in which the separate parts are crowded into the picture, and yet not overcrowded, but also because it is a typical example of the kind of poem which has been most affected in France for nearly half a century—the poem in which a picture complete, vivid, and carefully worked out in parts, is presented to the reader. There is, of course, no doubt that this confusion of the two arts has gone somewhat too far; but still it has produced sufficiently good work to make typical specimens of it interesting. It ought to be added that the scene "Hypatie et Cyrille" shows not a little dramatic power of a certain kind—that is to say, a kind to be judged according to the standard of Racine and not of Shakespeare.

The same "Petite bibliothèque," which is now becoming a "Grande bibliothèque," at least as far as the number of its volumes goes, has been increased by the addition of the fifteenth volume of M. François Victor Hugo's Shakespeare (11) and by the second volume of M. Aulard's version of Leopardi (12). The former contains the *Tempest* and the *Winter's Tale*. The latter is occupied for about eighty pages with prose versions of poems; for the rest, with translations of the "moral works"—that is to say, the prose talks, dialogues, and other miscellanies in which the Italian poet poured out his gall. The resemblance between certain of these latter and Landor's *Imaginary Conversations* is striking, and indeed it can hardly have escaped any reader.

French children have, as a rule, been very fairly off for books intended for their special consumption, though there is no

French Lewis Carroll. *Les infortunes de Chou-chou* (13) is a pleasant little story of a young woman of tender years, who had a too great tendency (like some other young women not of tender years) to cry at everything without rhyme or reason. It is illustrated prettily enough, but cannot in this respect compare with M. Girardin's and M. Assollant's books for boys, especially with the latter. *Grand-père* (14) is, like all its author's legends of schoolboy life in the provinces, very natural, and very free from anything that is objectionable, though perhaps an English boy would like it better, and would be right in liking it better, without its rather unnecessary codicil in which the hero has a wife chosen for him. By great good luck she happens to be the one he would himself have chosen; but this is an accident. M. Assollant is, in familiar phrase, a cut above the general run of boys' book-makers in England, and *Pendragon* (15) has style and literary merit as well as movement and colour. The hero is a Gaulish chief, who serves in the armies of Alexander the Great, and who, of course, performs wonders mounted on a terrific steed, which is represented in the illustrations after a fashion calculated to cause the pleasantest alarm. M. Deslys (16) is also a writer of no small powers, and his volume, like the others previously mentioned, is abundantly illustrated. It contains three separate tales intended for perhaps rather older readers.

(13) *Les infortunes de Chou-chou*. Par Mme. Colomb. Paris: Hachette.

(14) *Grand-père*. Par J. Girardin. Paris: Hachette.

THE QUEEN'S SPEECH—IRELAND.

AS the material points of the QUEEN'S Speech had been communicated to the daily papers a day or two before the meeting of Parliament, public curiosity was concentrated on the impending debate, or rather on Mr. GLADSTONE's explanation of the policy of the Government. Lord BEACONSFIELD, Sir STAFFORD NORTHCOTE, and any of their supporters who might take part in the discussion, could only express with more or less force the general conviction. It will be admitted that the two leaders of the Opposition satisfied general expectation by the mode in which they discharged a not very difficult duty. Lord BEACONSFIELD proved that he had warned the country and his successors of the impending danger, and that he had proposed not only to renew the Peace Preservation Act, but, if necessary, to render its terms more stringent. He was answered by Mr. GLADSTONE's assurance that Ireland had never been so prosperous or so generally contented as at the date of the change of Ministry. Sir STAFFORD NORTHCOTE's speech was still more effective; but the question between the two parties has little interest or importance. If Lord BEACONSFIELD and his colleagues had been deficient in foresight and in firmness, their shortcomings furnish no excuse for any neglect of duty by the present Government. The task of delivering the Ministerial apology afforded occasion for the exercise of Mr. GLADSTONE's peculiar genius. He had to master two inconsistent propositions; and no orator is more capable of tolerating and reconciling contradictions. It was necessary to vindicate the determination to provide in January for the maintenance of order which has been disturbed since September or October without official interference. If he is right now, he was wrong three months ago, for the excuse that it was desirable to wait till public opinion became unanimous is but a transparent evasion. It was little to the purpose to cite instances in which former Governments have been timid and dilatory. Such precedents furnish warning rather than example, even when they are not disinterred from obsolete records. Mr. GLADSTONE actually thought it worth while to quote a speech delivered by Mr. PEEL in 1814, when he was a young man of five-and-twenty, lately appointed to his first subordinate office. If it were worth while to investigate the circumstances, no surprise would be caused by the discovery that Lord LIVERPOOL's administration of Irish affairs was not extraordinarily prescient or vigorous.

Mr. GLADSTONE laid great stress on the prosecution of Mr. PARNELL and his associates as an experiment by which the efficiency of the existing law might be tested before exceptional measures were proposed. It might have occurred to the ingenious apologist that the prosecution has, whether it ends in acquittal or conviction, already done its best and its worst. The verdict of the jury can in no way affect the undoubted fact that the Land League has established its despotism in the greater part of Ireland, and that ordinary justice is entirely suspended. By introducing a Coercion Bill while the prosecution is still pending the Government distinctly admits the absence of cohesion between the measures which are required and the solitary effort which has been made to check or punish one form of crime. The wholesale acquisition by the Irish populace of firearms, largely supplied, it is said, by Mr. CHAMBERLAIN's constituents, could not possibly be prevented or discouraged by the indictment of Mr. PARNELL.

The great majority of the agents of the Land League and of other agrarian conspirators have no concern in the trial, though they will of course boast of a triumph if the jury should be intimidated. It was, in truth, impossible to devise any reason for the delay which would not be an argument against the Coercion Bill itself. It is satisfactory to learn that the measure is to take precedence of other business, and it may be inferred that Mr. GLADSTONE is prepared with some scheme for repressing the obstruction which has been threatened by Mr. PARNELL. It is not undesirable that his pugnacity should be partially diverted from his ordinary opponents to the enemies of free Parliamentary debate. In any feasible plan for the defeat of efforts to obstruct business he will be cordially supported by the great majority of the House.

The conduct of Mr. BRIGHT and Mr. CHAMBERLAIN will be observed with curiosity and perhaps with amusement. In his exposition of the reasons for postponing coercion, Mr. GLADSTONE omitted to mention the decisive cause, which was the successful resistance of his Birmingham colleague to the policy which is supposed to have been recommended by Mr. FORSTER. When, as it is believed, the Cabinet was hesitating, Mr. BRIGHT propounded the marvellous doctrine that force was no remedy for anarchy caused by discontent. Neither Mr. BRIGHT nor Mr. CHAMBERLAIN qualified their repudiation of a policy of coercion by any reference to times and seasons; nor did they pretend to rely on the efficacy of the State prosecution. They produced, and probably intended to produce, the impression that their colleagues must choose between license to Irish crime and the continuance in office of the extreme Radical section of the Ministry. It was, on the whole, thought better to give over Ireland to the dominion of the Land League than to lose the support of the great democratic orator and of the chief manager of the Birmingham Election Club. For every crime which might have been prevented by the earlier suspension of the Habeas Corpus and by the disarmament of the disaffected population, Mr. BRIGHT and Mr. CHAMBERLAIN are not exclusively responsible, because their colleagues submitted to their dictation. It will henceforth be convenient to discontinue as far as possible the retrospective criticism which is unavoidably suggested by Mr. GLADSTONE's apology. If the Government will at last do its duty, it ought to be supported, inasmuch as no competitors are ready to take the place of the present Ministers. Even the conduct of Mr. BRIGHT and Mr. CHAMBERLAIN may be condoned now that they have practically acknowledged their error.

Mr. GLADSTONE was probably well advised in referring but vaguely and slightly to the measure which he intends to introduce with respect to the tenure of land. It is to be founded on the Act of 1870, which he still regards with complacency, though he will be compelled to retract the assurances with which the measure was defended at the time. It may be collected from Mr. GLADSTONE's statement that some legislative control over the amount of rent is to be established, and that the machinery by which Mr. BRIGHT's Clauses were to be worked is to be rendered more effective. The Report of the Irish Land Commission includes a recommendation of the "three F's"; but it is only signed by three Commissioners out of five—Lord Bessborough, Baron Down, and Mr. SHAW are at issue with Mr. KAVANAUGH and The O'CONNOR DON. It is but a barren inquiry whether a Land Bill ought to have been post-

poned until the Coercion Bill was passed. The choice necessarily lay with the Government, and Parliament and the country must acquiesce in the decision. It is certainly unfortunate that any organic legislation which can be defended as expedient and equitable should appear to have been extorted by violence. There is still less reason for spontaneous concessions such as that which is mentioned in the Speech. The proposal of County Boards in Ireland seems in a high degree injudicious. The constitution of the Grand Juries is in some respects anomalous; but their powers are limited, and there is no urgent need of a change. The disaffected part of the population will rightly interpret the measure as a partial admission of the principle of Home Rule. If County Boards are created, it is inevitable, in conformity with the precedents of modern legislation, that they should be elected by numerous and poor constituencies. Although it will be their nominal function to levy and administer rates, it is certain that property will not be adequately represented. At the risk of arousing prejudice, it may be well to assert that nothing is at present likely to be more injurious to Ireland than an extension of elective institutions. Among the Irish members are many persons of a class which never ought to enter the walls of Parliament, and even their less discreditable colleagues have no pretension to represent the property and intelligence of Ireland. It will not be the worst peculiarity of County Boards elected by the same constituencies that they will probably perpetrate the grossest jobbery. It is certain that they will be employed by agitators for political purposes, and especially to promote the disruption of which they will be considered an instalment. Even if the measure had been more expedient in substance, it is at the present time wholly inopportune. If the Government resolved to countenance the claims of the revolutionary faction by making a change in land tenure the condition of suppression of disorder, it is unnecessary and undesirable to coax and wheedle the malcontents by irrelevant concessions. The powers of the Grand Juries are not even included in the current list of popular grievances. The county Land Leagues will gladly accept the invitation of the Government to transform themselves into County Boards.

THE QUEEN'S SPEECH.

NOTHING could have been more modest and curt, not to say bald, than those parts of the QUEEN'S Speech which referred to other than Irish matters. The QUEEN'S relations with foreign Powers continue to be friendly and harmonious. This is always said, unless the country is on the eve of a war. What is the real extent of friendship and the exact character of the harmony is what we should like to know; but this is the very thing that it is impossible to disclose in a short and formal paragraph. The main question relating to the frontier between Turkey and Montenegro has been settled. This is true, and is no more or less than the truth. The main question has been settled, subsidiary questions have not been settled. Criticism is studiously deprecated by an utter absence of glorification in the result, and of reference to the means by which the result was attained. The Powers are now engaged in communications which have in view the determination of the frontier between Turkey and Greece. This is a good, bald, dry fact. The Powers are indisputably so engaged, but whether these labours are likely to lead to anything, or at what result it is desirable they should arrive, we know no more after reading the QUEEN'S Speech than before. Some unfulfilled portions of the Treaty of Berlin continue to occupy the attention of the QUEEN and her Government. There are many unfulfilled provisions of the treaty, and if they are all occupying attention, they must be making a heavy demand on it. A little more explicitness is shown when the turn comes of the Basutos and the Boers. Friendly mediation is proffered between the natives and the colonists; and it may be hoped that such an end to the contest may be possible and effectual; but from a technical point of view it is strange to hear of a Sovereign mediating between two sets of her subjects as if she was mediating between Chili and Peru. The Boers by their precipitate recourse to arms have made inevitable a postponement of that almost complete freedom which was about to be bestowed on them. Lastly, the war in Afghanistan has been brought to a close, and, with the exception of

the Candahar force, all the QUEEN'S troops have been recalled within the Indian frontier. It is not the intention of the Government to retain Candahar permanently; but the still unsettled state of the country and the consequent difficulty of establishing a native ruler have delayed for a time the withdrawal of the army from that position. This tells us, indeed, if any one can have supposed it doubtful, that it is not the intention of the Government to make Candahar a part of the territory of British India. But it leaves us entirely in the dark as to when Candahar will be evacuated. The country is said to be still unsettled, and there is no native Government to which Candahar can be given over. What we are to do with Candahar is, therefore, uncertain as it was when Sir FREDERICK ROBERTS relieved it. The QUEEN concluded this part of her speech by informing Parliament that further correspondence on the Military Estimates of India would be laid before it; and it needed the subsequent explanation of Mr. GLADSTONE to understand that this laconic and mysterious phrase meant that the materials now existed for asking a decision on the difficult and anxious subject of the proper contribution of England to the expenses of the war.

The principle on which the Speech was framed is sufficiently obvious. The real business of the Parliament is to deal with Ireland. It is Ireland that absorbs the attention which is conventionally supposed to be occupied with the constitution of Macedonia or the woes of the Armenians. It was Ireland, and Ireland only, as to which there was a keen anxiety to know the intentions of the Government. Other subjects had to be noticed, but they might be so noticed that criticism and information should alike be minimized. They had to appear on the scene, but they might be arranged like the bodyguard of a prince, which, if it is but decently and simply dressed, escapes notice. Some criticism was, of course, unavoidable. It is the business of the leaders of the Opposition to criticize every part of the QUEEN'S Speech, and Lord BEACONSFIELD went through his task in one House, and Sir STAFFORD NORTHCOTE in the other. The choice of the line which criticism was to take was, however, limited. There was the criticism that there was nothing to criticize, that nothing had been told, and that by an exaggerated reticence the Government had left Parliament entirely in the dark as to the past, the present, and the future. This was the line Sir STAFFORD NORTHCOTE adopted, and Mr. GLADSTONE could only say in reply that the supplement to the QUEEN'S Speech was to be found in a recent speech of Lord GRANVILLE. The real reply would have been that Parliament and the Government equally wished that attention should for the moment be exclusively directed to Ireland. Lord BEACONSFIELD could scarcely be satisfied with this sort of negative comment, and set himself to attack the general policy of the Government. In doing this he had the choice of two lines. He might have shown with great effect that the present Government has stolen the clothes of the last Government. In spite of all the fiery denunciations and wild assertions of the Midlothian campaign, Mr. GLADSTONE has no choice but to carry out the Treaty of Berlin. The Government is hurrying forward troops to sustain the authority of the QUEEN in the Transvaal, the acquisition of which was described by many members of the Government as a piece of sheer robbery. The late Government almost immediately before its fall declared that it desired no accession of territory in Afghanistan, but must endeavour to find some trustworthy native to take over, not only Cabul, but Candahar. This is in almost so many words the policy announced in the QUEEN'S Speech. Sir STAFFORD NORTHCOTE always said that England would do something to help India in the cost of the war, but could never decide how much ought to be done, and this is precisely where the QUEEN'S Speech leaves us. Nothing, it might easily be made to appear, could be a greater tribute to the soundness of the policy pursued by the late Government than the curious completeness with which the present Government has found itself obliged to walk in its steps. But from a party point of view there was a most serious objection to taking this line of criticism. It would have given the Opposition a great momentary triumph, but it would have much hampered it in the future. If it had owned that the policy of the Government was its own policy, how could it say that this policy was wrong? It would have had the pleasure of patronizing the Government; but the business of an Opposition is not to patronize, but to attack. Lord BEACONSFIELD,

therefore, boldly adopted an exactly contrary line of criticism, and alleged that the policy of the Government was a startling and an unpatriotic departure from the policy of its predecessors. The facts might have been thought to point to an opposite conclusion. But it was the business of Lord BEACONSFIELD not to trouble himself about facts so much as to get his party into a position for effective attack. He, therefore, made the Government a present of a character for boldness and originality, but this was a small sacrifice in comparison with the gain of getting a clear field for arguing that everything the Government may do or has done is wrong.

Parliament is to have other business brought before it by the Government when the main Irish Bills are disposed of; but the Government has been extremely moderate in carving out other than Irish business. Its Bills are only Bills which it could not help bringing in, or which excite a languid and a local interest. Corporal punishment is to be abolished in the army and navy. This is merely a fulfilment of what was announced last Session, and it is the only measure that can be said to be of a party character. Every other measure announced would as naturally have been prepared by a Conservative as by a Liberal Government. A Bankruptcy Bill is a simple necessity. It is a scandal that it should have been so long postponed; and, if the new Bill differs from that brought in by Lord CAIRNS, it will differ only so far as further discussion and more experience may have shown how the Bill of Lord CAIRNS can be advantageously modified. The general nature of a Bankruptcy Bill, by whichever party it may be prepared, is now clearly determined, and it is not so much interesting to know that a Bankruptcy Bill is to be prepared as to hear that it is to be placed in the charge of Mr. CHAMBERLAIN. It will give scope to his superabundant energy, and that it should be confided to him is a recognition of the important fact that a Bankruptcy Bill is the proper affair of traders rather than lawyers. The difficulty is to decide how trade can best be carried on rather than to shape clauses. Two little Bills follow which are no doubt very useful and necessary. Something is to be done to regulate floods, and something more to regulate Scotch charitable endowments. These are measures of local importance, but they can scarcely excite any party feeling, and they only find their way into the QUEEN'S Speech because it would have been difficult to find any measures better calculated to keep the end of the Speech to a neutral tone. The general discussion of the effects of the Ballot Bill, which to the legitimate discontent of the Opposition was evaded last Session by the device of a Continuance Bill, is this year to occupy a proper share of the attention of Parliament; and recent disgraceful disclosures, which have equally affected both parties, will prompt an equal ingenuity on both sides to devise new methods of stifling or baffling electoral corruption. When the Government discloses the contents of these measures there will be abundant room for the expression of varieties of opinion; but there is nothing exciting in the knowledge that these are the measures as to which the Government will take the opinion of Parliament. None of them raises a burning question, and in a Session which will see the flaming question of Ireland glare so fiercely, it is prudent to keep down everything else to the lowest possible level of excitement.

THE REVOLT IN THE TRANSVAAL.

THE alleged moderation of the insurgent Government of the Transvaal can be only conventionally supposed to indicate the probability of a compromise. The leaders of the revolt graciously offer to receive an English Consul at Pretoria, and even to take into future consideration some measure of a federative character. In return, they require the concession of independence, which is the only issue raised by the insurrection. The organs of the English Government have not thus far recommended absolute and immediate submission; and the Boers have evidently determined not to resume their allegiance until they have tried their strength in the field. They are probably aware of the scanty number of Imperial troops in South Africa, and they have perhaps not anticipated the immediate

despatch of reinforcements. The unnecessary hurry in which both the late and the present Governments withdrew the troops after the end of the Zulu war has probably been interpreted as a proof that English forces were not again to be employed in South Africa. Many unwise statements to that effect have been made in newspapers and at public meetings, and it was not unnaturally supposed that the colonists of the Cape agreed to a policy which would complete their practical independence. During the Basuto war the Cape Government has asked for no aid from home; and, on the other side, there has been no officious offer of support. The Transvaal leaders have apparently satisfied themselves of their ability to deal with the only forces of which Sir GEORGE COLLIER can immediately dispose. Their hopes will have been confirmed by the hitherto unexplained defeat of an English detachment. The general result is unfortunately not doubtful; but it is difficult to believe Mr. JOUBERT'S account of the combat. He asserts that, on the refusal of the officer in command to suspend his march, the detachment, after an exchange of one or two volleys, capitulated in a few minutes to an inferior force of raw volunteers. The statement has since been to some extent authoritatively contradicted. It appears that the first account of the slaughter resulting from a surprise was not inaccurate.

The rumour of an alliance between the Boers of the Orange Free State and the insurgents in the Transvaal is likely to be well founded. Mr. BRAND, President of the Free State, has for the most part maintained friendly relations with the Imperial and Colonial Governments, though during his visit to England three or four years ago he gave no encouragement to Lord CARNARVON'S proposal of federation. During the Basuto war the colonial forces have been allowed to pass freely through the territory of the Free State, until the approach of the outbreak in the Transvaal, when difficulties were for the first time raised by some of the local authorities. In ordinary times the Dutch of the Republic probably understand that the white population of South Africa has a common interest in repressing the pretensions of the natives to independence. In disarming the Basutos the Cape Government was incidentally securing the neighbouring Free State from the possible hostility of a formidable enemy. Residents in the country may perhaps not share the disapprobation of Mr. SPRIGGS'S policy which has been expressed both by professed philanthropists and by official politicians in England. The earlier disasters of the conflict had apparently been redeemed, for all recent accounts concur in representing the colonial forces as generally successful, especially in the capture of large numbers of sheep and cattle. The whole conditions of the struggle may be reversed if the Orange Free State is closed to the English columns. The vast and thinly-inhabited territory of the Republic extends along the entire length of the Basuto country, and separates it from the colony. The rebellious natives would be quick to discern the difficulties of their adversaries; and they would also perceive that during the continuance of the war in the Transvaal they have little to apprehend on the side of Natal. That a virtual alliance with uncivilized tribes against European supremacy would be suicidal is no security against its being adopted under the influence of passion and prejudice. It is possible that the Boers of the Free State may attempt to distinguish between the interest of the Cape Colony in coercing the Basutos, and the claim of the English Government to the sovereignty of the Transvaal; but such an attempt would certainly fail. Any assistance which may be given to the insurgents will effect a diversion in favour of the Basutos.

In less scrupulous times a Government suddenly, if not treacherously, attacked by rebellious subjects, would not have hesitated to use all the means which could be discovered for checking and punishing the insurgents. It is believed that the Boers have long before their declaration of war set the example of resorting to native assistance; but the Imperial Government cannot ally itself with savages against civilized opponents. It has, in fact, though not of set purpose, relieved the Boers of the Transvaal from contingent dangers which might perhaps have deterred them from insurrection. SECOCOENT, who had brought the former Republic to the verge of destruction, and CETEWAYO, who had repeatedly announced his intention of washing his spears in the blood of the Boers, have

both been crushed by English arms since the date of the annexation. If the two potentates still threatened the frontier of the Transvaal, the English protectorate would have been endured, even if it had not been cordially liked. A section of Dutch politicians at the Cape has encouraged the separatist tendencies which could not fail to display themselves in the Transvaal. One of the inconveniences of popular government of the modern type is the inevitable existence of an Opposition which naturally occupies itself in thwarting the policy of the Government. The mischief is aggravated in communities where there are jealousies of race as well as party dissensions. The well-advised part of the Dutch population probably welcomed the resumption of English allegiance by a community of their own blood and language. Though federation has been postponed, the English provinces will inevitably hereafter form some kind of political union, either by a federal constitution or by the extension of the limits of the colony. In such a contingency the Dutch element would be reinforced by the addition to the Cape of the wide region of the Transvaal. It is not surprising that another party should resent the annexation of a Dutch province which had for some years enjoyed independence. The singularly inopportune time and manner in which the union was effected furnished abundant ground for adverse criticism; but, on the whole, the sounder view seems, down to the recent rupture, to have prevailed at the Cape. The subject of the Transvaal has been rarely discussed in the colonial Parliament; and Sir BARTLE FRERE's extraordinary popularity was in no degree impaired when, as the organ of the Imperial Government, he had informed the Transvaal remonstrants that there was no prospect of the restoration of their independence. Mr. SPRIGG and his colleagues may justly take credit to themselves for the general suspension during their term of office of apparent antagonism between the English and the Dutch. Sir G. COLLEY's judicious language will tend to allay any tendency to natural jealousy which may exist among the Dutch of the colony. He shows both good taste and sound judgment in warning the troops who may be engaged in the contest that the Boers of the Transvaal are brave men of civilized rank. It is left for passionate and irresponsible declaimers to denounce by anticipation as cowards the yet unsubdued descendants of one of the bravest nations of the world.

It is well that the concurrence of both political parties in the blunder perpetrated at the Transvaal will prevent recrimination, or at least render it innocuous. Neither Lord KIMBERLEY nor Mr. GLADSTONE at the time disapproved of the annexation, and Lord KIMBERLEY's former subordinate at the Colonial Office publicly, and without remonstrance from his superiors, applauded the measure. Mr. GLADSTONE, indeed, afterwards denounced with characteristic significance the forcible substitution of monarchical rule for Republican institutions; and, in his animosity against Lord BEACONSFIELD's Government, he declared that the independence of the Transvaal ought to be restored; but he had estopped himself from objecting to the transaction by not protesting at the time, and he afterwards repudiated his later pledge when he had official power to redeem it. It oddly happens that almost the only member of Parliament who has been consistent in denouncing the annexation is admitted to the ranks of the Administration at the very moment when the Transvaal has risen in insurrection. It is possible that the leaders of the rebellion may be encouraged by the promotion of their most conspicuous advocate; but the coincidence of the appointment with the outbreak of war was probably accidental; and it would have been hard on Mr. COURTNEY to be excluded from office merely because he had happened almost alone to take the correct view of an important political question. If the vacancy had occurred in the Colonial Office instead of the Home Office, it would not have been convenient to appoint a declared opponent of the policy to which the Government is committed. There is no reason to doubt that Lord KIMBERLEY will act consistently with his former policy, and his intentions will be vigorously expounded in the House of Commons by Mr. GRANT DUFF.

THE RUSSIANS IN CENTRAL ASIA.

FOR persons who delight to exercise their powers of political and military divination, there is probably no subject so promising at the present time as the progress of the expedition which, under the command of General SKOBELEFF, is striving to vindicate the prestige of Russia, to avenge the defeat of Geok Tepe, and to open the route to Merv. For many months since, and even before the collapse of LAZAREFF's attempt, the sources of intelligence on the subject have been almost wholly Russian. When the Czar's Generals turned away correspondents from their camp, one only, the Correspondent of the *Daily News*, persevered in the attempt to tap some new source of information. After long hanging about in the Astrabad district, this Correspondent journeyed to Teheran, and thence to Meshed, the chief town of the North-Western frontier district of Persia, where, with not a little difficulty, he obtained permission to try his chance among the robber tribes who strike equal terror into Russians and Persians. From Meshed he made his way to Derguez or Derogez, the last station on Turkish territory, a short distance only from Askabad, the capital of the Western Turkoman tribes, and a somewhat greater distance from the guarded hold of Geok Tepe itself. Farther than this he does not seem to have hitherto succeeded in getting. This Correspondent, however, who is not actually on the spot, and whose messages have to find their way by the circuitous route of Meshed and Teheran, is absolutely the only source of anything like first-hand or rather of good second-hand information, independent of the Russian official bulletins, or of such rumours as may leak out as to the real contents of the telegrams sent by General SKOBELEFF. Of these the first are almost entirely untrustworthy; the second, for the most part guesses, come either from St. Petersburg or from Vienna, and require to be taken with an inordinate number of grains of salt. It is only by putting two and two together, and venturing not a little in the way of conjectural interpretation, that anything like a probable account of what is actually going on can be made up.

One thing is as nearly as may be certain, and that is that in Christmas week important engagements took place; and it is also very nearly certain that these engagements resulted in loss to the Russians, perhaps in loss not very much less than on the former occasion when they went down before the fiery onset of the desert cavalry. The situation had been known to be growing critical for some time. General SKOBELEFF had gradually been accumulating the resources upon which he intended principally to rely for his attack on the Tekke stronghold; that is to say, a very large number of guns and mitrailleuses, an arm in which he was certain to meet with little opposition in kind, and which might be thought likely to produce especial effect on undisciplined foes, defended only by mud walls. It was also rumoured, though this rumour rested on somewhat slender foundation, that General KUROPATKINE had come to his aid with a considerable Russian force from Samarcand and the Eastern Khanates. This latter item of intelligence was extremely important if true, for hitherto the road from the north and east to the Tekke oases had been considered simply impassable. A single caravan track is marked on the map from Khiva to a point considerably to the eastward of any that the Russians have yet reached; another from Khiva to Merv; others again from the course of the Amu Darya to the same place. But these latter, passing through the territory of the Merv Tekkes—more numerous, warlike, and hostile than the Akkals themselves—might be considered as hopelessly out of the question, and any Russian expedition which, starting from Charjui or elsewhere on the great river, should reach Geok Tepe, would have made its way by a practically new route. General KUROPATKINE's arrival, therefore, at least in any force, seemed in the highest degree improbable. At the same time it was certain that the Tekkes had received considerable reinforcements—certain because the rumours to that effect were confirmed independently from the source already alluded to, the force having passed close to Derogez. This reinforcement amounted, it was said, to eight thousand men mounted on camels and asses, and having some few guns with them. Whether these had actually joined the defenders of Geok Tepe or not at the time of fighting cannot be determined. But it seems that on Christmas Eve an engagement, and no small one, was fought.

Putting the Russian official account and the independent report together, it seems that General SKOBLEFF, annoyed at the successful attacks of the Tekkes on his communications, ordered either a regular attack or a reconnaissance in force, that he was stoutly resisted, that he had to bring up reinforcements, and that finally he had to retreat to Bami. Two guns are said to have been lost, but recovered by the Russians; and the same semi-official source declares that the loss of the Turcomans from mitrailleuses and artillery was very heavy, while the Russian loss was a doctor wounded, a soldier killed, and three men wounded. Now here, as constantly in reference to this Central Asian matter, the Russians have shown themselves unskilful in the art of cooking despatches. Seven companies of infantry, two hundred cavalry, and artillery to match are not usually able to fight for four hours with twenty thousand men who show daring and persistence (we give the Russian figures and phrases), at the cost of one man killed and four wounded—among them not a single combatant officer. Nor is a retreat, after the loss (even if it were followed by recapture) of guns, usually allowed by victorious troops in vastly superior numbers, and almost wholly mounted men, to take place on such terms. It is extremely probable that the vague Persian report subsequently received of a Russian loss of three thousand is exaggerated the other way. But it will take a good deal to persuade most people that the invaders have not suffered another serious repulse, and this is, it seems, the apprehension felt in St. Petersburg. This apprehension may be unfounded, but the Russian Government has only to thank for it the persistent and bungling mendacity of those who concoct its bulletins in this Turcoman matter.

The important thing for Englishmen, of course, is not so much the fact of this particular Russian reverse, but the effect that it is likely to exercise on the whole plan of the Russian expedition. At present the deliberate judgment of all competent observers at a distance, corroborated by that of the only competent observer anywhere near the spot, is that the CZAR'S advisers are bent on the present conquest and annexation of the Akkal Tekkes, to be followed, though at an indefinite period, by similar action in respect to Merv. It is thought, however, that, in gratitude to HER MAJESTY'S present Government, and as a consideration for value received, action against Merv is likely to be stayed. But, although this new reverse, if it be a fact, would show the difficulties which await the Russians in their progress eastward from the Caspian, the Russian commanders in these out-of-the-way districts are not wont to be discouraged by difficulties. That nothing can prevent them in the long run from getting the better, unless Persia took up a resolute attitude of unfriendly neutrality, seems certain, and that Persia is, especially in existing circumstances, extremely unlikely to adopt any such attitude, is all but certain. The presence of the victor of Maiwand undisturbed at Herat, and the announced withdrawal from Candahar, may be said to settle this question: The Persians would hardly be sensible men if they refused to wink at one powerful neighbour suppressing a very troublesome set of other neighbours, the refusal being for the sake of a third neighbour, who is far off, who is apparently indifferent about the matter, and who carries her indifference so far that she does not even care to avenge her own wrongs or keep her own conquests in the same part of the world. But, in reality, the point of importance in the late intelligence is the truth or falsity of the arrival of General KUROPATKINE in the Akkal settlements from the Amu Darya. That arrival, unless it was a mere exploring party that accompanied the General, would settle the question as to the power of Russian troops to traverse easily, and with comparative rapidity, the belt of desert which separates their actual central Asian possessions from the Persian and Afghan frontiers. The confidence of those who believe in the inaccessibility of India was, or ought to have been, not a little shaken by the easy march of AYUB with guns and troops of all arms from Herat to Candahar. The march of KUROPATKINE, if it were a fact, from the Amu Darya to the neighbourhood of Gook Tepe, would be an additional shock of the same kind. Certain partisans of the "backward" policy would appear to meet this by a sufficiently original argument—"If your frontiers are too accessible, push them back." As an argument *pour rire* this is good; for any other purpose it is scarcely worth serious consideration. The absence of confirmation of the KUROPATKINE march and the presence

of confirmation of SKOBLEFF'S defeat would, of course, be satisfactory enough in their way. But whether they would do more than adjourn the day of the Tekkes' overthrow is doubtful. Even putting selfish considerations apart, it is impossible to avoid regret at the uselessness of such displays of valour on the part of a brave people borne down by the sheer brute force of an enormous and unscrupulous Empire.

THE LAST SPEECHES OF THE RECESS.

THE speeches delivered on the eve of the meeting of Parliament close a definite stage of political controversy. The issues on which parties are divided will henceforth be more clearly defined, and the policy of the Government will be judged not by mere conjecture, but in reference to official apologies and declarations. During the recess, the Government has derived a certain advantage from the inability of friends and enemies to comprehend its obstinate inaction. It seemed that there must be some reason for a course which admitted of no obvious explanation. In default of plausible conjectures, it only remained for both parties to confine themselves to obvious commonplaces. Ministerial speakers at all hazards applauded the determination of the Government to abide by the law, however inoperative it might prove, in the shape in which it happened to exist at a critical moment. It has never been explained why a certain machinery for the protection of life and property should be indefensibly sacred, even when it has ceased to perform the function for which it was designed; but partisans have a natural propensity to satisfy themselves with cant. Their leaders have indulged their taste with contemptuous indifference to reason and to plausibility. Force, according to Mr. BRIGHT and Mr. CHAMBERLAIN, is not the proper remedy for discontent. Other purveyors of sophistry quote the lackeyed and misunderstood assertion of CAVOUI, that any man can govern with a state of siege, forgetting that in the meantime Ireland has not been governed at all. Sir WILFRID LAWSON at a meeting a few days ago at Cockermouth caricatured the language of faction by attacking the late Government in language which had the fault not only of injustice but of anachronism. The dullest Liberals, notwithstanding their unwillingness to admit new impressions, must be tired of sweeping denunciations of Lord BEACONSFIELD and his policy. A year ago there might be some pleasure in hearing that the Ministers of the day were guilty, according to Sir WILFRID LAWSON, of "murder, robbery, false witness, and stealing." Of late they have neither murdered nor robbed, nor have they even engaged in a naval demonstration.

Remembering at last that even a liberal audience is likely to be thinking rather of the Land League than of Lord BEACONSFIELD'S delinquencies, Sir WILFRID LAWSON thought fit to assert that "the melancholy state of Ireland is very much due to the proceedings of the late Tory Government." They had been in power for six years, and they had not redressed any of the crowning wrongs of Ireland. As the crowning wrongs, if they mean anything, consist of the tenure of land, it seems unreasonable to blame the late Government for not reopening the questions which they found freshly settled by the Land Act of 1870. Their predecessors had undertaken to solve the problem, and within ten years it was too soon to assume that the experiment had been fully tried. It is true that the late Ministers involved themselves in some unnecessary squabbles with the majority of Irish members. They might prudently have deprived them of an excuse for factious opposition by assenting to slightly mischievous Bills for the reduction of the Parliamentary and municipal franchise. The admission to the suffrage of the lowest rabble could not alter for the worse the representation which includes the tradesmen and adventurers who are the principal members of the Land League. On the other hand, the Home Rule party cared but little for the rejection of their measures, and the result of six years of Tory rule was, if Mr. GLADSTONE may be trusted, a condition of loyalty and content which had never before been known in Ireland. The Government was not, even by its adversaries, held responsible for the failure of crops in 1879; and it showed no want of good will and activity in providing for the consequent wants of the population. The distress was subsiding when Mr. GLADSTONE, for his own purposes, discovered the existence of universal peace and good will.

It was at the moment necessary to account for the non-renewal of the Peace Preservation Act, which could not directly have been allowed to expire, if there had been the smallest foundation for Sir WILFRID LAWSON's charges.

Mr. COWEN deals with political questions in a more serious spirit than Sir WILFRID LAWSON; and his independence and originality of thought always render his speeches worthy of attention. A great part of an address which he delivered to his constituents a few days ago was occupied with subjects which have lately fallen into the background. Mr. COWEN condemned, not for the first time, the artificial arrangements by which the Birmingham League suppresses independence and withholds toleration. To a politician who, though a zealous democrat, has a sincere attachment to freedom, the substitution of a factious oligarchy for a large constituency justly appears to be a gross abuse of electoral power. Those inhabitants of Birmingham and its confederated towns who decline to ally themselves with the dominant party are as completely disfranchised both for local and Imperial purposes as the Roman Catholics of two centuries ago. Mr. COWEN, a Liberal of the Liberals, was strong and popular enough to defy the Newcastle offshoot from Birmingham; and consequently the Liberal Association tendered its submission to a resolute antagonist. He now repeats his well-founded objections to an organization which is nevertheless perhaps a necessary result of a widely extended franchise. A similar system in America has been found irresistible. In England the Liberal Associations have not yet reached the stage in which they will be manipulated for purposes of corruption by professional managers. The actual leaders are content with the assertion of their own political supremacy, and with the exclusion of their adversaries from all share in the administration of the revenues to which they contribute. The abortive attack on Mr. COWEN was provoked by his independent action in matters of foreign policy. In his late speech he called attention to the sudden subsidence of the agitation which he had not feared to encounter at its height.

By always adhering to his own convictions, Mr. COWEN has in a certain sense earned the right to be sometimes in the wrong. It is known that his errors are not the result of servile deference to party; yet it has never been easy to understand his tenderness for Irish agitation, and even for the theory of Home Rule. In his late speech he denounced "the resort to the old, vicious, and ignoble device of coercion, 'the nostrum,' as he oddly remarked, 'of all timid political physicians since the days of DRACO.'" It had not been known that DRACO introduced measures for extraordinary coercion by suspending the Habeas Corpus, or in any other form. DRACO's vigorous legislation probably required no occasional supplement in the nature of Peace Preservation Acts. The practice of "Boycotting," which Mr. COWEN describes as a vast system of exclusive dealing, is not, in his judgment, illegal, if not supported by terror or conspiracy. It is notorious that in fact the system depends exclusively on terror, inasmuch as those who refuse to share in the enforcement of social excommunication are in every instance threatened or punished. Mr. COWEN cannot even in this instance be accused of subserviency to the Government which, as he had reason to know at the time, had already resolved to introduce a Coercion Bill. One charge which he made against the Ministers was scarcely just. "Except the Law Officers and a few courtiers, there was not an Irishman in the present Government." A short time ago there was an Irish Under-Secretary in the person of Lord LANSDOWN; but the Government cannot appoint Irish commoners to office because they would forfeit their seats. Mr. GLADSTONE had the merit of defying a foolish clamour which he probably anticipated by appointing a Roman Catholic Irish nobleman to a high Court office. Since that time, Lord KENMARE has been driven by the Land League from Ireland, where he has also been compelled to discontinue improvements of the land which provided remunerative employment for the labouring population.

It is unfortunate that Mr. COWEN should have indirectly countenanced the monstrous doctrine that force is no remedy for disorder. The opposite proposition is opportunely illustrated by the recent experience of the State of Pennsylvania. In that favoured country there are neither landlords nor English intruders; and in Schuylkill county an Irish community had until lately for five-and-twenty years uninterruptedly practised home rule on the

principles of the Land League. The population was organized under the title of the Molly Maguires which had been imported from the mother-country. Murder, torture, mutilation of animals, were as habitually practised as in the worst parts of Connaught; nor was innocence or harmlessness any protection to peaceable inhabitants, if they chanced to violate the decrees of the dominant jury of ruffians. The characteristic combination of anarchy and despotism could have scarcely been attributed even by a new-made English judge to the impulsive generosity which he supposes to have been perverted in Ireland by aristocratic oppression. The truth is that immunity from punishment ensures the continuance of crime; when it has once become habitual. Public opinion among the miners of Schuylkill was, as in Mayo or Sligo, wholly on the side of the ruffian majority. A less barbarous population might probably be tempted in similar circumstances to indulge with little restraint the passions of cupidity, of envy, and revenge. There may perhaps have been Democratic or Republican leaders who completed the analogy between the Molly Maguires and the Land League by encouraging crime for their own political purposes; but in most parts of the United States the real majority is on the side of order; and at last the condition of Schuylkill became intolerable to the State authorities. Mr. COWEN, President of the Reading Railroad, not only refused to submit to the dictation of the Irish conspirators, but he prosecuted their ringleaders with so much vigour and success that twenty-three offenders were hanged. Since that time peace and the supremacy of law have been established in Schuylkill. A less stern vindication of law and justice would have sufficed three months ago to prevent the creation of anarchy in Ireland. Mr. COWEN will probably find himself on this point in a small minority. Mr. CHITTY's speech at Oxford probably represents the average opinion of Liberal members; and even Mr. FAWCETT protested at Manchester against the reckless declarations of Mr. BRIGHT and Mr. CHAMBERLAIN. The language of Conservative speakers, especially if they are not in Parliament, has, for the present, less practical importance; but Mr. LOWTHER has removed a common misapprehension by publicly stating that, as Chief Secretary, he was charged by the Government with the conduct of a Bill for the continuance of the Peace Preservation Act. Mr. LOWTHER's denunciation of any interference with the rights of property in Ireland seems not to have been concerted with the leaders of his party.

EPPING FOREST.

SIR THOMAS NELSON has not allowed judgment in the Epping Forest case to go by default. In the *Standard* of Tuesday he undertakes to answer the strictures to which his advocacy of the proposed extension of the Great Eastern Railway to High Beech has exposed him. As regards some of these comments his reply is complete. It is a misfortune that controversies should ever be conducted in the spirit which has apparently animated certain defenders of what we still believe to be the public interest. Suggestions that the Conservators are neglecting their duty by allowing the Forest to be again absorbed by greedy speculators, or that the explanation of Sir THOMAS NELSON's support of the scheme is to be sought in "private ends rather than the public advantage," defeat their own purpose. If these charges were true, the task of those who seek to protect the Forest against the threatened invasion would be very much easier. What makes it difficult is the fact that the motives of those who support the projected railway and of those who oppose it are at bottom identical. The latter are contending, not against the subordination of public interests to private, but against a mistaken theory of public interests.

Sir THOMAS NELSON says, quite truly, that Epping Forest was preserved "for the recreation and enjoyment of the four million inhabitants of the metropolis." From this he draws the conclusion that "there cannot be too much facility given for getting to and enjoying it." This is true or false according to the sense in which the word "enjoying" is used. We contend that the enjoyment that ought to be aimed at is the enjoyment not only of as large a number of persons as possible, but also of as many various tastes as possible. If the four million inhabitants of London could be polled, it is quite possible that a majority of them would say that

the best way of making the Forest minister to their enjoyment would be to lay it out as a vast garden, with walks and drives cut through it in all directions, and seats and refreshment-rooms erected at short intervals. The objection to this method of dealing with the Forest is that it consults the pleasure of one class of persons only, and that, in order to give them more of a kind of enjoyment which they already have in considerable abundance, the pleasure of other classes is sacrificed. Among the four millions of Londoners for whom Sir THOMAS NELSON pleads, there are some to whom such a treatment of the Forest would be in the highest degree distasteful. They set a very high value on the "seclusion and solitude" which parts of the Forest have till now retained. It is not in the least a case of rich against poor. There is no reason why the poor should not be desirous on their rare holidays of leaving the sights and sounds of a great city for a moment behind them. In every class of the community there will be men and women who have the tastes of the naturalist, of the artist, even of the poet, strongly developed. The only chance they have of gratifying these tastes is an occasional day spent in the country, and nowhere can such a day be had so easily as in Epping Forest. There, if they do not mind a couple of miles' walk, and are not deterred by having to climb a hill, and possibly getting their feet wet, they can still find a country which is in a great measure unspoiled. When once they have left the main roads behind them, there is little fear of their being interrupted by the companions who have travelled with them in the train, and who have found equally congenial pleasures at a point very much nearer to the railway station. To these last the best parts of the Forest are still inaccessible. They do not care to wander so far afield. Sir THOMAS NELSON will no doubt object that in saying this we have really conceded all he asks. What is the good of preserving the Forest for the public, if it is suffered to remain inaccessible to the very public for which it has been preserved? The answer is that there is room enough in the Forest for all, and that it is bad policy to deprive the minority of a pleasure which cannot be replaced in order to give the majority more of a pleasure of which they already have a fair store. If the pleasures of the minority and those of the majority were really conflicting, if the minority could not retain the solitude and seclusion they now command in the Forest without depriving the majority of the pleasures which are involved in the idea of accessibility, there would be nothing more to be said. In dealing with public property the interest of the greater number has a paramount title to be considered. But, when the interest of the greater number has been considered, the minority may put in their claim. If it is possible to please them as well as the majority, that is a better arrangement than one which pleases only the majority.

As regards Epping Forest, the wants of the ordinary excursionist are amply supplied. He does not care to have seclusion or solitude; on the contrary, he prefers the cheerfulness and company which remind him of the "Welsh Harp" or the Alexandra Palace. Indeed, but for the cost of admission, he would probably prefer to go to one or other of these places; the merit of Epping Forest is not that he sees more of nature, but that he pays less for what he sees. The existing lines of railway give him all that he wants in the way of access to the Forest. If the new line is opened, he will do no more at the station at High Beech than he already does at the stations at Chingford or Loughton. He comes for a day in the country; but his theory of what constitutes a day in the country is an extremely modest one. If he is young, his ideal probably includes a skittle-ground, and perhaps a field in which he can play cricket. If he is old, a similar field serves for his children's games, and gives him a space in which he can saunter about and look on. If High Beech were the only part of the Forest where these simple enjoyments could be had, the extension of the railway thither might be a very proper stop. But, when High Beech is added to the list of places within reach of this type of visitor, he will have gained nothing; while the minority, who now visit it for other objects, will have lost all that made High Beech specially delightful. Indeed Sir THOMAS NELSON's argument might be urged with equal force as a plea for filling up the Serpentine. So much of Hyde Park and Kensington Gardens as is now covered with water is inaccessible to the majority of visitors. Only those who go down to the stream in boats can thoroughly

profit by it. If it were drained and filled up there would be a large additional space in which four millions of Londoners could stroll and sit. Sir THOMAS NELSON will be at no loss to point out the fallacy in this argument. He will say at once that the existence of the Serpentine gives a distinct and specific pleasure to the boating minority, while there is quite enough of dry land to give the non-boating majority all that they are in search of. The case of Epping Forest supplies an exact parallel. There is a particular part of the Forest which now yields a distinct and specific pleasure to the few who frequent it. The object of extending the railway to High Beech is to throw open this particular part of the Forest to a very much larger number of persons—not to share the pleasure of the few, but to enjoy a pleasure which will be fatal to that of the few, and which can already be had in quite sufficient abundance elsewhere. Sir THOMAS NELSON's motives in advocating this measure are most praiseworthy; but, in his desire to increase the existing facilities for getting to the Forest, he has unintentionally lost sight of the object for which these facilities exist. Every fresh road or railway does something to destroy the picturesqueness of the district through which it is carried; and when a district is specially reserved to the public on account of its picturesqueness, it is expedient, so soon as the rational wants of that public have been satisfied, that no more roads or railways should be made.

JEWS AND GERMANS.

THE coming in of the New Year was celebrated at Berlin in a way now and peculiar, but no doubt very gratifying to a large majority of those who witnessed it. The great anti-Semitic movement, as it is the fashion to call a craze for bullying the Jews, took the form of forcible measures against those Jews who, at a time of what is supposed to be general festivity, were venturing to drink beer in places of public resort. That Jews should presume to be happy, publicly happy, and should seek happiness in the consumption of something so sacredly German as beer, was too much for the irritable nerves of a number of fine young bloods whom the winter vacation has sent home from the Universities. They wrecked the cafés, and drove the beer-drinking Jews out of those polluted establishments. The Jews were, in short, suddenly "Boycotted," and told that, much as they might long for beer, no beer should be sold them. And, as if to make the parallel complete, and to show that another Limerick had risen on the banks of the Spree, we are told that the police were quite powerless, and had to fold their hands and look on helplessly while these outrages were perpetrated. Nor was the Executive Government in the least shocked by what had happened. It did not mind its police being powerless or harmless citizens assaulted. It calmly wrapped itself up in the thought that this was all part of the anti-Semitic movement. Meanwhile those who do not like using their fists use their pens, and add their signatures to a gigantic petition to Prince BISMARCK, in which he will be requested to do something very strong, if not very intelligible, to hurt the Jews. Oratory, of course, abounds; and solemn meetings are held, in which unflinching crowds listen to expressions of German hatred and expositions of Jewish crime. That Jews in some countries and on some occasions commit crimes is certain, for there was a striking number of Jewish names in the short list of those who recently tried to murder the Czar. It may, however, be remarked that there was also in this short list an equally striking number of German names. It is said also, although the evidence in support of the allegation for the most part broke down, that during the mania of German prosperity Jews figured as promoters of rotten Companies. Even if they did, they had shoals of respectable Germans to keep them company. Their real crime is that of having money and of having lent it. Their debtors hate them because they are their debtors. Times are bad, and those who are struggling with adversity hate those who want to realize their securities.

When once a slumbering dislike to the Jews as Jews is fanned into activity by such a cause as this, many antipathies combine to swell the volume of hate. They are foreigners, and most nations have a profound aversion to foreigners. And then they are not only

foreigners, but foreigners organized into a distinct body or clique, and organized bodies of foreigners are apt to be regarded with aversion and suspicion. Some of these cultivated beerhouse wreckers may probably have undergone a sufficient amount of the softening influences of a classical education to remember the horror with which Imperial Rome regarded the formation of any queer body of people into anything like a society. Then the Jews who have got into a thriving position disarrange German society, and disarrange it more than they would disarrange the society of a more advanced country. German society is still the society of those who belong to a poor and numerous aristocracy, and of those who are excluded from it. Such a society is sure to dislike and resist anything like purse-proud, coarse, or vulgar ostentation. Some allowance, too, must be made for the popular dislike of the look of the Jews. It may be a prejudice, but to the ordinary European their appearance is not attractive. Of course there are exceptions. There are Jews and Jewesses who are handsome, good, and modest; but the bulk of Jews do not win favour in the eyes of Europeans. Altogether, therefore, it is not very wonderful that the Germans should feel and manifest some dislike of the Jews. What is slightly wonderful is that the cultivated and liberal part of the nation should be so utterly unable to check this outburst of ill-feeling. And, what is still more wonderful, is that the Government should not do something to stop the violence to which the feeling now gives rise. That the police of Berlin should have to stand still in a state of bewildered helplessness while property is wrecked and persons assaulted under their eyes might have been thought to be a precedent on which Prince BISMARCK would not have looked with complacency.

It is said that Prince BISMARCK and other members of the Government have communicated with the EMPEROR on the subject of the impulse which a violent Court Preacher has given to this anti-Semitic movement, and have asked that his unseemly license of tongue should be checked. To this the EMPEROR is stated to have replied that the Court Preacher had committed no political offence, and that if he had committed an ecclesiastical offence, it was for the Church authorities to punish him. It is hardly possible to suppose that the story can be true in the form in which it is given. When Prince BISMARCK remonstrates, he is not apt to let his remonstrances pass unheeded; and the EMPEROR cannot have supposed so totally irrelevant an answer would have been good enough for any one, and least of all for his terrible CHANCELLOR. But the story may have just truth enough in it to indicate that this anti-Semitic movement is regarded, if not with approval, yet with much equanimity in very high quarters. The EMPEROR could do much to discountenance it, and Prince BISMARCK could snuff it out if he breathed on it the faintest breath of hearty disapproval. But neither the EMPEROR nor the PRINCE have any more to say about it than if it was a movement that was going on in Italy or Spain. It is not impossible to conjecture how this can happen. The EMPEROR in a very strong degree, and Prince BISMARCK in some degree, may share the feelings of the German aristocracy, and feel that their set is spoilt by the intrusion of rich Jews. Then Prince BISMARCK knows that Germans, and especially small German cultivators, are going through a bad time, and may both pity them and feel some anxiety as to the political consequences of their distress. He has had recourse to Protection to befriend them, and both he and they have found that Protection has not done them much good. But, if the Government cannot help them, the small Jew money-lenders can hurt them; and it may not be altogether inconvenient that popular indignation against these humble SHYLOCKS should absorb the attention of those who might otherwise ponder in a painful manner over the inability of the Government to make good the promises with which the introduction of Protection was accompanied. The German nature, too, must sometimes have its way, and if there is a coarse and harsh streak in this nature, Prince BISMARCK may think that it cannot always be concealed, and that, if any people are to suffer by its being revealed, it may as well be the Jews who are injured. The great aim of Prince BISMARCK's life is to strengthen and direct the national spirit, so that a new Germany may grow out of it, and the whole basis of this movement is that it is an exaltation of all that is specially German

and a degradation of all that is specially anti-German. If it has no other merit, this movement does at least swallow up particularism in an absorbing national sentiment. All that can be hoped is that before long Prince BISMARCK, whatever may have been his reasons for letting this movement have some play, will come to the conclusion that he and Germany have had enough of it.

CITIZEN BLANQUI.

THE record of a wasted life is never pleasant reading, and seldom has a life been more wasted than that of the veteran revolutionist who was buried on Wednesday. It certainly cannot be said of BLANQUI that he hid his talent in a napkin. He could do seemingly but one thing, but that one thing he was always doing. Each morning he called upon his faculties—soul, in his own opinion, he had none—to awake and run their daily course of conspiracy. Close upon half his life was actually spent in prison for political offences, and the larger part of the rest was passed either in preparing himself for a fresh sentence or in evading a sentence already passed. His political creed seems to have been precisely that of the Russian Nihilists. He had no desire to build up new institutions, and not impossibly was conscious of his own unfitness for such a work. But he held that the time for building up had not yet come. The only instrument he cared to wield was the besom of destruction. He revolted not against this government or that one, but against governments generally. Whether he thought that there were degrees of wickedness among them does not appear; what is certain is that he held every one of them to be too bad to be suffered to live a moment after it seemed possible to destroy it. He fought against the Monarchy which the Revolution of July pulled down, and against the Monarchy which the Revolution of July set up. More than half of LOUIS PHILIPPE's reign he was in prison, and he was only a free agent for about three months of the Republic of 1848. The Provisional Government was founded in February, and in March BLANQUI was organizing a demonstration against it. He repeated the experiment in April, and by May he had qualified himself for a fresh imprisonment. He was so little at large under the Empire that he had scarcely any opportunity of conspiring against it, though he saved his reputation by being condemned to death in August 1870, for an attempted seizure of arms. He liked the Government of National Defence no better than those which had gone before it, and played a prominent part in the insurrection of the 31st of October, 1870. If the Commune had had a little more success, he would no doubt have conspired against that. His theory was that all institutions being bad, right must always be on the side of the destroyer. "What exists," he told the Paris Correspondent of the *Times*, "is so bad that what is put in its place will always be better." His Nihilism however was less advanced in one way than the Russian form of the same views, since BLANQUI was content with the ordinary methods of dealing with the institutions he detested. In this respect he was a commonplace conspirator. His attempts to upset a government always took the old-fashioned shape of a popular rising.

The clemency of the Republic had of late been very injurious to his popularity. So long as he was excluded from the Amnesty, he was so far interesting to the people of Bordeaux that they were willing to return him as their deputy. His election was annulled, and the Government then took what proved to be effectual means to save themselves from having to annul it over again. They pardoned him. A pardoned conspirator is like yesterday's newspaper, and so the electors of Bordeaux thought. BLANQUI again asked their votes, but this time he was defeated. His last enterprise was the starting of a newspaper; but even in Paris there are certain conditions with which a newspaper must comply if it is to be prosperous. *Ni Dieu ni Maître* had the advantage of a most propitious title; but it must be presumed that the public which it addressed did not think its contents equal to its name, since, from being a daily, it has lately become a weekly, paper. Under the Commune M. BLANQUI was still more unlucky, for the paper he then edited came to an end altogether. Probably the gifts of writing himself and of finding those who could write were alike denied him, and the most advanced principles will not float a newspaper if they are not presented in a way that takes hold of the reader. Besides

this, the hoary head is not exactly a crown of glory when it is found in the way of revolution. The French Communists are like Oxford undergraduates; they prefer to be coached by a man who is himself fresh from the schools. BLANQUI came at last to be regarded as a respectable but superannuated professor—a man who had known something in his day, but had been superseded by later authorities.

The quiet which prevailed at his funeral will probably be used as an argument to prove that the extreme party in Paris has ceased to be in any way formidable. Whether or not this is a correct view we shall not attempt to say, but it is not evident how such a conclusion can be drawn from the proceedings of Wednesday. Funerals are ordinarily seized upon as occasions for political demonstrations when the Government is too firmly seated to be attacked in any more practical way. When it is not safe to make a political speech, it may be expedient to organize a huge procession by way of showing how many people there are who would have something to say if they were only free to say it. At present the Paris Communists are under no such restraint. They have abundance of occasions on which to tell the Government what they think of it, and they were consequently under no special inducement to march through the streets in the rear of BLANQUI's coffin. It was noticed that many of those who did attend the funeral were old men; and it may be inferred that such homage as was paid to BLANQUI's memory came rather from his own contemporaries than from that younger generation which makes the stuff of every revolution. Further than this, when the Government takes credit for the success with which the Communists are kept down, it becomes necessary to inquire in what sense the term is employed. Certainly there are no overt attempts at insurrection; and so far the Government can point to facts as constituting a tribute to its merits. But then it is impossible to give unreserved praise to an Executive for the resolution which it has displayed in not doing what there has been no opportunity for it to do. If we pass from action to speech, it cannot be said that the Communists have been suppressed. We give no opinion on the question whether it would have been wise or unwise to silence them. All that calls for notice is the fact that they are not silenced. The speeches at BLANQUI's grave seem to have been chiefly made up of praises of the Commune and predictions of its restoration; and this is equally the staple of nine-tenths of the political oratory which now delights the Parisian workman. It may, we repeat, be quite prudent in the Government to treat these utterances with contempt, but to treat with contempt is one thing and to suppress is another, and the terms ought not to be interchanged at pleasure. The policy of the Republic ever since the Amnesty has been to let the Commune alone; but, whatever other advantages may attend upon this policy, there seems no reason for crediting it with having made Communism harmless. The passions which prompted the worst outrages of May 1871 are as violent as ever, and only want a favourable conjunction of circumstances to burst out with all their old fierceness. No disproof of this conviction is furnished by the comparatively small attendance at BLANQUI's funeral. The Communists are too well acquainted with their own strength to be under any obligation to waste shoe-leather in a journey to a cemetery. Some years ago such a demonstration might have seemed to them necessary, because their very existence was then disputed. To-day nobody doubts that they exist; the only question is, to what use their existence is likely to be turned. They are naturally not anxious to enlighten the Government prematurely on this point, and, even if they were, they would probably find some other means of doing so than taking part in a purposeless procession.

THE EMPLOYERS' LIABILITY ACT.

IF any one was inclined to build any very great expectations upon the Employers' Liability Act, which came into operation last Saturday, he must by this time have had his hopes considerably dashed. The Act was not designed for a millennium, and it is evidently not calculated to bring about one. The best that can be said of it is that it puts the law on the right side of the hedge. Formerly the presumption was against a workman injured by the negligence of his master's agent; now the presumption is

in his favour. Formerly the plea of common employment was stretched so as to cover cases which had only been brought under it by an extreme exercise of judicial ingenuity; now the phrase is given its natural and proper meaning, and is made to cover only those cases in which the workmen concerned are really on an equality with one another, and the man who has been injured was in no way bound to obey the orders of the man who has injured him. No doubt the working classes wanted much more than this. They wanted to have employers made liable for acts which were in no way within their control as well as for acts which were within their control, and they would probably have liked—though upon this point the evidence is less clear—to have been prevented from contracting themselves out of the Act. As regards the first of these demands, the injustice to the employer was so patent that it was impossible for any Parliament to grant it. As regards the second, it would have been a very doubtful advantage to the workman to have deprived him of the right to make with his employer the agreement that it suits them both to make. It is probable, indeed, that there will be a good number of cases in which, from individual or trade circumstances, the master will be able to make the Act something very like a piece of waste paper. But in dealing with grown men the legislator is always confronted by this difficulty. If he provides for the exceptions in which freedom of contract is only nominal, and virtually frames the agreement himself, he does mischief in perhaps a far larger number of cases in which the men are able, either by their own strength or by the liberality of their employers, to make a much better contract for themselves than the legislator could have made for them. The case of the London and Brighton Railway Company, to which we referred the other day, was one of this latter kind. The terms offered by the employer were really better than those which the law would have given the men, supposing that they had remained under the Act. It would have been hard on the workmen if the law had refused to recognize the agreement thus freely entered into, and had insisted on making a less advantageous agreement for them. It may be said, perhaps, that the business of the law is to look after the weak, and that in consulting the interests of the workmen employed by the London and Brighton Railway Company, it was in effect looking after the strong. But if the law puts strong and weak on a level, how are the weak to become strong? A measure such as the Employers' Liability Act is really an intimation to working-men that they are able to do better things for themselves than the law can hope to do for them. Its provisions are simply designed to meet cases in which, from this or that cause, working-men are not able to do better, or even so good, things for themselves. The ideal arrangement is one such as the London and Brighton Railway Company has made. Where that is entered into the law gladly withdraws from the field. But what, it may be asked, is to be done with cases in which the workmen are so powerless as to be obliged to contract themselves out of the Act without receiving any corresponding benefits in return? When an employer offers to make a liberal contribution towards his workmen's insurance fund there may be a positive gain to the men in foregoing the rights which they can claim under the Act. But when an employer neither makes nor promises any such contribution, and still insists on the men contracting themselves out of the Act, is not this a case in which the law ought to interfere? What is the good of an Act of Parliament which can be made of no effect by a mere verbal intimation from an employer to his men that, if they choose to go on working for him, it must be on the understanding that they waive any compensation which the Act gives them? The only answer that can be given to this question is that Parliament has to deal with the working classes as a whole, that in the majority of cases they seem quite able to protect themselves, and that in the exceptional cases it is very doubtful whether it would be possible to give them efficient protection. Where the master from any cause is strong and the workmen weak, no Act of Parliament can do much to alter the relative position of the two. If legal ingenuity failed to invent some method of escape from the liabilities of the Act, the employer, if he were so minded, would probably find a way of holding himself harmless. He would lower wages, or lengthen hours, or devise some other expedient by which to reconquer himself for the additional payments he might conceivably have to make. A

employer will not have recourse to these methods because he will know that only an inferior type of workmen will conform to them. A steady workman will not assent to their use, because he knows that he can get employment from less hard masters. But where employers are short-sighted and workmen irregular or incompetent, it is hard to see how the law can interfere. It would be a very paternal Government indeed that undertook to make employment under a bad master as satisfactory as employment under a good one.

The best advice that can be given to working-men upon this subject is that, when they are invited to contract themselves out of the Act, they should consider very carefully the nature of the benefits held out to them by way of inducement to consent. As the Act was passed to give workmen additional security against negligence, it seems only reasonable that employers should increase their contributions to the men's insurance fund if these are to take the place of the statutory compensations. The Act has increased their liabilities, and it will usually be a mistake if they contract themselves out of the Act without making any alternative provision for taking these liabilities upon themselves. At least, if they do, they must not be surprised if their workmen think themselves hardly dealt with, and if this feeling leads them to agitate for more stringent legislation in the future. If no such offer is made on the part of the employers, the best course that the workmen can take is to wait and see what the Act will do for them. If the contribution offered by the masters comes anywhere near to the compensation which the statute would give them, it will probably be prudent for them to accept it. The chances of litigation and the risk of consequent ill-feeling between masters and men will thus be avoided. In calculating the relative advantages of compensation under the Act and compensation from an insurance fund, it will be necessary to remember that in the one case compensation is only paid for injuries caused by the negligence of the persons defined in the Act, whereas in the other case it is paid whether the injury be the result of accident or negligence, and whether the negligence be the negligence of persons defined in the Act or of any one else. The strength of a man's motive for contracting himself out of the Act will consequently vary in accordance with the particular conditions of each employment. Where the organization of a workshop is hierarchical—where, that is to say, the men are broken up into a number of groups of two and three each, under the orders of a workman little, if at all, superior to themselves—many more men will be able to claim compensation in the event of being injured than in a workshop in which the men are so many units under the command of a single foreman. It has already been discovered that, even if the men refuse to accept the offer of their employers, and are at the same time strong enough to refuse to contract themselves out of the Act, the employers have another alternative open to them. They can set up mutual insurance Societies which shall guarantee them against loss in the event of their having to pay compensation. It will, beyond doubt, be wise for every employer who is unwilling to remain subject to the Act to protect himself in this way rather than compel his workmen, supposing that he has accidentally the power to do so, to forego the benefits of the statute without receiving anything in return. Now that Parliament has recognized the responsibility of employers for injuries caused to their workmen by the negligence of their agents, a more repudiation of this responsibility will be regarded by the men as a defiance of the law—successful indeed for the moment, but to be more effectually prevented by and by. This is not an impression which it is desirable, in a democratic community, to leave on the minds of the working classes.

WINTER WILDFOWLING.

THE golden days of sportsmen of modest means are gone never to return. In the beginning of the century, in the time of single barrels and flint locks, a man could always find fair shooting if he cared to go far enough for it. North-country squires and Scotch lairds had any extent of "hill" which they could not possibly shoot over in person before the grouse had packed. Highland hospitality was proverbial, though perhaps there was some dash of selfishness in it. The occupant of a lonely residence in the moors was but too glad to welcome an intelligent stranger, who came with any kind of introduction, if he had pleasant manners and was a jovial companion. The keeper of any respect-

able inn or "change-house" could easily obtain "liberty" from his landlord for any gentleman who chanced to be sojourning within his gates. So Mrs. Meg Dodds of the Oleikum Inn obtained leave from old Mr. Mowbray of St. Ronan's for Francis Tyrrel and his brother to sport over the St. Ronan moors. Even the red deer were not very sharply looked after; and without any formal permission from a proprietor, it was quite possible to indulge in a "quiet stalk" by coming to an understanding with some poacher of the district. And the lives of these hill poachers, by the way, were another illustration of habits that are almost exploded. These men were the very reverse of the bloodthirsty collier who goes about in a gang with blackened face, netting the coverts wholesale as matter of business; or of the rascally loafer about the village public-house who snares the hares and shoots the pheasants in the trees. They were manly fellows who scorned anything but fair sport; who, by the help of the more legitimate pursuits they avowed, kept a comfortable roof over the heads of their households; and who, though notoriously addicted to the infringement of the Game-laws, had the respect nevertheless of both landlords and keepers. As for the kindred sport of rod-fishing, its devotees were even more highly favoured. To the north of the Border rivers, at all events, there was hardly any restriction anywhere on trout-fishing; the salmon in the Highland streams filled the pools in such excessive abundance that the wayfarer was made welcome to try his luck; while even in the choicest water in Tweed or Tay, it was but a question of some shillings for a boat and boatman. Everybody knows how all that has been changed. It is only the pet children of fortune who can afford to pay fancy prices for forest, moor, or famous salmon water; and even the practice of extending sporting hospitality to those who have the strongest moral claims upon it has been very perceptibly on the decline. Gentlemen drive their grouse moors after the beginning of the season, as they walk their stubble and shoot their coverts, on well-understood principles of reciprocity. A man is invited to a drive or a battue to-day, because he can send an answering invitation to-morrow; or crack shots are retained for the sake of their skill, when cleanly-killed game is to be forwarded to the market. So it is that the penniless younger brothers and cousins out-at-elbows who used formerly to have the run of the family manors begin to find themselves left out in the cold; and even should their adventurous spirit tempt them further afield, they are brought face to face again with pecuniary considerations. The Scandinavian rivers, like the Scotch streams, have passed into the hands of millionaires; the buffalo and bison have disappeared from those happy hunting-grounds which extended half a generation ago to the very banks of the Mississippi and Missouri; even in South Africa, to penetrate to the retreats of elephant and rhinoceros, you must find the capital for a costly expedition, and seek your profits in trade or the sale of your ivory. In short, in the scramble after shootings, as in everything else, the battle is to the rich and the race to the fortunate; and, so far as we know, there is but a single resource left to the poverty-stricken sportsmen who are tethered to England.

That resource is wildfowl-shooting, and while its pleasures must be considered undeniable, there can be as little question as to its drawbacks. We say its pleasures are undeniable, for no sporting pursuit makes more enthusiasts; and, indeed, none but an enthusiast can possibly enjoy it. It is at its best in the very depth of the winter; and the wildfowler prays for the severity of weather which chills him to the marrow, while it brings the wildfowl to our shores. But there is constant excitement in its incidents and chances, as in the various contents of most miscellaneous bags; and, besides, it need cost but little, beyond board, travelling, and ammunition, with an occasional tip to a bag-carrier or boatman. The habitual wildfowler has his regular houses of resort, where he has learned to make himself thoroughly at home, and can rely on his likings and fancies being studied. Probably he puts up at a modest inn in some secluded village in the Eastern marshes, or in an antiquated hotel in some old-fashioned town, that has been left high and dry by the reflux of the sea, as by the consequent ebb of life and traffic. It is a puzzle how these places are made to pay: yet, considering all things, the internal comforts are often marvellous, and you find at least that they have their regular local *clientèle*. In your own interest, however, you will do well to intimate your arrival in advance, otherwise the larder may be disagreeably bare. But, with due notice, the table will be substantially spread, and frequently the *cuisine* is far from contemptible. There is sound ale in the cellar, with unimpeachable spirits; and the beds are luxurious enough in all conscience for a man who has been weatherbeaten through a winter day. It is liberty hall so far as tobacco is concerned; and your shaggy water-dog, though he may come in coated with mud, has the run of the establishment from parlour to kitchen. The odds are that the landlord is himself an old fowler, and treats his sporting guests with a cordiality that is almost effusive. Notwithstanding that, he knows his place, and you will find his company both pleasant and profitable when he accepts an after-dinner cigar, and draws his chair towards the fireplace. He can give you many a hint as to the flights of birds that are on the coast, and is far more trustworthy than his venerable barometer in making a forecast of the weather for the morrow.

That evening chat is very agreeable, as you sit contemplating the glowing coals through a cloud of fragrant tobacco, listening perhaps to the wind howling without, and dashing the sleet or the hail against the lozenge window-panes. To be sure there is always

the reflection that, unless the wind falls and the weather "holds up," it will be idle to trouble the boots to call you early. What you ask for is a long stretch of hard frost, that will drive the birds to the creeks filled with salt water, and to the mud-banks that have been saturated with the rise of the tide. Of course a suitable equipment claims your first care, for you will have to face severe work at best, and must lay your account with much passive endurance, not to speak of some positive suffering. The dead weight you are bound to drag about is heavy. The bore of your gun may be matter of taste; in any case the weapon must be a formidable piece of ordnance. It is no joke carrying your own ammunition, for the supply should be ample in case of good luck, since nothing can be more heart-breaking than finding the cartridges give out while you are still in the swing of excellent shooting. Wading-boots are necessarily cumbersome, yet sooner or later, by some inevitable mischance in your excitement, you are pretty sure to come by an immersion over the middle, when, if unprepared, you will be water-logged from mid-thigh downward. So it is wiser perhaps to set a wetting at defiance from the beginning, though then the feet become pitifully chill and numb, while they will cling besides to the yielding mud with a painful and most perverse power of suction. As you labour along with more or less of perpetual effort, the upper part of your body is pretty sure to be warm enough, if not too warm. Should you care for a cooling way of relief, it is very unlikely that you will have to wait long for it. Keeping a watchful eye on the bends of the shore and the sky line, carefully scanning each tiny island and mud flat, as they are slowly left by the receding waves, you mark some flock of waders that needs cautious stalking. As you worm yourself forward in your slow advance, you must crouch down or lie still from time to time, if you are to elude their quick observation. Then there is a swift fall in your bodily temperature, as when a flask of wine is dipped into an ice pail; or the wind cuts through your woollens with the keen edge of a razor. Or possibly, by a stumble, or in attempting a jump, you precipitate the immersion of which we have already spoken, when you will be lucky if you save your gun and cartridges from consequences which may seriously interfere with your sport. As we need hardly add, it is devoutly to be hoped that you have no constitutional tendencies to rheumatism, though, for the matter of that, most wildfowlers past middle age are likely to be inoculated with the complaint. As for coughs and colds, and such trivialities, they will come in the natural course of things; though your landlord will tell you that they may be treated successfully by repeated applications in the evening to the spirit case.

It will be seen that among the essentials of the winter shooter's outfit, with enthusiasm he ought to possess a sound constitution; and if, in addition to good spirits, he be a warm-blooded animal, naturally it is all the better for him. Then there are many days when he feels himself abundantly rewarded for the cold and exposure he has continually to endure, with the disappointments his precarious pursuit will reserve for him. Incident may crowd fast upon incident, and there may always be surprises or sensations in store. He drives, we will say, to his shooting grounds, and we fancy him getting out of his dogcart and wrappings in the dim light of the breaking morning. The lights of the rising sun are faintly streaking the eastern horizon between the blushing greys of the sea and skies, as he steps out upon the sands. The sound of the dogcart wheels has hardly died away in the distance, when there is a faint whistling of wings overhead. He half-crouches instinctively, while his dog imitates the action, and next there is a circling flight of phantom-like forms distinguishable between him and the dawn. Bang—bang—go both barrels, and some of the birds are dimly seen to fall. Next moment, the dog is eagerly questing after the slaughtered plover, or plunging into the water in the nearest creek, in pursuit of one or two of the fluttering cripples. Confidence comes to the sportsman with so good a beginning, and he is likely to shoot all the straighter afterwards. His next encounter is with a little flock of waders—sandpipers, greenshanks, or ox-birds, taken by surprise in the middle of their early breakfast on a mud-bank. Walking along by the side of an embankment, from the tints of which his shooting-suit is scarcely to be distinguished, he hears the shrill whistle of the curlew, which, notwithstanding their natural shyness, come drifting by within easy gunshot. Or it is a heron solemnly floating in the air, which is seen slowly to fold its stately pinions and drop gracefully into some neighbouring pool. Sooner or later, he has a chance at a mallard flying fast and straight ahead, unlike the unpurposelike curlew or plover, as if it knew precisely the point at which it was aiming. This is not an easy bird to hit, and is still more difficult to kill; but the heavy choke-bore carries hard and strong, and down comes the mallard, pitching far ahead, as it is borne forward by its tremendous impetus. So the day's shooting goes on, while hits alternate with misses, till the shades of evening begin to close in, or the waters of the mounting tide overflow the weed-strewn shores. Then our friend remembers that he is wet and cold, and exceedingly hungry into the bargain; and as the darkness shuts out the landscape from his view, dry clothes, a dinner-table, and a blazing fire come agreeably before his mind's eye.

FEUDALISM AND CONTRACT.

THE present state of England is, it is well known, extremely satisfactory. It is not long since Mr. Baxter informed us that it was impossible to have a more high-toned Parliament than the present, and though it might have been better had the member for Mont-

rose been able to express the merits of his colleagues at St. Stephen's in the English instead of in the American language, it is still obvious that he intended a compliment. Since Mr. Gladstone discovered that for political wisdom it is only necessary to look to Little Pedlington and to disregard carefully the opinion of the capital, a short method of taking the political sense of the country has been obvious, and has been largely practised by his followers. Thanks to this, and to the unanimity with which the oracles, naturally grateful to their discoverer, speak in his praise, it is ascertained that the constituencies are still as high-toned as the Parliament. All, therefore, ought to be well, if it is not. Unfortunately, there are still a certain number of low-toned persons who cannot help looking at things as they are, with the assistance only of the glasses lent by history and by common sense, instead of regarding them through a pair of spectacles which enable the wearers to see nothing but the large Liberal majority and the utterances of the Little Pedlington Chronicle. To these discontented outsiders the high-toned waiters upon Providence are not a lovely sight, and their ideas—or what does duty with them for ideas—on a great many subjects are still less lovely. In no instance is this more the case than in reference to Ireland. The Session has begun, Parliament is called upon to face a state of things which is certainly as serious as any that the present generation has known, and the minds of at least a large number of the high-toned representatives of the people, and of their high-toned constituents, appear to be in a complete fog as to Ireland, Irish demands, Irish requirements, and Irish probabilities. The happy recipe of "coercion + concession," a little powder and a little jam, sums up what they have to say of a practical kind; while in the way of reasons they have nothing to offer but remarks about the Irish landlord and the Irish tenant being partners in the land, up-braidings of the former for hard dealings, and the like. At one time the relation of landlord and tenant is cried down as feudal; at another the pushing of the doctrine of contract to its extreme is denounced. But that these outcries are inconsistent, and, what is more, that both hopelessly ignore the facts of the case and the real interests both of England and Ireland, this no one sees, or, at any rate, no one pretends to see, among the active members of Parliament who pack up their carpet-bags every ten days or so, and go down to Little Pedlington to confabulate with the independent electors and enjoy a crow over the local squire to whom they have been preferred.

That the relation of landlord and tenant, if it exists at all, must either rest on what is vaguely called feudalism or else on strict business contract is, one would think, sufficiently obvious. Of the older and perhaps better kind of relation nothing could possibly give a clearer idea than the remarkable interview which took place the other day between Colonel King-Harman and his tenants. Not very long ago there was not in Ireland a more popular man than Colonel King-Harman, and the description of his own conduct which he gave at this interview, and which was endorsed by the cheers of the very men who were being instigated by the Land League to rob him of his rent, sufficiently explains his popularity. Colonel King-Harman has an immense estate which is almost entirely in the hands of a very poor tenantry, occupying very small holdings. The total rent of the estate is some ten per cent. under Griffith's valuation. In bad years the landlord—not content with reductions which in such cases are a farce—simply forgives the rent altogether; he never distrains or evicts. He gives employment and supplies seed gratis; he advances (to use the polite term) money for the purchase of stock, &c., and does not press for repayment. All these things Colonel King-Harman said publicly to the victims—that is probably the best word for them—of the Land League, and of five hundred hearers not one contradicted him, but, on the contrary, all agreed that he spoke the exact truth. Now, we are not going to argue that this state of things is an ideal state of things. It probably tempts a people who require only too little tempting to be wasteful, to have no self-reliance, to be careless about doing their utmost. But, such as it is, it is a pretty complete carrying out of the feudal or fatherly relation of landlord and tenant, and there are doubtless scores and hundreds of similar cases in Ireland. How do our wisacres propose to meet this? By substituting for it a relation which will not improve the case of the tenants, for, supposing their rents reduced, they will have to pay them *bon an mal an*, and cannot look for time or reduction; by giving them fixity which they already possess; and by conferring free sale on them—that is to say, by encouraging them to pay for an imaginary goodwill the small capital which ought to go to cultivation. So much for feudalism. Because landlords are not considerate enough towards their tenants, it is to be made practically impossible for them to be considerate at all.

But now let us look at the other side. Mr. Bence Jones is probably as good a specimen of the type of landlord who looks at things from the point of view of pure contract as Colonel King-Harman is of the landlord who looks at his tenantry as a "tail" of which he is the chief. Putting idle, and in many cases disapproved, stories of harshness aside, there can be no doubt that the master of Lisvelan has for many years worked his estate on strictly business principles. He has been lavish of money for its improvement. He has expected to get his money's worth for the capital spent, and he has, though not without proper consideration for vested interests, maintained his right to get the best men to work under him in the place of worse men. How greatly he has improved the food-producing power of his lands, the *morale* of his tenantry—in short, the physical and social well-being generally of the portion of the country of which he is in charge—the facts, well

and undisputed, show. Well, then, what have our wisacres to propose in this case? They would, in the first place, mulet Mr. Jones of a very heavy sum—in his case, and with such an estate and tenantry as his, it would be a very heavy one—representing the value of the tenant-right they wish to concede. They would render it impossible for him any longer to work his land by the best men. They would probably reduce his annual income considerably, and by their principle of free sale would, as in the other case, cripple the future tenants. That is to say, Mr. Bence Jones is, on the principles which they advocate—if they advocate any principles at all—to be fined a lump sum and an annuity besides, and the value of his estate to the whole country as a food-producing machine is to be seriously lessened and imperilled. And why? Because it is said, openly or covertly, that he has not been sufficiently sentimental in his dealings with a people of such delicate sentiment as the Irish. Colonel King-Harman is to be despoiled because he has been too sentimental; Mr. Bence Jones because he has not been sentimental enough. Feudalism? It is an abomination, and ought to be reduced to the simple principles of business. Contract? It is a terrible mistake to think that contract should overrule the “ineradicable belief of the Irish peasant that he is part owner of the land.” So the frying-pan and the fire are both ready, and the landlord is amiably permitted to take his choice.

It is probable that a very small minority of the people who are guilty of this disastrous blundering have something like a solid idea at the bottom of the muddled reasoning which fills their minds. Either they wish to get rid of landlords at any price, or they wish to establish peasant proprietors at any price. The muddle into which the late Mr. J. S. Mill has led so many thousands of guileless persons on the latter subject is no doubt responsible for a good deal of the present confusion. No one, of course, denies that a peasant proprietary is an excellent thing if it can be managed. But every one who has really looked into the question knows that it requires either such exceptional economic and physical conditions as those which prevail in the Channel Islands and Belgium, or such exceptional moral and physical conditions as prevail in France. That neither of these combinations exists, or is likely to exist, in Ireland is certain, and can only be denied by those who set up “Our party, right or wrong,” as their criterion of opinion. This being the case landlordism becomes a necessity, and landlordism implies the acceptance either of the relation of feudalism or of the relation of contract. Both involve some dangers and some hardships. Here and there a landlord who neglects his duty may bring discredit on men of the type of Colonel King-Harman. Here and there—and probably in a good many cases—giving the principle of supply and demand which practically governs contracts free swing may result in compulsory expatriation and other hardships. But both systems, if fairly worked, make the existence of the people possible and tolerable, the latter by the application of a stern, but in the long run merciful, weeding out of all but the fittest, the former by providing all over the country men with means who are bound by an unwritten law to come to the succour of the unfit. In the former case, no benefit society is required; in the latter, the landlord is a kind of embodied benefit society, subscribed to by the tenants in good years, drawn on by them in bad. But for the last ten years, under the guidance of our wisacres, we have set ourselves to work to render both these systems impotent for good while we leave them potent for evil. The legislation of 1870, and still more that which is threatened or promised for 1881, have at once straitened the landlord's means and lessened his inclination for benevolence. They have at the same time interfered with the natural operation of the contract system, have given the unfittest the best chance, have promoted over-multiplication of population, over-division of holdings, misappropriation of the capital necessary for cultivation, and every other evil most abhorrent to a sound economic theory of agricultural prosperity. The legislation with which Mr. Gladstone's name is identified hitherto—and, as far as can be judged, that with which he will shortly seek again to identify his name—deals one slap in the face to Colonel King-Harman and another to Mr. Bence Jones. It says to the one “You shall not have the means to support your tenantry in comparative idleness,” it says to the other “We will deprive you of the power of keeping up your tenantry to constant work.” Meanwhile the forces of nature acting on the treeless, mineless sponge called Ireland, ensure poverty and misery for small cultivators, unless they suddenly change their nature, and probably even then. The condition of Ireland, as it actually is, is starvation tempered by landlordism. Its condition as it might be would be starvation rendered impossible by the operation of contract in keeping the population down and getting the utmost out of the land. We are going apparently to choke off the landlord cheek with one hand and the contract cheek with the other. Mr. Gladstone and his colleagues may be at least congratulated on their careful observation of the dictum of the Scriptures that “The poor ye have always with you.” They have taken, and are taking, care that the poor shall never cease out of the land of Ireland. What other results their past and future legislation may have we need not inquire; but, if the future goes on the lines of the past, it is safe to prophesy that it will mean a new Mansion House Relief Fund, a new Land League, and a new agrarian law every decade or thereabouts.

PULPIT PENCILLINGS IN THE P. M. G.

THE *Pall Mall Gazette* is to be congratulated on the return of a very old and always welcome contributor, the “Red Rover,” in fact, to its friendly columns. The early and chequered history of the *Pall Mall Gazette* is recorded in *Pendennis* and the *New-comer*. The tale should be familiar to all; but there may be some who have forgotten that the “Red Rover,” playfully so called by his friends, was Mr. Frederick Bayham to all Europe. It was Mr. Bayham who invented that fresh “feature” (as newspaper people say), the “Pulpit Pencillings,” which, after a considerable lapse of time, again appear in the Monday numbers of the *Pall Mall Gazette*. They were originally “slight sketches, mental and corporeal, of our chief divines now in London”; but Mr. Bayham has dropped the “corporeal” illustrations and the signature of “Laud Latimer.” It will be remembered that Mr. Bayham thought that these sketches “give the paper a character, they rally round it the respectable classes”—a very desirable thing to do. Scoffers, of course, there were in the old time who called Mr. Bayham “the Venerable Headle,” and the race of cynics is not yet extinct. People will smile at pulpit pencillings of Dr. Congreve, of Mr. Spurgeon, and of Mr. Bradlaugh in the secular pulpit, though perhaps neither Dr. Congreve nor Mr. Bradlaugh can, strictly speaking, be numbered among “our chief divines.” We have not observed that these latter pencillings have yet been given to the world and the respectable classes. But the æsthetic classes had their innings on Monday, and, to use Mr. Bayham's own words, “I own that I have puffed your uncle, Charles Honeyman, most tremendously.” The divine portrayed last Monday was, in fact, Mr. Stopford Brooke at Lady Whitteless's—we mean, of course, at Bedford Chapel. In detecting a subtle resemblance between Mr. Charles Honeyman and Mr. Stopford Brooke we are moved, of course, only by the public performances of these divines. Both were popular preachers, more or less unattached, both had congregations consisting of “the ornamental classes,” more or less attached, and both “preach short stirring discourses on the topics of the day.” There is another point of resemblance. Mr. Stopford Brooke, if we may trust the *Pall Mall* “pencil” which we have been lingering over, has justified the words applied by Sherrick to Mr. Honeyman—“How he's come out, hasn't he? Didn't think he had it in him.” Before Mr. Brooke “came out” of the Church of England, we suspected he “had it in him” to preach as he has been doing, but we could not conjecture that he would ever give “it” utterance. But let us turn to Mr. Bayham's graphic pencillings, and see what “it” is.

“Since Bedford Chapel became a Unitarian meeting-house,” writes Mr. Bayham in the *Pall Mall Gazette*, “its pastor has been engaged in defining, in a series of characteristic discourses, his latest views concerning the Founder of the Christian faith.” It is always well to have Mr. Stopford Brooke's very latest views, because they differ so wonderfully from the views which, it is charitable to suppose, were his some three months ago, the views of the Church of which he was a minister. Therefore it was quite worth Mr. Bayham's while to “struggle through the dense yellow fog which overhung London,” and emerge into the sweetness and light which now pervade Bedford Chapel. The Chapel, we read, was “tastefully decorated,” as a chapel ought to be at the season of the birth of the Being whom Mr. Brooke calls “the Pilgrim of Eternity.” Mr. Brooke has edited, or selected, or performed some similar kind of office for Shelley, and he probably knows that, by “the Pilgrim of Eternity,” Shelley meant, not the Founder of Christianity, but Childe Harold. Most people have noticed the readiness with which uneducated preachers catch at any Scriptural quotation; for example, we have heard an illiterate divine describe eternal punishment as “exceeding abundant, above all that we can ask or think.” Mr. Brooke lugs in scraps of Shelley in the same fashion, and “tastefully decorates his chapel” in honour, shall we say, of Childe Harold. Talking of “tasteful decorations,” we learn from Mr. Bayham that, in Mr. Brooke's, as in Mr. Honeyman's, chapel, “they dress the part, sir, to admiration,” or, in the words of last Monday's pencil, “the surpliced choir remain, and the Psalms are chanted as of old.” But this is enough about the decorations. We only regret to hear that the high-backed pews are uncomfortable. This should be looked to at once.

We now come to Mr. Brooke's discourse. Mr. Frederic Harrison must pardon us if we venture to make some remarks on a discourse which we have not heard, and of which only a partial newspaper report is before us. What is the use of the “pulpit pencillings” if we cannot rely on the accuracy of Mr. Fred. Bayham? What are the respectable classes to do if these sketches of our chief divines prove less than infallible? Mr. Brooke, then, began by talking about “the cradle of the New Year,” and, like most of us, he “wondered what the future would bring,” and lamented that the loss of youth should so often involve the loss of hope, “of the poetry, the music, and the romance of life.” We grow less romantic as we grow older, certainly, and a very good thing too, most of us will say. Sophocles consoled himself readily when he escaped from his wild masters, the passions. It is something to escape from what Mr. Brooke called “the romantic heart,” and the scrapes into which the romantic heart is always urging the sentimentalist. Different frames of mind bask in different ages, and middle age is ill assorted with romance. Mr. Brooke does not seem to think so, and observes that we, like the Founder of Christianity, should “keep the romantic heart.” And this statement is the keynote of the whole discourse of this divine.

Whether the respectable classes like it and rally round it or not, we do not care to reproduce Mr. Stopford Brooke's medley of solemn and consecrated names with the latest æsthetic slang. In Mr. Brooke's sermon we have Buddha, and Elijah, and the Pilgrim of Eternity, and the romantic heart, and the Greek idea of beauty, and dwelling in tents, all muddled together, like a discourse of Prigby's or Postlethwaite's mixed up with a sermon of Canon Farrar's. Till we read the "pulpit perfilling" in which these things are recorded we had scarcely believed in the existence of the ideas ascribed by Mr. Du Maurier to his group of artistic nincompoops. But the sacred subject of Mr. Brooke's discourse is represented as very much akin to the men of that set:—"His life must itself have been Art to awaken Art . . . Religion was first holy, but afterwards it was beautiful; it was Romance." "This merriment of parsons is mighty offensive," said Dr. Johnson. This æsthetic priggishness of preachers is not more, but less attractive, than the merriment which disgusted the good Doctor.

If we were to take these utterances seriously, we might dilate on the absurdity of making the sense of beauty the centre and the mainspring of a religion. The "beauty of holiness" is an intelligible idea familiar to Plato. The holiness of beauty is quite another thing. It is a stale historical truism that a gushing devotion to Beauty has never regenerated, but has frequently corrupted, society. We need not go back to the examples of Athens and of Rome during the Revival of Letters. The morbid symptoms which accompany an exclusive devotion to beauty have been noticeable enough in England during the last ten years. They have not gone further, perhaps, than an affectation of effeminacy; but they do not deserve encouragement from the pulpit. Mr. Brooke's very "latest views concerning the Founder of the Christian Faith" include, of course, a great deal that is sounder than the talk about the "romantic heart" and religion that guins much by becoming romance. But talk of this sort is nothing but the adaptation of slipshod literary slang, the slang of a small and ridiculous set, to topics which demand the utmost gravity and self-restraint. The vacant chaff of long-haired wittlings is already irritating enough. Sermons like Mr. Brooke's may encourage them to mix Christianity up with what they take for art in a manner from which, so far, they have shrunk. The young men and women of culture have, till now, been like Baudelaire's acquaintance, who "carried a toast to the God Pan," and who declared that "the God Pan was the Revolution." This absurd mixture of Pagan and political *argot* was less annoying, we think, than Mr. Brooke's mixture of "Culture" (in the worst sense of the word) and Christianity. The paganism of the artistic has so far been the error of people who have read translations of Heine too much. The neo-Christianity of romance will be the error of sweet enthusiasts who have listened too eagerly to Mr. Stopford Brooke. The fault of both sects, neo-Christian and neo-Pagan, is to drag in art where art has nothing to do with the more serious matters in hand. "The passionate frenzy for the beautiful is a cancer that devours all the rest of a man's moral nature," says Baudelaire, a strange Puritan adversary of gushing divines. Again, "the supremacy of art in a man's soul begets stupidity, hardness of heart, egotism, and an immense self-conceit."

This chattering enthusiasm about art and romance had a considerable excuse in ages that were either artistic or romantic. In the time of Michael Angelo, in the time of Phidias, even in the youth of Victor Hugo, the world was romantic and produced an abundance of works of art. Now, where is the art? Are our painters and our sculptors so eminent, are our poets so prolific and accomplished? Nothing of the sort. We have some three or four great painters and poets in England. The rest are students, enthusiasts, people who make experiments. "We have been on many thousand lines," as Mr. Matthew Arnold says, but the line of art is strewn with crushed and telescoped remains of our failures. This is the irritating thing. Our art is all in "words words," in essays, and talk, and chaff, and sermons like that of Mr. Brooke, about religion swooning into romance, and about the "Pilgrim of Eternity." When we get outside of these things we have the Temple Bar memorial, and the Byron statue, to comfort and strengthen us on the paths of daily life; we have Mr. Brooke talking of that "magnificent poem of imaginative symbolism," the Apocalypse, just as another enthusiast spoke of "that tremendous creature, Dante." We need a Latimer to counteract the influence of a Honeyman.

THE RECRUDESCENCE OF FENIANISM.

DIFFERENT persons, according as their nature is charitable or malicious, may assign different reasons for the increased vigour, or rather the decreased inertia, of Her Majesty's Government in its Irish policy during the last few days. The imminence of Parliament, the feeling that serious internal dissensions in their party might result from continued obstinacy and blindness, the sense that the noisier speakers among their supporters do not represent the opinion of the nation any more than of their more silent colleagues, may all have had their effect. But perhaps it is not wrong to trace part, at least, of this revival of activity to the alarming rumours—founded, it is well known, on tolerably definite information furnished to the War and Home Offices—as to a renewal of the attempts on arsenals and warlike stores

which marked the last Fenian effervescence a dozen years ago. No Ombudsman is wholly composed of fools; and only a body wholly composed of fools could fail to perceive that certain circumstances would very rapidly alter the passive dislike with which a large portion of their supporters have hitherto regarded their action, or want of action, in Ireland, into a very active feeling of discontent and something more. So long as the discomforts of the Irish anarchy were confined to Ireland, the average Englishman, who is, it is to be feared, sometimes a person of not very lively imagination, and often one of very considerable selfishness, did not trouble himself very much about them. Ministers told him that on the whole outrages had rather diminished than otherwise, the Radical members for his borough repeated the cry, and he was, if not exactly satisfied, at any rate pacified. Even such striking and pathetic cases as that which occurred the other day at the Lambeth Police Court, where it appeared, after full inquiry, that a father and mother, persons of good position in Ireland, had, owing to the refusal of rents, been living on the sale of their clothes and jewellery for months past, and had been obliged to send their son to a Board school because they could not pay for his schooling elsewhere—produce little effect save on a few readers whose indignation is probably awakened sufficiently already. The shoe must really pinch before the average Briton determines to have it altered or to throw it away. In the last few days it has begun to pinch very acutely. The Sheffield and Solihull murders created an uncomfortable impression, but in both cases Irishmen only were the victims, and persons who did not claim descent from Brian Boru, or Malachi with the Collar of Gold, might hug themselves in the belief that they were safe. It is different now, and something like a very vivid remembrance of the Clerkenwell explosion and the Chester raid must have forced itself on many thousands of memories.

At present the most effective, though perhaps the least practical, scare of the last Fenian terror does not seem to have been revived. Terrified householders who live in the neighbourhood of gasworks have not yet taken to deserting their houses. Incendiarism of another kind, however, has already made its appearance at Liverpool. In the early part of the present week several timber yards in the docks of that town were found to be on fire, under circumstances which left no doubt of there having been wilful "fire-raising" in the case, and a ship was also discovered in flames without any explanation being forthcoming. Perhaps these things were accidental. What, however, is assuredly not accidental is the existence of a plan, more or less extensive, for attacking Volunteer armories and other repositories of arms. For a week past one of the Surrey regiments, whose headquarters are at Camberwell, has, in consequence of orders from the War Office, had its headquarters guarded by a picket of men and officers with loaded rifles. Another corps in the same neighbourhood, mustering some seven hundred men, and therefore offering a tempting supply of arms, had to station a guard on Monday night at its drill sheds, and next day had its rifles unscrewed, and thus rendered useless, as a matter of precaution. The Liverpool corps have been recommended by their commanding officers to remove each man his rifle to his own home; the powder magazines are guarded; the Army Reserve pensioners have been warned that their services may be required, and everything is in readiness. Not merely round London, but in the neighbourhood of nearly all the large towns, there are rifle ranges in more or less lonely situations where stocks of ammunition are usually kept. These have been removed and stowed where they can be more easily guarded. In some of the smaller country towns where no safe place is available, the stores have been transferred to the nearest military depot, and in one case the arms of a Volunteer regiment have been stowed for safety in the barracks of the regulars. These measures of precaution are believed to have been taken in consequence of intelligence to the effect that ill-wishers were aware of the practice of suspending the regular drills during the Christmas holidays, so that the armories and drill sheds would be comparatively deserted. Sunderland, a town containing no small number of Irishmen, furnished the first suspicious case; but it is understood that very many other places are or were threatened. We are told, and we have not the least doubt of it, that the Volunteers have responded most cheerfully to the call, and that any number of men for night patrol might be had if wanted. There is fortunately not the slightest fear of any lack of forwardness on the part of either men or officers, and though just at this time of year more cheerful occupations can be imagined than pacing up and down in front of a drill-shed to protect it from skulking ruffians who are quite certain not to show fight, while they may be equally certain to take advantage of any carelessness, it is no bad initiation in something like real work for citizen soldiers.

This, however, hardly exhausts the aspects of the matter. The Volunteers may be quite willing to do duty of this kind, and it may be a very good thing for them to have to do it; but it strikes us as a somewhat pertinent inquiry whether the Government of the country does not count for something in the matter. No one, except Mr. Gladstone, his Ministers, and his devoted admirers, could fail to see that the result of his long tolerance, not to say encouragement, of the Land League must be a recrudescence of Fenianism. Although not too much is known of the I. R. B. nowadays, it is sufficiently certain that its organization has for some time been making up its leeway, and that it is now better prepared than it has been since the collapse of the last grand attempt. It was also perfectly obvious that such a state

of things as the Land League has been for months steadily bringing about in Ireland most conducive to the feeding and fattening of the more secret and more openly treasonable Association. Men do not stop at ease when they begin quarrelling with law; and after Mr. Parnell's very outspoken utterances as to the ultimate object with which he himself "took his coat off" it is sufficiently clear that those who go a little further than Mr. Parnell goes, or professes to go, must have stripped for their ultimate object as well as for the relatively paltry task of robbing a few landlords. But the main thing is that the peculiar spirit of violence and lawlessness which the Land League has encouraged is certain to crave for a bolder and more daring policy than any presented by fetish worship of Griffith's valuation, and by the unexciting, because comparatively passive, process of boycotting. It is now matter of notoriety that in Galway and Mayo—the model districts of Land League organisation—the only way to avoid sanguinary conflicts is not to cross the popular will in any way whatever, and in one or two instances during the last day or two, when the police have shown a bolder front, serious encounters have actually taken place. Nothing else can be expected, and Land League meetings glide as naturally into Fenian conspiracies as any one thing can possibly glide into another. Nor, abundant as the supply of arms at present is in Ireland, is it such as to satisfy those who desire to set on foot a regular military organization. The good friends of the Irish edition among the constituents of Messrs. Bright and Chamberlain have, it is sufficiently well known, driven an active trade with Ireland of late. But Birmingham gives nothing for nothing, and only a fair trade return for the consideration received. Purchasing really good arms at that model town is therefore expensive. The cast-off Enfields and Sniders with which the mistaken economy of more than one Government has flooded the island are all, very well for making a show by moonlight, for intimidating landlords and rent-paying farmers, and so forth, but they are so distinctly inferior to the Martini-Henry that traitors who wish to make war on the grand scale may well be ambitious of something better. Nor is it at all improbable that the leaders of the movement calculate—perhaps not altogether wisely—on the effect likely to be produced by capping the climax of an Irish anarchy with an English terror. If the Volunteers themselves do not mind a night or two on patrol, their wives and their mothers are by no means likely to regard the proceeding with satisfaction, and by the aid of wives and mothers a terror of a certain kind can very soon be established. Even to the sterner sex it is not a particularly comfortable thing to retire to rest with a vague expectation of being aroused by a skirmish in the back garden or the explosion of a magazine just round the corner. The carrying out of Mr. Gladstone's Midlothian instructions has had such remarkable success hitherto that his scholars may well be disposed to continue the course.

It is for Englishmen to say how they like this state of things. From the high patriotic point of view it is satisfactory doubtless to go without sleep for one's country. To have been indirectly instrumental in getting permission for the Irish police to use their buckshot, instead of playing with it, in strengthening Mr. Gladstone's coercion and weakening his concession, is also something to be (in a way) thankful for. But whether Englishmen like to find London and other towns in a modified state of siege is, we repeat, a question for Englishmen themselves to answer. It is, to say the least, odd that the presence of a certain party and of certain persons in Downing Street should seem necessarily to bring these delights with it. Perhaps it is not too much to pay for the intense satisfaction which, according to some people, we ought to feel at having for governor the most conscientious, the most intelligent, the most high-minded of statesmen. There is no rose without its thorn, and the thorn which persistently makes its appearance with the rose of Mr. Gladstone's advent to power may or may not be a severe one in its pricking. The rights of the citizen in Ireland have for some long time depended on the citizen's own power and willingness to guard his own head; the defence of the national property in England against armed force seems in the same way to be reposing chiefly on the volunteer efforts of patriotic persons. This would be wholly admirable in the case of a settlement in the backwoods; whether it is quite so admirable in the case of the greatest city in the world is a point on which there may be two opinions. At any rate, the chief consolation we can offer to the inhabitants of London is that gas will not explode without a considerable admixture of atmospheric air, so that the famous gasholder infernal-machine is rather difficult of actual arrangement.

ROMAN CATHOLIC STATISTICS IN ENGLAND.

THE *Tablet* at the commencement of a new year has given a Supplement, containing, under the title of "Thirty Years of the Catholic Hierarchy in England," some curious statistics as to the recent progress and present condition of the Roman Catholic Church in this country, which may be interesting to others besides its own members. The opening statement as to the incomes of Bishops, clergy, and places of worship since 1850, the year in which the hierarchy was established by Pius IX., is startling at first sight, but may easily—as indeed the writer himself admits—be taken to prove more than it really does. The Diocesan Bishops have increased, it seems, during that period from 8 to 14, while the numbers of clergy, regular and secular, and of churches are about doubled,

there being 1,962 priests and 1,175 churches and chapels in 1880, against 826 priests and 597 churches in 1850. The number of convents or religious houses for men is raised from 17 to 134. It is added, however, that the number of clergy still "does not suffice for the wants of the Catholic population," and that the proportion of priests to people is smaller than 100 or even 200 years ago. No doubt, as usually happens in such cases, the establishment of the hierarchy, by multiplying local centres of influence, has tended to bring in fresh converts, but the chief increase is notoriously due to the constant Irish immigration. Of another alleged cause, on which the writer dwells with enthusiasm, we may have a word to say presently. Of the actual number of converts, however, no precise calculation is supplied. It may be remembered that from the death in 1584 of Thomas Watson, Bishop of Lincoln under Queen Mary, there was no Roman Catholic prelate claiming diocesan jurisdiction in England till 1850, when Cardinal Wiseman was placed at the head of the new hierarchy, which provoked at the time so vehement a storm of opposition, and gave rise to the futile Ecclesiastical Titles Act, since repealed. For more than a century, down to 1685, there was no Roman Catholic bishop in England, the government of the small and decreasing handful of adherents of the Papacy being entrusted to archpriests. They had sunk by 1635 to 150,000, according to the report presented to Urban VIII. by Ranzani, the Oratorian, who was sent over here by him in Charles I.'s reign to collect information about the state of the Roman Catholics as well as of the Established Church. These 150,000 however appear to have had the very liberal allowance of 500 secular priests, 160 Jesuits, and 127 priests of other religious orders to look after their spiritual interests. The number both of clergy and laity is said to have been somewhat raised thirty years later, but on this point there is a diversity of testimony from different quarters. From that time began the government of Bishops *in partibus*, under the title of Vicars Apostolic. In the middle of the eighteenth century these Bishops reported that in the "London district"—including great part of the south of England—there were only 25,000 Catholics served by about 60 priests, and that there had been no perceptible increase for the last thirty years. In 1773 the number had somewhat fallen, but with the abolition of the penal laws the tide began to turn. Thus, while in Lancashire there were only 14,000 reckoned in 1773, and 15,000 in Yorkshire, who were scattered over more than 100 separate "missions"—whether served by as many priests is not explained—in 1804 Bishop Gibson reported a large increase and reckoned the Catholics in Lancashire at about 50,000—less than a tenth of their present number—and had in the whole "northern district" 85 priests, nearly all Jesuits or members of other religious orders. In 1815 the London district contained 78 chapels, twelve of which were in London, 104 priests, and 68,700 Roman Catholics.

When we come down to the present time, the increase, through various causes already referred to, is of course very considerable. "Two centuries ago the Catholics of England were 150,000, or at most 200,000, in number; now they may be reckoned at perhaps 1,250,000." And then we are told in a general way of many thousands of Protestant converts, but a caution is added as to a continual leakage going on among the poor. It is, we suspect, more than doubtful whether the conversions among the upper classes, whatever be their precise figure, have at all equalled the "losses to the Church" among the poor. In North America, in spite of the steady influx of German and Irish Roman Catholics, their relative numbers are said not to keep pace even with the increase of population. As regards the causes of conversion to the Church of Rome in England of late years the writer propounds his view in the following somewhat enthusiastic language:—

The influence of Catholic lay friends, Catholic literature, the general religious movement among the sects, the spirit of free inquiry, dissatisfaction with the intolerable inconsistencies and hollowness of Protestantism, and especially the preaching throughout the length and breadth of the land of Catholic doctrine, first by the Tractarians, and now still more boldly by the Ritualists—these seem to be, on the whole, the main causes which have led to conversions. To dwell only for a moment on the Ritualists, they are doing our work for us, and as time goes on they will do it still more effectually. As men found that Tractarianism was a half-way-house to Rome, so they will find that Ritualism is a stage or two further on. . . . We consider Ritualism to be, indirectly, the most powerful propaganda for the Church which England has yet seen.

It is true of course that one inevitable result of the Tractarian, as subsequently of the Ritualist movement, has been to contribute a certain percentage of converts to Rome, or perhaps it would be more accurate to say that these movements must be regarded as only part of the same great wave of religious thought passing over Europe during the last half-century or so, which is known on the Continent under the name of the Catholic reaction. But after fully allowing this we are by no means so sure as the *Tablet* writer as to these movements supplying "the most powerful propaganda for the Church" of Rome. The abstract question of the proper and legitimate result of Tractarian or Ritualistic principles, on which he proceeds to enlarge, is not one that can be discussed here, but as a matter of fact there is fully as much ground for saying that the Anglican revival has provided a resting-place for many who would otherwise have found the only satisfaction of their yearnings in the Roman Church, as for saying that they have created yearnings which Rome alone can satisfy. And we strongly suspect that an examination of statistics, if we had room for it, would show this to be a more accurate version of what has actually occurred. Mr. Gladstone has somewhere pointed out—that is indeed notorious—how few converts for Rome are gained from the Eastern Church: yet the theological and ecclesiastical

system of Eastern Christianity approximate more nearly to the Latin than the extremist phase of Tractarianism. But it would carry us too far from our present subject to pursue that inquiry further.

The compiler of the Roman Catholic statistics devotes a considerable portion of his paper to what students of ecclesiastical history will at once recognize as having always been a more or less burning question in the Western Church, the relation of the regular to the secular clergy. His language on the matter is studiously reserved, and he betrays a nervous anxiety to minimize the value of reports which have been suffered to ooze out as to a conflagration going on at this moment between the Bishops and the Heads of Religious Orders, which has been referred to the Court of Rome for decision. The rapid multiplication of orders and of members of different orders in England during the last thirty years has naturally forced this question to the surface. It appears that the Orders have increased during that interval from ten to twenty-six, and the religious houses from seventeen to one hundred and thirty-four; in the Westminster diocese alone the regular clergy have risen from nine to ninety-four. And the increase has taken place chiefly among the Jesuits and Benedictines, the former of whom it need hardly be said, are always the first to incur jealousy and suspicion. We have ventured to italicize a few words in the following passage, which may serve to indicate the essential divergence of interests and aims so fatal to any thorough and permanent harmony between what the writer himself calls the two great forces, centrifugal and centripetal respectively, constantly acting on the mechanism of the Church.

In referring to the organization and progress of the Church in England special notice must be taken of the important part to be borne by the Religious Orders and Congregations. The spirit of these is *neither diocesan nor national*, but in a certain sense *universal*. They are willing to recruit its numbers from all parts, and are ready, according to their means, to spread into all parts. The Religious Orders act as powerful auxiliaries of the fixed diocesan clergy, who must ever form the rank and file of the great army of the Church. Their members are moved from diocese to diocese, and from country to country, having an independent government of their own, which secures to them their organization, their spirit, and the end of their institute. Thus their members are exempt from the ordinary jurisdiction of the Bishop, except in those various cases which are laid down in the Canons. . . . It is perfectly true that Religious Orders are not essential to the existence of the Church, for the Church existed in all the perfection of her sanctity for centuries without them. But they are practically necessary to her well-being now. . . . "They are like auxiliary troops, specially necessary in these days, of whose zeal and activity the Bishops most sensibly and carefully avail themselves, both in the exercise of the sacred ministry and in the accomplishment of the works of Christian charity."

It is hardly necessary to read between the lines of this passage to understand the frequent, if not habitual, strain and tension in the relations of the ordinary pastors and bishops of any local Church with a power "neither diocesan nor national," having an independent government of its own exempt from episcopal jurisdiction, and having ends to serve quite distinct from the accustomed needs of parochial or diocesan organization and often conflicting with them. It is an open secret that great soreness prevails at present in England between these rival powers, and that the adjudication on their respective claims has been for many months past exercising the Roman authorities. Some years ago Archbishop Darby had a stand-up fight—if such a phrase may be allowed in a sacred connexion—with the Paris Jesuits, and held his own, in spite of Pius IX., who of course supported the Society. Leo XIII., in spite of the eulogy pronounced on the religious orders in his recent protest against their expulsion from France, is not credited with any very warm sympathy with the Jesuits especially, and even Cardinal Manning, though he availed himself of their services to the utmost at the Vatican Council, is believed not greatly to relish the *imperium in imperio* of the meddlesome and ubiquitous Society within the limits of his own archiepiscopal jurisdiction. The Benedictines, it is true, were both powerful and popular in the middle ages, and perhaps hold half the parishes of England in their hands, but the later Communities of Capuchins and Jesuits—the Jesuits especially—are far less answerable to ordinary rules and arrangements, and cherish a bolder and more ambitious spirit than the learned and dignified veterans whose fame is identified with the traditional glories of Monte Cassino and St. Maur. The mediæval enmities of Capuchins and seculars are recorded on wood and stone in the quaint carvings of gurgoyles and choirstalls still preserved in many of our ancient abbeys and cathedrals, and the sons of St. Ignatius are more isolated and grasping in their policy than the sons of St. Francis. The enormous increase of these religious bodies during the last quarter of a century, which is here triumphantly recorded, is an element of weakness as well as of strength to the Roman Catholic Church in this country. It is easy enough to reply that "the Catholics of England are too well aware of the baneful results of internal dissension, from their experience of its effects during the years of persecution, to tolerate its renewal." But after all prophecy is one thing and proof is another. Those who are familiar with the Memoirs of Panzani, to whom reference was made just now, will recollect what was thought in his day of the machinations of the Jesuits, and how readily he would have seen their services dispensed with. Nor are we by any means sure that the multiplication of these Orders now, "is an irrefragable proof of the esteem in which they are held by the English Roman Catholic episcopate," still less that it is an unmingled or indisputable augury of success.

THE SABRE.

MR. J. M. WAITE, formerly a corporal major in the 2nd Life Guards, and now a teacher of fencing and sword-play, has just published a manual of instruction (*Science of the Sabre*, &c. By J. M. Waite. London: Weldon and Co.) in the use of the sabre which, if it receives the attention it deserves, will probably alter largely the established method of attack and defence now followed by all professors of the sword in England. Mr. Waite has for long been known as an excellent fencer and as an adept at sabre-play and single-stick, and his stalwart figure is familiar to all those who go to see assaults of arms. Now, after full experience in the arena, he comes forward as a writer on the art of using the sword, and as a bold innovator on the established system. At the outset he is, very rightly, careful to show that he does not either lay down the law or alter the law without good qualifications for so doing. At the beginning of a modest and sensible preface, which speaks well for the literary cultivation that prevails in the Household Brigade, he states that his book is the result of long experience, and that before he began to teach himself he was so fortunate as to be trained by teachers of the highest skill. As pupil and assistant he practised long, he says, under the late M. Prevost, one of the best fencers of his day, as all who are learned in the history of the small-sword know, and in the use of the sabre and single-stick he was instructed by Platts, who had acquired from Bushman his method of using the broadsword. Clearly, then, Mr. Waite underwent an exceptionally full and severe training in the art to which he devoted himself; and, since this training has been followed by years of incessant contest with all comers, and by much practice in teaching, he certainly is one entitled to speak with some authority, and should be listened to when he proposes considerable changes in the recognized methods of disposing of an adversary. These changes are due to Mr. Waite's knowledge of the small-sword. When he had attained thorough proficiency, he was struck, it seems, by the deficiencies of the established English system of sword-play, in which, as in the German tactics of the last century, the most formidable means of doing harm were ignored. He says:—

When, after no short or easy period of probation, I became in my turn an instructor, and gained that knowledge which can only be gained by teaching and by constant combat with adversaries of all degrees of strength, it appeared to me that part of the course I had gone through had been somewhat conventional, and though the system of fencing which I had learnt from Prevost could scarcely be altered for the better, the English method of sabre play, good as it was, could be considerably improved. Sabre players, as a rule, have not been fencers, or at least have been fencers of trifling skill. Accomplished fencers have usually, from an exaggerated fear of losing their lightness of hand, not cared to work much with the sabre. The consequence has been that no attempt has been made to bring knowledge of the small sword to bear upon sabre play, and that little attention has been given to what is really the most formidable way of handling the latter weapon. Those who have taught its use seem to have thought of little else than the cuts which can be given with it, and to have overlooked the fact that the modern sabre, essentially a cut-and-thrust weapon, can be used with great effect for thrusts, and that, when thrusting, a man exposes himself less and is more likely to disable his antagonist than when he delivers a cut. It is true that one or two thrusts have been taught, but small reliance has been placed in them, and several of the fencer's methods of attack and defence which are admirably suited for sword play have been altogether neglected.

This must have seemed to the mind of a thoughtful professor of swordsmanship a very shocking state of things; and the pain which a sadly narrow theory of sabre-play caused him was doubtless increased when he discovered that some original thinker had pointed out that when a cut is made the sword passes through a greater distance than when a thrust is made, and that a cut is therefore necessarily slower than a thrust. To remedy the evil condition of things he set vigorously to work, and, as he was mercifully afforded numerous subjects for experiments in the shape of adversaries who presented themselves, he was able to conduct his investigations in a very thorough and satisfactory manner. He endeavoured, he says, to improve sabre-play by introducing into it many movements of the fencer, and by copying his method of attack, and he was stimulated by a just feeling of the importance of his subject. Sabre practice, he says rightly enough, is not a mere exercise, but a course of training which teaches a man how to defend his life; and clearly, therefore, a really efficacious, and not a traditional, method of handling the sword should be adopted; and he further observes, with undeniable justice, that a soldier's chance of victory in a hand-to-hand contest with a determined antagonist is not likely to be improved by the fact that his instructors have forgotten that a sabre has a point as well as an edge, and have not taught him the most formidable way of using the weapon they have placed in his hands.

This instruction Mr. Waite now seeks to give. He does not neglect the old system, as he describes carefully the established cuts and guards; but to these he adds a series of movements taken from fencing, and it is his description of these which is likely to attract the attention of thoughtful sabreurs. It would be futile to attempt to give even a summary of the various methods of attack and defence which he very clearly describes, but it may be briefly said that the principal attacks of the fencer, such as the *coup droit*, the *dégagement*, *une deux*, the *battement et dégagement*, are adapted to the sabre, it being of course assumed that the straight cut and thrust sabre is used. Of the value of these in sword-play there can be little doubt. Lunges or thrusts can be made more quickly than cuts, and are far more deadly. A sabre cut may only infuriate a bold foe, but a man who is run through the body

falls to the ground; and in contests with such adversaries as the Indian swordsmen, the soldier who has mastered the movements described by Mr. Waite will be certain of victory. He will disable his antagonist while the latter's sword is still in the air, or will draw his attack, and then deftly use the point long before the other can parry. Perhaps the movement which against such antagonists, or indeed against any wild swordsman, will avail most, is the *coup d'arrêt*, or atop thrust, which, with many other movements, Mr. Waite takes from fencing. As the right way of delivering it is not always understood in England even by those who practise the small-sword, and, as it is often confounded with the *coup de temps*, or time thrust, from which it is essentially different, it may be well to give some description of the two. The time thrust is the most difficult of all hits in fencing, so difficult and so dangerous indeed, that few are likely to resort to it *sur le terrain*. The fencer who delivers it must be acute enough to perceive that his antagonist is going to make a feint before attacking him, and must judge rightly what that feint will be. Then lunging with great rapidity the instant the other begins, and carrying his hand well to the right or left, and high or low, as the case may be, he catches the blade of his adversary on the false movement, thereby effectually stopping the attack, and at the same time impales him. It is scarcely necessary to point out how difficult it is to make rightly such a guess as has to be made here, and, though the time thrust is often delivered by some very accomplished French fencers, who acquire a wonderful power of reading their antagonist's intentions, there is always great risk about it, as if the fencer guesses wrong he falls most ignominiously. The stop thrust is a rougher, but at the same time more effective, way of dealing with an adversary. It is intended to stop those who run in or make a step or two forward before attacking. The fencer who delivers it lunges out directly the other moves, and as generally a man's sword is disordered most irregularly when he is running in or making a step before attacking, the master of the *coup d'arrêt* in nineteen cases out of twenty hits his antagonist and remains untouched himself. "Immediately," says Mr. Waite, "that you see him [the antagonist] move, deliver a straight thrust at his breast with a lunge, you will then, if your movement is done in proper time, find your point on his breast as he has completed the advance, and he will be unable to lunge and deliver his attack." The *coup d'arrêt* may be combined with the *coup de temps*, but this master-stroke is rarely achieved even by the most skilful. How efficacious the simple *coup d'arrêt* is need scarcely be pointed out. In sabre-play, which is usually much wilder than small-sword-play, men frequently rush on to their adversaries, and doubtless bold assailants often do the same in actual combat. In either case the *coup d'arrêt* is better than any parry, and assuredly when real blades are used the man who receives it will "be unable to lunge and deliver his attack," as he will infallibly be run through the body and probably stopped by the pommel of the sword against his breast. The other processes described by Mr. Waite for obtaining this desirable result are perhaps not quite so thorough and effectual as the *coup d'arrêt*, but they are extremely practical and have great merit, and there can be no doubt that he is right in recommending to amateurs of the sabre the adoption of many of the fencer's movements. It is true that these have not been altogether overlooked, as is pointed out in the passage which we have quoted; but to Mr. Waite belongs the credit of showing fully how the sabre can be used for thrusting and of greatly improving the present method of sword-play. His well-written manual should receive the attention not only of amateurs of sabre-play and single-stick, but also of those who instruct soldiers in the use of the weapon. Let it be hoped that within four or five years the Horse Guards may become aware of the existence of this excellent little work.

One portion of it may not possibly attract the attention of some who know nothing of cuts and guards and take not the smallest interest in swordsmanship, but are fond of literary curiosities. To such the elaborate series of rules and instructions for sabre duels which Mr. Waite has translated from the Comte de Chateaullard's terrible "Essai sur le Duel" will not be unattractive, and there is no presumption in surmising that to most English readers they will be new. A very curious series of rules they certainly are, and the author or compiler seems to have taken great pains to show how gentlemen should conduct themselves when they desire to maim or kill each other. As a specimen of his minute and careful legislation, we will quote Rules 7, 10, and 11:—

7th.—When the combatants are placed, the seconds measure the blades, which must be of equal length and similar shape. The choice of the sabre, if similar ones are used, must be tossed for. If by carelessness the sabres are not alike, the choice should still be tossed for; but if the sabres are too disproportioned for such a combat it should certainly be put off.

10th.—The seconds, after having invited the combatants to take off their coats and waistcoats, must go up to their principal's opponent, who must show his naked breast in order to prove that he wears nothing to protect himself against the edge or point of the sabre blade. His refusal would be equivalent to a refusal to fight.

11th.—When what is above described is finished, the seconds should toss for which one of them is to explain the conventions of the duel to the combatants, to whom the weapons are then given, with the recommendation to wait until the signal is given to begin.

Much more provision is shown here than in the framing of many Acts of Parliament, and the other ordinances have all been drawn up with the same thoughtful care; and it is worth notice that the legal prosecution of a combatant guilty of unfair play is strictly

enjoined as the duty of the seconds on both sides. These curious regulations form an appropriate conclusion to Mr. Waite's manual. After teaching sabre-play very fully, he gives the rules which those who wish to make practical use of the weapon are bound to follow.

THE PROSPECTS OF THE MONEY MARKET.

THERE is much uncertainty amongst business men as to the probable course of the money market during the year that has just opened. In the early part of the autumn most competent observers were of opinion that the value of money would now be much higher than it is. Trade had been improving for a twelve month, and would evidently continue to improve at a still more rapid rate. Speculation was even more active than trade, and in the United States a great demand for gold was springing up. These were all causes to make money dearer, and competent observers concluded that they would produce their natural effect. But, as a matter of fact, they have not done so to the extent expected. Until a few weeks ago, the Bank of England rate of discount remained at 2½ per cent. per annum, and, except for about two days when the rise occurred, the open market rate was always so much lower that the Bank practically did no discount business. The rate was raised to 3 per cent., and ever since the Bank has been out of the market. It has lent money for Stock Exchange requirements in very large amounts. But genuine discounting, except for its regular customers, it has not done. The calculations of a few months ago being thus so glaringly disappointed, people ask whether reasoning on the probabilities of the present may not turn out equally fallacious. There is, of course, no answer to the question save that men must act on the best opinion they can form, and that the best opinion is that which has the strongest probabilities in its favour. This, we venture to think, is the case in the instance before us. For how is it that the value of money has not risen as anticipated? The cause is found in the fact that the Bank of France acted contrary to the received principles of good management in the case of banks holding the ultimate cash reserve of the countries to which they belong. When it was seen that a great demand for gold was springing up in the United States, which the United States had it in their power to gratify because of the large sums due to them by Europe for wheat, Indian corn, cotton, bacon, butter, meat, tobacco, and other produce, competent observers concluded that the Bank of France, on which the demand chiefly fell in the first instance, would raise its rate of discount high enough to make it too costly to take away gold. Had it done so, the Bank of England, to protect its own reserve, would have followed the example; and thus money would have been made dear. But the Bank of France disappointed all expectations. The French Government thought that it would be injurious to the Republic to check trade and speculation by raising the value of money, and induced the Bank to abstain from the measures which would have protected its metallic reserve. Although, therefore, events have not turned out according to the expectations of competent observers, these latter were perfectly right in their reasoning. The economic causes would have made money dearer had not political influences interfered. It is quite possible, of course, that politics may again derange the money-markets. But it is not our province to discuss the political situation. Our reasoning is based on the assumption that the purely economic causes are allowed to act uninterruptedly. Each reader must modify for himself the conclusions according to what he thinks the probable course of political events.

The first economic fact to note is that the improvement in trade is likely to assume still greater proportions in the year upon which we have just entered. As yet it has only just gone far enough to give full employment to the working classes, without leading to a rise of wages except in a few instances. Even so, however, the various branches of trade have been carried on profitably for a considerable time now, which means that the capitalists of the United Kingdom have been receiving a handsome return on their investments. They have a strong motive, therefore, for putting new capital into their businesses, for enlarging their concerns, for taking on new hands, and generally for extending their operations wherever an opening offers. All this implies the sinking of considerable sums in the form of fixed capital, and the stretching of credit so as to take advantage of new chances of profit. But stretching of credit is the creation of a large new demand for capital to work the businesses. At the same time the full employment of mills, which a year ago were closed altogether or going only two or three days a week, means an enormous increase of the outlay on labour all over the country. Employers need more money to pay their workpeople, for which purpose cheques are totally inapplicable. Wages must be paid in cash, and the wage-earners, having no bank accounts, retain the money in hand to meet their weekly expenditure. Thus every increase of employment implies a corresponding increase in the circulation—largely, no doubt, in the circulation of silver, but to no small extent also in that of gold and notes, the latter being based upon gold and therefore equivalent to it. Furthermore, every increase of employment even at the old rates of wages leads to an increase in the demand for articles of general consumption. A family, which had been working only three days a week, or which had been living from hand to mouth by picking

up odd jobs, and which has now constant, regular employment, is necessarily a much better customer of the butcher, baker, and grocer. It is able, too, to replenish its wardrobe, and to replace the carpets, curtains, and other articles of furniture parted with in the bad times. When this increased buying is multiplied by thousands, and spreads over the whole of Great Britain, the magnitude of the effect will be realized. The small tradespeople, who had lost so many of their customers while trade was bad, or kept them only by giving credit, find themselves once more in funds, and are able in their turn not only to lay in a larger stock of the goods in which they deal, but also to extend their own personal expenditure. In this way the effect of the first improvement is transmitted from class to class, and from trade to trade; and as it goes on widening it gives employment to more and more new capital. The struggling grocer, who finds his customers suddenly increasing their expenditure, and requiring articles which for years they had been obliged to go without or to buy in very sparing quantities, and who in consequence has to add to his stock, requires additional capital just as much as the millowner, whose machinery has been idle half the week and is now working high pressure. But this general demand for additional capital as necessarily tends to raise its value as does enhanced demand for any other article. At the same time, however, capital itself is becoming more plentiful. Of the increased profits and earnings of all classes a part is saved, and goes into the banks to be employed in the short loan market. The larger portion, no doubt, is invested in the businesses of those who accumulate it; and another portion is invested in Stock Exchange securities. But a considerable part goes into the banks, and thus tends to satisfy the demand for additional accommodation. When, by the inaction of the Bank of France, the greater part of the American demand for gold was thrown upon Paris instead of upon London, this growth of capital sufficed hitherto to keep down the value of money. There was such a vast mass of idle capital when the revival of trade began, that considerably to enhance the value of the whole, reinforced as it has been since, required a long continuance of improvement. But now a new force is coming into play. The workpeople are moving all over the country for an advance of wages. In some cases the advance has been given, and before long it must be conceded everywhere. But a general rise of wages will affect the money market in the two ways pointed out above. It will swell the circulation by increasing the amounts paid away in wages; and it will add to the purchasing power, and, therefore, to the consumption, of the working classes.

Even, then, if we were to confine our view to the home trade, we see abundant reason for concluding that the value of money must tend upwards. And, when we extend our examination to the foreign trade, these reasons are strongly confirmed. There has been of late a general recovery of the raw-material-producing countries, and their recovery has already resulted in a marked increase of the trade with this country. This must continue for some time longer. In the case of the most important of them all, the United States, there appears likely a very great augmentation. When prosperity returned to the United States, they took up again the schemes of railway construction interrupted by the panic of 1873. The first result was an extraordinary demand for English iron and steel. But very soon the native production and manufacture overtook the demand. The works so long idle were set going again, and, favoured by the protective tariff, were able to undersell this country. It would seem, however, that the consumption is now outstripping the production, and that recourse must again be had to this country. Vast as was the railway construction of the past year, that of the present promises to be still vaster, and renewed American buying of iron will at once send up the price of coal as well as of iron. Nor is it only the United States that are building railways on an immense scale. Mexico is also to be opened up. Concessions of various lines have been granted, and some are actually being constructed. The South American States are likewise resuming abandoned projects. Thus, a large foreign demand for English iron and steel appears probable, involving, as we have just said, a rise of the prices of both iron and coal. But a rise in the price of coal and iron—that is, of the instruments of manufacture—would enhance the cost of production of almost every article. In other words, the capital necessary to carry on nearly every kind of business is likely to be increased, not alone by increased production and a rise of wages, but also by the enhanced cost of both iron and coal. But everything which makes additional capital necessary, of course tends to raise the value of capital. There is one other cause remaining to be noticed, which is likely to affect the money market powerfully. We mean foreign borrowing. As yet there have been few State loans launched since the recovery of credit. India and the colonies have had recourse to this market, and so have Portugal and a few others; but there is still a hesitation to bring out loans for foreign States. But foreign loans for industrial purposes are already very numerous. This very week we have had a very considerable example in the issue of the Northern Pacific Railroad Bonds, amounting to four millions sterling, and many more are to follow. No doubt, a portion of the proceeds of those loans, greater or less as the case may be, will be spent in this country in the purchase of materials and in the payment of commission, freight, and other charges. But a portion also will be sent abroad, and will thus diminish the disposable capital in the market. If there should also be a demand for gold for abroad to

any amount, either for currency requirements, such as we experienced of late from the United States, or for the resumption of specie payments in Italy, this would still further affect the market. And all the enhanced demand, which we have been tracing, will come upon markets already weakened. In the five last months of 1879 and 1880 the United States took from Europe very nearly 30 millions sterling in gold, and absorbed all the metal produced at home. The great European banks, therefore, are not well supplied with gold.

WINTER EXHIBITIONS.

THE full and brilliant display of the work of certain masters of the Dutch school lends a special distinction to the array of Old Masters at Burlington House. The collection is altogether of the highest interest and value; and it is perhaps not worth while, where there is so much that is good, to institute any comparison with what has been shown in former years. The great English artists have often been in greater force; and yet, both of Reynolds and of Gainsborough, there are admirable and characteristic examples. The display of Italian art in the period of its highest development is saved from insignificance by the presence of Lord Cowper's *Raffaelles* and one or two fine portraits by Andrea del Sarto; while of the earlier schools there is enough to illustrate the special aims of painting at a time when it laboured constantly in the service of religion, and when its practice was determined by a strict regard for decorative effect.

It is worth while to compare these examples of primitive art with a collection of designs by living painters which are now being exhibited in the Grosvenor Gallery. To the later pictures at Burlington House we shall speedily return for longer and more careful study, but in the meantime it is interesting to note how far the most recent development of painting in England has sought instruction and support in the models of the fifteenth century. It is too often assumed by those who have made no special study of the history of painting that the peculiar manner in which the earlier artists worked was wholly due to imperfect knowledge and to the immaturity of their powers. The difference between a Mantegna and a Titian, or between a fresco by Ghirlandajo and the later work of the artists of the Roman school is confidently assigned to the different degrees of technical proficiency which these men respectively possessed; and what is strange to us in the manner of the artists of the quattrocento is accordingly excused on the ground that they knew no better, and that they did the best that could be done within the straitened limits of the art of their time. The critics who willingly extend this indulgence towards the earlier masters are, however, altogether intolerant of all work in our own day which attempts to revive these primitive forms. It is deemed an unpardonable affectation to look to Masaccio or Mantegna for instruction when we have as our inheritance the more perfect productions of the later schools, and the work that is done under such influences is dismissed as being altogether wanting in originality and in the feeling of sympathy with the present age. A very little consideration, however, will serve to show that this line of argument rests upon an imperfect understanding of the different aims proper to art. It is, no doubt, partly true that the earlier men were hampered by insufficient knowledge, but this of itself will not account for all that is distinctive in the manner of their work. Technically speaking, painting, as it was originally practised in modern Europe, was regulated by a strict regard for ornamental effect. It was in the hands of men who were often at the same time architects, sculptors, and even goldsmiths, and who therefore brought to their work in colour influences derived from the simultaneous study of other crafts. The imitation of nature in the sense in which it was understood by the later schools was kept in check by a controlling sentiment for that quality of design which is common to all the arts; and it is to the supremacy of this sentiment that we owe the striking versatility of power discoverable in many of the older artists, and which enabled them to pass from sculpture to painting, and from painting to architecture, without effort and without failure. It is unquestionably true that, as the technical resources of painting developed, these conditions underwent a gradual process of revolution. An increasing facility in reproducing the actual appearances of nature induced a stronger feeling for the charms of illusion. Art became more and more absorbed by the intricate and difficult problems of light and colour, until at last the painter, no less than his public, came to think of a picture as an exact image of reality, capable of being identified at all points with the objects which it undertook to represent. It will be observed, however, that this conception of art cannot always fit with the requirements of decoration. Here the first condition is not imitation, but ornament, and therefore the realism which is proper to an easel picture must be subordinated to a sense of order in arrangement of line, and of harmonious balance in colour. The attempted revival during the last few years of the practice of decoration has not unnaturally led to a reconsideration of these principles, and by an inevitable tendency painters who have devoted themselves to this branch of art have turned for example to that epoch in the history of painting when its ornamental functions had the most decisive ascendancy.

These remarks may serve by way of general comment upon

much of the decorative work that is now exhibited in the Grosvenor Gallery. What has been said will not of course dispose of the many conflicting opinions that are aroused by the art of a painter like Mr. Burne Jones, but it may enable us the better to understand his intention. In deliberately seeking to revive some of the earlier modes of expression, he is not, we may be sure, led by mere caprice, or by a pedantic regard for the past. If he chooses for models of imitation the earlier masters of Florentine design rather than great magicians with the brush like Titian or Rubens, it is because he perceives that the aims of these later men do not accord with the special purpose of his work. What is too readily assumed to be the wilful affectation of his art ought not then to put any one in a passion. There is enough here to prove that he is a man of exceptional talent, of rare industry, and of an inexhaustible invention. The particular cast of his imagination has for a large number of persons no sort of fascination; for others it possesses a strong and enduring charm. To reconcile these opposite opinions is obviously not the business of criticism, nor indeed is it at all necessary or desirable that the available enthusiasm of the world should be all directed to the same goal. But it is of importance in view of the modern feeling for decoration that the relation which such art as this holds to the other products of our time should be rightly understood. There is no greater blunder than to suppose that a new departure in painting can be made in absolute independence of what has been done in the past. The cry for originality in all the arts is the pet vulgarity of our day, and if we look back to those seasons in the world's history which have really left us a great inheritance of original work, we shall find that they have always been characterized by a spirit of the frankest and most liberal appropriation from the accumulated stores at their command. Benvenuto Cellini, the most robust of artists, thought it the highest honour to try to imitate and to rival the grace of antique sculpture; it was a constant reproach to Mantegna in his day that his designs were only a rigid copy of bas-reliefs on Roman monuments, and we know in the case of a noble genius like Raffaele how gladly he took from Perugino all that Perugino had to give. To say, therefore, that Mr. Burne Jones frankly and studiously seeks to revive the principles of Florentine design is in effect only to declare that he has chosen the models that best accord with the particular bent of his genius. The effort that he is making, whatever may be the ultimate judgment upon his individual powers, cannot but powerfully assist the movement with which he is associated; and, if the visitor to the present exhibition at Burlington House will frankly survey the successive developments of art in Europe, he will be disposed, we believe, to grant that there is something that is distinguishable from affectation in the endeavour to revive the practice of a school whose triumphs were founded upon the art of design.

The remaining contents of the exhibition at the Grosvenor Gallery are of a more familiar order. A collection of water-colour drawings by English artists is supplemented by some interesting specimens in the same material by representatives of the contemporary school of France. The particular direction which water-colour art has recently taken in England is very strikingly illustrated by the comparison which we are thus enabled to make between the products of the two countries. The French work is strangely different from our own, but it bears at the same time a strong affinity to the earlier efforts of our school. While the younger professors of this branch of art are striving to force the material into competition with oil, and in the pursuit of this ambition are overloading their drawings with body-colour, the Frenchmen, like the Dutchmen who were represented last year, show that they are content to labour in the tradition established by the earlier masters. They are content, that is to say, to confine the use of water-colour to purposes for which it is obviously adapted, and are therefore enabled to preserve a quality of execution which many of our own painters have lost. It is not, of course, to be said that these criticisms apply with equal force to all the native work that is displayed in the exhibition, or that the freer and more brilliant manner of the foreign artists is always used with good effect. In some instances the evident cleverness of manipulation is too recklessly asserted; there is, as it would seem, a desire to impress the spectator with a sense of the artist's dexterity; but, taken as a whole, these French drawings do undoubtedly serve to remind us of a quality which English water-colour art once possessed, and has now partly lost.

THE CUP AT THE LYCEUM.

THE Laureate's new play has an amount of dramatic force which may not have been expected. Part of *The Cup* is in the best sense both dramatic and poetic. It is deliberate rather than slow in action, and in this as in some other things has or suggests a resemblance to the Greek tragedy, and, as in Greek tragedy, the action waits but does not halt. Like the French poet with whose name M. Taine contrasted that of Mr. Tennyson, Mr. Tennyson has caught that sense of impending fate which Musset delighted to catch, and has impressed it upon his audiences with delicacy and force. Musset gave both to his modern dramas and to his dramas of definite past periods, and most especially to his dramas which might have belonged to any period, that curious feeling of a grim fate waiting to overtake the personages

who seemed to themselves to be living untroubled lives, which has been often commented on. It was his singularity that he never went back into the time with which Mr. Tennyson has dealt, and dealt successfully. The story of *The Cup*, as told by Plutarch, is one which in its motive is unhappily enough common, like all really moving tragedies, to all time. Mr. Tennyson has made of it a play which refutes to a great extent the opinion that his genius had no dramatic side, and which may rank hereafter among his best works.

The plot of the play, in spite of Plutarch, of Thomas Corneille, and of other dramatists, is not likely to be familiar to the majority of English readers or playgoers. In the *Comma* of Thomas Corneille—too little known by his really good work; too much known perhaps by the great Dumas's celebrated repartee, "Adieu, Thomas!"—Sinorix appears as a usurping tyrant who has poisoned Sinnatus, King of Galatia, because, having promised his hand to Hesione, daughter of Sinorix, he has found that he likes Camma, Sinorix's wife, better than Hesione. In the first scene Sinorix tells Phœdime, his confidant, in words which cannot but amuse people who remember a well-known modern comedian's well-known catchword,

Cependant, tu le sçais, je ne suis pas heureux.

Meanwhile Sostrate, a friend of Sinnatus, is embarrassed by his co-existing affections for Hesione, for Camma, and for Sinorix. Here of course is plentiful matter for that kind of intrigue in which the French classical drama delighted, and equally of course regard to the unities and to the conventional decencies of that drama makes the catastrophe of Thomas Corneille's play very different from the catastrophe of Mr. Tennyson's. Death is not seen, but is reported by eye-witnesses, and in many other minor matters into which it might be tedious to go, the difference between the two methods is strongly marked. In Mr. Tennyson's version, as presented at the Lyceum, the first scene shows us a distant view of "A City of Galatia among wooded hills. Before the Temple of Artemis." Synorix appears upon the stage, and his first speech gives some clue to his character and to the tragedy which underlies the beauty of the two first scenes:—

Vine, cypress, poplar, myrtle, bowering in—
The city where she dwells. She past me here
Three years ago when I was flying from
My tetrarchy to Rome. I almost touch'd her—
A maiden slowly moving on to music
Among her maidens to this Temple—O Gods!
She is my fate—else wherefore has my fate
Brought me again to her own city. Married
Since—married Sinnatus, the tetrarch here—
But, if he be conspirator, Rome will chain
Or slay him. I may trust to gain her then—
When I shall have my tetrarchy restored.
I never felt such passion for a woman—
What have I written to her?

This fine speech, as finely delivered as possible by Mr. Irving, may serve in some measure to illustrate the comparison which we have made between some of Musset's plays and *The Cup*. It is charged with the sense of impending trouble of which we have already spoken; and yet it must be noted that, like Musset, Mr. Tennyson has left it to the actor to understand and express this sense. Synorix, during the last few lines, produces a cup from under his cloak, and what he has written and what he reads to himself is this:—

To the admired Camma, wife of Sinnatus the Tetrarch, one who years ago, himself an adorer of our great goddess Artemis, beheld you afar off worshipping in her temple, and loved you for it, sends you this cup, rescued from the burning of one of her shrines in a city through which he passed with the Roman army. It is the cup we use in our marriages. Receive it from one who cannot at present write himself other than *A Galatian serving by force in the Roman Legion*.

From the reading of this letter to the end of the first act the action of the piece is close and steady. Sinnatus passes with his hounds and followers. Synorix invites himself to join the hunt, and the scene changes to the interior of Sinnatus's house, where Camma is waiting anxiously for her husband:—

No Sinnatus yet—and there the rising moon—
Moon on the field and the foam,
Moon on the waste and the wold,
Moon bring him home, bring him home,
Safe from the dark and the cold,
Home, sweet moon bring him home,
Home with the flock to the fold
Safe from the wolf.

These lines are sung by Miss Ellen Terry with exquisite grace and feeling to a harp or lyre accompaniment, music of the most attractive and appropriate kind having been written for them by Mr. Hamilton Clarke. Synorix, who has introduced himself under the assumed name of Strato, comes in with Sinnatus, and overhearing some communication from a soldier to Sinnatus touching "our anti-Roman faction," sees his way to his plot. Left alone with Camma, he tells her that Antonius, the Roman general encamped outside the city, has orders to capture Sinnatus and put him to death by torture. Camma's entreaties may prevail against this, and she will do well to intercept Antonius as he passes in the early morning outside the Temple of Artemis. Meanwhile, Synorix has been recognized, and the populace are clamouring for his life, for the tale which Antonius says in the former scene he has heard—

That your own people cast you from their bounds
For some dishonour done to some man's wife,
As Rome did Tarquin—

is a true one. Sinnatus, loathing the man, but remembering that he is his guest, though self-invited, tells him in the same breath of his hatred for him and of a way of escape. Camma, presently left alone after a charming love scene with Sinnatus, debates with herself as to what is best to do. She says of Synorix:—

His face was not malignant, and he said
That men malign'd him. Shall I go? Shall I go?
I go—but I will have my dagger with me.

The third scene shows an open space before the steps of Artemis's Temple. Sinnatus, after a brief colloquy with Antonius, speaks a soliloquy which seems to be the clue to his character:—

I have my guard about me.
I need not fear the crowd that hunted me
Last night across the woods; I hardly gained
The camp at midnight. Will she come to me
Now that she knows me Synorix? Not if Sinnatus
Have told her all the truth about me. Well!
I cannot help the mould that I was cast in;
I fling all that upon my fate—my star!
I know that I am genial, and happy
Would be, and make all others happy—so
They did not thwart me. Nay, she will not come.
Still, if she be a true and loving wife,
She will perchance, to save this husband. Ay!
See, see! my white bird stepping toward the snare!

There is a villany about this which may seem revolting enough when it is read in cold blood, but which, as Mr. Irving speaks the lines, is curiously impressive. A short and stormy dialogue ensues between Synorix and Camma, who at once suspects the trap into which she has fallen. She refuses to walk with him towards the camp, and he replies:—

Then for your own sake—
Lady, I say it with all gentleness—
And for the sake of Sinnatus, your husband,
I must compel you.

At this she draws her dagger; Synorix wrests it from her; and Sinnatus, rushing in upon Synorix, is stabbed with his wife's weapon. With his dying breath he tells her to take refuge in the Temple of Artemis, and Synorix ends the act with a fine soliloquy over the dead body.

Thus far the tragedy is both poetical and dramatic; the second act, while it contains some admirable poetry, has, as it seems to us, far less of dramatic craft. Half a year has passed, and Camma has, "for her beauty, statelyness, and power," been chosen Priestess of the Temple. Synorix's ambition, meanwhile, has been gratified by his being made King of Galatia, and Camma, seeming to yield at last to his oft-repeated entreaties that she will marry him, puts poison in the cup from which they each drink as part of the ceremony, and which is the same cup that Synorix presented in the first act. Here, as it strikes us, is matter for dramatic effect which the poet has neglected. All through the latter part of the act one expects some fiery scene between Camma and Synorix, when she reveals to him what her true purpose in bringing him into the temple has been. No such scene is given to us, and the want of some such scene is the more marked by the odd carelessness which Synorix displays when Camma (after she has poisoned him, be it observed) cross-questions Antonius as to the lies told by Synorix to gain his end in the first act. All the effect produced upon him by these sudden and pointed questions is to make him say "Go on with the marriage rites." Almost immediately afterwards he dies, saying to her, "Thou art coming my way, too." Her death follows close upon his with the speech:—

My way? Crawl, worm; crawl down thine own dark hole
To the lowest Hell.

Have I the crown on? I will go
To meet him, crown'd, crown'd victor of my will—
On my last voyage—but the wind has fail'd—
Growing dark too—but light enough to row.
Row to the blessed Isles!—the blessed Isles!—
There—league on league of ever-shining shores
Beneath an ever-rising sun—I see him,
Sinnatus! Sinnatus!

It is impossible to imagine this speech being more beautifully delivered than it is by Miss Ellen Terry, and yet it cannot avoid having a certain suspicion of anti-climax. One singularly fine passage in the scene has the dramatic force and impressiveness which seem to us to be wanting in the final scene. This is the invocation of Artemis, first by Synorix, then by Camma, with its accompanying chorus. This is, both from a poetical and dramatic point of view, as good as possible, and the music is admirably arranged by Mr. Hamilton Clarke, who produces a most striking effect by taking the last "Artemis" in the last invocation by the chorus an octave higher than it is taken in the corresponding notes of the previous passages.

Miss Ellen Terry's performance of Camma fully justifies the opinion as to the extent of her powers which has frequently been expressed in these columns. It is charged with grace, dignity, and tenderness, and the conflicting passion of the last act is given with extraordinary force. The invocation of Artemis already spoken of might alone stamp Miss Terry as a great actress. Without any trick of gesture or of voice, almost without any perceptible departure from her ordinary method, the actress yet manages to give a deadly force to every word. Here the excellence of Mr. Irving's byplay serves to accent more strongly Synorix's really stupid indifference to the burning questions which Camma afterwards puts to Antonius. In the part of Camma the one fault which we have sometimes observed in Miss Terry's acting, a certain

tendency to monotony or trick of gesture, has completely disappeared. Nothing could be finer than her action and attitude throughout. Synorix is, as may be guessed from our quotations, a singularly difficult part. Mr. Irving plays it with rare skill, picturesqueness, and impressiveness. Mr. Terriss gives a pleasant bluntness and manliness to the hunter Sinnatus. What is meant by the observation that he seems "modern," we are unable to understand. Mr. Tyars gives weight and dignity to Antonius. It is impossible by description to convey an adequate idea of the beauty and artistic correctness of the scenery and mounting of the piece. The most striking effect is produced by the last scene in the interior of the temple, with its seemingly solid pillars, and colossal image of Artemis at the back. Here there is artfully suggested a sense of vastness which recalls De Quincey's wonderful description of his "Consul Romanus" dream. The grouping and the management of colour shown in it are alike admirable.

REVIEWS.

ENGLISH LAND AND ENGLISH LANDLORDS.*

MR. BRODRICK'S comprehensive work on the land system of England is in a high degree useful and instructive. Those who differ from his conclusions may derive from the book much valuable information; and he is the more likely to obtain disciples and converts because he is fair in statement, sincere in his desire to ascertain the truth, and but moderately and legitimately pugnacious. Though Mr. Brodrick is well known as a strong party politician, he for the most part concerns himself in the present work only with social and economic interests. His residue of prejudice finds comparatively harmless expression in such phrases as "fatuous policy" applied in the spirit of a Whig of seventy years ago to the heroic resistance of England to the tyranny and ambition of Napoleon. It is only by accidental good fortune that in his main argument Mr. Brodrick swims with the stream. He would deprecate entails and primogeniture with equal earnestness if he were not, through the progress of democracy, on the winning side. He will perhaps regret to see that his conclusions are adopted in practical legislation, not so much because they are sound, as in compliance with the demands of constituencies from which landlords, large farmers, and substantial tradesmen will be practically excluded. The master of thirty legions may sometimes be in the right; but his triumphs in controversy are attained, not by weighing reasons, but by counting heads. Mr. Brodrick's moderate proposals scarcely seem to satisfy his own theoretical aspirations. They will almost certainly be overtaken and left behind by Parliaments representing labourers and artisans distributed into equal electoral constituencies. Landowners will find no hearing for any answer which they may wish to offer to Mr. Brodrick's vigorous arguments. The threatened abolition of their order, with the organic changes in English social life which will ensue, may excuse some disinclination to concur in the expediency of breaking up hereditary estates. Mr. Brodrick, indeed, has persuaded himself that "no sudden or startling change would be effected by so moderate a reform [as the abolition of settlements and entails] in the characteristic features of English country life. There would still be a squire occupying the great house in most of our villages, and this squire would generally be the son of the last squire. . . . Only here and there would a noble park be deserted for want of means to keep it up." Travellers on the great Continental routes well know that in almost all parts of Europe there is scarcely a gentleman's house to be seen in a hundred miles, though, if they consult books on agrarian reform, they will be informed, perhaps truly, that the peasantry derive a comfortable subsistence from the land. It is true that in France, in the Low Countries, in Western Germany, in Switzerland and Italy, the law of compulsory subdivision, to which, as an English institution, Mr. Brodrick objects, is irrevocably established; but the same constituencies which direct their delegates to abolish entail will, if the custom of primogeniture is found to survive the law, enforce the subdivision which may not have resulted from permissive legislation. It is the opinion of some of the warmest admirers of the agricultural system which exists in the Channel Islands that, notwithstanding the economical advantages which are attributed to petty cultivation, the subdivision of land could not be maintained without compulsory distribution among the children of defunct owners. Mr. Brodrick may fairly decline to be judged by the possible consequences of political measures which are unconnected with his proposals for the legislation of landed property; and he might plausibly contend that moderate reforms would afford the best security against revolutionary change. While he regards with complacency the possible growth of a peasant proprietary, he both desires and expects a more complex distribution of land, involving the retention of estates of various magnitudes, occupied partly by tenant farmers under landlords and in other cases by large and small freeholders. It is to be regretted that a dispassionate inquirer should habitually use the phrases "free land" or "free trade in land," which embody an argument, and which have acquired a controversial meaning. It is not obvious that freedom of dealing with land is identical with new legislative restrictions on its dis-

* *English Land and English Landlords.* By the Hon. George C. Brodrick. London: Cassell, Pether, Galpin, & Co. 1880.

posal. It is true that the accuracy of the term may be defended; but a disputant who wishes to convince hostile or neutral hearers loses more than he gains by prematurely assuming that he is in the right.

In dealing with some branches of his subject Mr. Brodrick has laudably declined to reproduce popular cant. He dwells but little on the alleged inability of limited owners to do justice to their land; and he utterly repudiates the fanciful grievance supposed to be suffered by younger sons of landed families. The cadet who receives but a small share of the hereditary property would have had nothing to share if the estate had not been transmitted to the last owner by his ancestors. Not the owners or the families of owners, but the possible purchasers of land, feel the desire which is now widely repeated—and which, perhaps, is in some instances sincerely entertained—for greater facilities in the transfer of land. It is true that vendors would profit largely by an increase in the number of competitors; and they would also derive benefit from a reduction in the expenses of conveyancing; but only a small minority of landowners wish to sell; and the complication of titles might be abolished by a measure to which Mr. Brodrick has scarcely paid the attention which it deserves. It would be possible, as Mr. Osborne Morgan suggests, to enable trustees to give an indefeasible title, while they would still remain equitably liable to the beneficial owners for the performance of their trusts. Except by the adoption of such a plan, or by Mr. Brodrick's method of abolishing life-estates, no system of registration would materially simplify transfer. The enlargement of the power of trustees would not tend to bring more land into the market, because, with few exceptions, they would decline to transgress the limits of their powers; but the rule that a purchaser need only look to the registered owner would at once render conveyances cheap and secure. The object of increasing the number of landowners which Mr. Brodrick proposes will be generally beneficial, if it can be attained without a social revolution. The morbid appetite of some large proprietors for the extension of overgrown territories has been of late effectually abated through the sudden decline in the value of land. An owner with a half-dozen farms on his hands must, in most cases, be disposed to sell rather than to buy. Lord Cairns's Land Bills of last Session would in many instances have afforded to landowners means of relief, if they had been passed into law; and there can be little doubt that changes still more extensive will soon be adopted. If in any new legislation the vested interests of remaindermen are respected, it will be necessary to give existing life tenants similar powers to those which were proposed by Lord Cairns. Hereafter Mr. Brodrick would convert every life-tenancy into absolute ownership. He would also modify the right of settling land on an unborn eldest son by importing into every settlement of the kind the power of appointment which is usual in settlements of personality. There might probably be some advantage in the additional influence over their children which would thus be given to parents. A younger son selected as heir of the estate, though he would occupy an invidious position, might probably be as good as the first-born; and disturbance of the usual order of succession would probably be infrequent. In the case of peers or of titled families the actual owner would seldom exercise a discretion which could scarcely fail to operate injuriously.

Mr. Brodrick owes something to younger children whose interests he has overlooked, or perhaps deliberately disregarded. While he would allow land to be settled on the unborn son of a contemplated marriage, he sternly prohibits all alternative limitations. Even in the case of settlements already made he doubts whether it would be necessary to respect any interest except that of an heir-apparent. It may perhaps be unavoidable that the contingent rights of cadets should be sacrificed to the paramount object of bringing land freely into the market; but the enlightened reformer displays in this instance an uncompromising regard for primogeniture which is unknown to the actual law. Few settlers are so exclusively devoted to the interests of their heirs-apparent as to be indifferent whether, in default of the eldest son and his issue, the estate should devolve on the next brother. The most creditable, and perhaps the most frequent, motive for founding or continuing a family is a desire to preserve the home to which parents and children are attached. It is usual to provide that the younger sons and daughters should succeed in turn; and in many cases the transfer of the property by the eldest son to a stranger would be unjust or harsh. On a balance of considerations it may perhaps be expedient to discourage or forbid the creation of a series of life estates; but a serious hardship will be inflicted on younger children. Mr. Brodrick may perhaps think that they would gain more by frequent partition of estates than they would lose by exclusion from the benefits of settlement according to the present practice; but, as long as compulsory division is not introduced, English landowners will make strong efforts to prevent the dispersion of their estates. The precedent of the American States, in which freedom of disposal by will exists, is not applicable to England. There would be no use in accumulating landed estates where there are no farm tenants; and there is for this and other reasons no class of country gentlemen in America. Whatever may be the dictates of political or economical expediency, it is painful to look forward to the abandonment and decay of the country houses which are especially characteristic of England. Some compensation might be found for the abandonment of a few country palaces if Mr. Brodrick's rose-coloured pictures of rural life in the future could be accepted

as true to probable nature. He hopes for the revival of parochial administration in connexion with elective bodies in the unions and the counties; and he even persuades himself that in the majority of cases the squire and the incumbent would still principally direct the councils of the parish. Mr. Brodrick's political friends will leave no authority to the squire, and they meditate the early suppression of the parson. Modern government, parochial, municipal, or Imperial, will be exclusively founded on household or on universal suffrage. The landed gentry have already, since the introduction of the Ballot, ceased to influence county elections; and even if a remnant of the class survives the new agrarian legislation, they will be powerless in parishes and in counties. Some of them may be partially consoled for their compulsory abdication by watching the disappointment which awaits the farmers who mutinied at the last general election. The Government which bought their support by promises, and which paid its debt by the Ground Game Bill, has already undertaken to swamp the occupying tenants in the multitude of agricultural labourers. The farmers might have retained political power for a time if they had maintained their old alliance with their natural leaders. They have easily asserted their independence against the landlords; but they will find themselves helpless in future contests with their workmen.

The same class will be largely and not always beneficially affected by approaching changes in land tenure. Mr. Brodrick has good reason for the opinion which he expresses, that large holdings are naturally connected with large estates. If a farm of 800 acres formed the entire property of a single owner, it would, unless he was succeeded by an only child, be subdivided or sold at his death. It is doubtful whether the average extent of farms is at present too large for the most profitable cultivation. The parts of the country in which the rent of occupiers ranges from 50*l.* to 100*l.* a year has suffered less within the last two years than the Midland or Eastern counties; but the comparative exemption of small farmers from distress may be partly attributed to their smaller proportional area of grain cultivation. Except in market gardens spade husbandry is almost unknown in England. The marvellous results of the system in Holland, in the Channel Islands, and in some other parts of Europe, are recorded by Mr. Brodrick with a certain hesitation, though not with incredulity. That a Dutchman living on the produce of eight or ten acres of land should adorn his house with silver plate and with china is surprising; but the fact must be accepted, if it is stated on sufficient authority. If small freeholds are capable of producing similar results in England, the gradations of ownership and occupancy which Mr. Brodrick anticipates will be rapidly merged in a single and uniform community of peasant owners. It will then be useless to regret the total absence from rural districts of almost everything which makes life interesting to educated men.

SHAKESPEARE AND CLASSICAL ANTIQUITY.*

THE translator of this first part of M. Stapfer's *Shakespeare et l'antiquité* remarks truly enough that "the aim of the book is of a purely literary character," and that it "offers no information of an etymological or philological nature." The book is indeed sufficiently differentiated in point of design and of execution from both the styles of Shakespeare criticism which, more or less imitated from German models, have been fashionable of late years in England. It busies itself only in very subordinate measure with the discovery of new points in Hamlet's soul; and with stopped lines, weak endings, and suchlike things it busies itself not at all. It is, in fact—or rather, if it were the work of an Englishman, it might be described as being—a return to the saner and more catholic kind of purely literary criticism, busied at once with form and matter, but less with matter than with form, of which England had in regard to Shakespeare an admirable hierarchy of native practitioners from the time of Dryden to that of Hazlitt, but which has of late years been more or less deserted among us. Miss Carey will probably draw down wrath upon her head from the stopped-liners by insinuating that their favourite style of censure is not correctly to be described as purely literary; but this cannot be helped, and of the propriety of the distinction there is no doubt whatever. Nor is there much doubt that a French critic, if duly qualified by knowledge of English and German literature, is in a position to give criticism on Shakespeare which will have at least a *prima facie* claim to more attention than the work of native critics, because there is greater freshness in his point of view. We do not say that English criticism of Shakespeare is ever likely to reach the point of worthlessness which has been reached by most French criticism on Racine, and by much German criticism on Goethe. There is an innate lawlessness in the literary attitude of the average Englishman which generally preserves him from mere repetition of cut-and-dried estimates, and from mere echoing of affected ecstasies. But the Englishman who tries to talk about Shakespeare is somewhat in the position of the unlucky Eastern poet who was kept for a whole day improvising complimentary couplets to the Sultan. Flatness and sameness are at last unavoidable, and the bowstring has to be got ready.

M. Stapfer's book, we believe, was in substance, if not *totidem*

* *Shakespeare and Classical Antiquity*. Translated from the French of Paul Stapfer by Emily J. Carey. London: C. Kegan Paul & Co. 1880.

verbe, delivered in lectures to the students of the University at Grenoble, where the author is a Professor of Literature. The English Universities do not condescend to such frivolities, and the effect of this tonic abstinence is doubtless to be found in the well-known superiority of the journeywork of English letters. Perhaps, however, though the Grenoble students are to be congratulated on having heard M. Stapfer's lectures, the book as a book would have been a little better had it been originally planned for the press and not for the platform. A certain amount of discursiveness and of repetition, an abundance of quotation, and the citing of authorities for positions which might very well be given at the author's own risk, are things positively desirable in lectures to persons *in statu pupillari*; they are to some extent blemishes in a purely literary essay. However, these defects are by no means sufficient to interfere seriously with the interest and value of the book. Its plan is simple enough. The author has taken those plays of Shakspeare which have classical subjects, and has discussed them *sortim*, expounding their sources, commenting upon their chief peculiarities, and, where possible, comparing them with other work, both ancient and modern, on the same themes. Nor is the selection, as it may appear for the moment, arbitrary and in some sort resembling that of the botanical reformer who proposed to classify plants according to the colour of their flowers. For not only have the classical plays of Shakspeare considerable interest in their bearing on the question of the poet's intellectual equipment, but they illustrate perhaps better than any other class of his plays a point of infinitely greater importance. From the time of Dryden (when the Germans, who vainly boast themselves to have invented Shakspeare criticism, were in a state of literary barbarism) all sound critics have recognized, as the one characteristic of Shakspeare which must never be lost sight of, what may be called his literary transcendence. An Englishman of Englishmen, he is at the same time a man of men, and the extraordinary comprehension of his genius makes the time or nationality of its subjects a matter of indifference. The six or seven plays which deal with classical subjects exhibit this peculiarity, more strikingly and obviously perhaps, if not in reality more strongly, than any others. Here was a man who admittedly knew very little of classical antiquity at first hand, and whose age, learned as it was in a way, did not know very much. We, on the other hand, know a great deal about classical antiquity, and pride ourselves on having discovered its ways and thoughts. Yet, except very foolish people who stumble over the so-called anachronisms, no one can charge Shakspeare with having modernized his Greeks and Romans, with having put Hector's head on Lord Willoughby's shoulders, or clothed Cecil in the garments of Ulysses. His classical characters may not have the correctly and severely appropriate "surroundings" of character and speech that some moderns would give them. But they have the essence, and if they are not Greeks and Romans, there is at any rate no reason why they should not be. A survey of the classical plays cannot, we say, fail to bring this out, and therefore it is worth undertaking as a separate and definite subject of study.

It is needless to say that no critic is likely to endorse all the opinions of another critic, and that still less is an English critic likely to find himself in universal agreement with the utterances of a French brother of the craft. On many points, great and small, we find ourselves at variance with M. Stapfer; but that is natural and unavoidable. We think, for instance, that he is wrong in peremptorily branding *Titus Andronicus* as not Shakspeare's at all; there being much in it that no dramatist of the day save Shakspeare could have written for its goodness, and much of it the badness of which is a specially Shakspearian badness. Such points, however (and we may add to the *Titus Andronicus* question that as to *Pericles*), are hardly those for which one goes to a critic like M. Stapfer for decision. His knowledge of English literature is wide and good; but it is confessedly limited in the matter of the minor Elizabethan dramatists, a full acquaintance with whom is absolutely necessary for the settlement of such questions. Perhaps the most successful, and certainly the most interesting, division of the book is that which deals with *Troilus and Cressida*. Work on this play must always be a labour of love to any French critic, because the charming fable upon which it is based is the undoubted, or all but undoubted, property of a Frenchman. Few things are more curious than the history of the *Troilus* and *Cressida* story and its transformation in the hands of the inventor, Benoit de Sainte More, of Boccaccio, of Chaucer, of Guido Ciononna, and of Shakspeare. Students of old French have of course been for some time in possession of the facts by means of the somewhat verbose, but interesting, preface to the prose romance of *Troilus* in MM. Moland and Héricault's *Nouvelles du 14ème siècle*, and of M. Joly's still more exhaustive and more recent disquisition appended to his edition of the *Roman de Troie*. But the matter has never before been so well laid before merely English readers as in M. Stapfer's chapters. These chapters, moreover, contain much excellent criticism on the various treatment of the heroine by her successive historians. The handling of *Antony and Cleopatra* is also excellent, though hardly so exhaustive and presenting some omissions. Lastly, the chapters on *Julius Cæsar* and *Coriolanus* not unnaturally lead M. Stapfer to discuss the much canvassed question of Shakspeare's political sympathies. He admits (though scarcely with as much decision as he might) that the claim for Shakspeare as an advocate of democracy is baseless, and that he must be set down as of the other persuasion. But the admission is made with some grudgingness, apparently rather because M. Stapfer does not like to limit the area of

Shakspeare's vision to one side of the matter. This seems, however, to overlook the fact that, in the long run, political sympathies are much more a matter of temperament than of reasoning. Few men, indeed, are logical enough or cool enough to push such things back to their first principles. But those who do so push them find themselves confronted at last, in matters political as in matters religious, with certain primary oppositions of principle, equality against inequality, order against progress, &c. &c., on one side or on the other of which they must throw themselves, according to the dictates rather of a kind of political sense or taste than of a balancing of conflicting reasons. Shakspeare beyond all doubt made this journey to the end, and at the end he chose the anti-democratic side.

To criticize criticism is proverbially difficult, the sole way in which it can be done being by means of a tedious and almost unreadable running commentary. We shall therefore only say further that M. Stapfer has supplied English readers with a very thoughtful book of Shakspeare criticism, free not only from the defects already noticed in some other books of the class, but still more from the affectation and "preciousness" of style which have made not a few such books of native origin disgusting to read of late years among ourselves. His translator has done him exceedingly good service. It is, we believe, a popular idea that any one can translate French. The truth is that there is hardly a more difficult language to render properly into English. If the version is not exposed to the special danger of translating from German—the danger of retaining a stiff and ungraceful mould of sentence—difficulties equal in amount, and perhaps more treacherous in kind, are presented by the requisite substitution of equivalent idioms and the appropriate rendering of words which with similar sounds have subtle but very decided differences of sense. For instance, in half the translations of French which are presented to the English public, one single verb, *prétendre*, proves too much for the translator at one time or another. We have hardly noticed a single slip of this kind in Miss Carey's work; and her sentences, with very few exceptions, read as if the language in which they now appear was their native one, and not a substitute for it. Sometimes, indeed, a certain freedom of rendering is used which would shock the strictest school of translators. Thus *rompre visière à*—by the way, *rompre en visière* is, if we mistake not, the more usual form—might very well have been literally rendered "to break a lance with," instead of "to break away from," though the latter happens in the context to be perhaps the more appropriate phrase. However, we are told in the preface that the translation has the full approval of the author, who is himself, we believe, a competent English scholar, so that minute criticism is probably superfluous. It is to be hoped that the reception of this book will encourage Miss Carey to follow it with a version of the second part—"Shakspeare and the Greek Tragedians"—which in its French form was noticed in our columns some time ago. Though (perhaps because) it is fuller of disputable points, it is the more interesting of the two, and contains more original matter.

THE GARDENS OF THE SUN.*

UNDER a somewhat sensational title there is here concealed a good book. It is true that the author undertook a voyage to Borneo and the Sulu Archipelago in the interests of natural history, but a man of education and intelligence could hardly spend months in a land of "perpetual sunshine and copious rain" without seeing and reporting facts more significant than the existence of golden-winged butterflies and gigantic orchids. Mr. Burbidge went to collect specimens for conservatories and museums, but he has added considerably to our store of knowledge about Malays, Chinese traders, Sen-gypsies, Kayans, and Muruts. A preliminary chapter on the outward voyage and the characters of a Welsh stewardess, a photographing stoward, and a quartermaster fond of grog, might very well have been spared; nor is there much of interest or novelty in the account of Singapore. Its hotels, its cookery, and the store and gardens of the late Hon. C. Whampoa, Companion of the Order of St. Michael and St. George, have been described and are well known, and few persons need to be told that a civilian or merchant at that Settlement employs three times as many servants as he would do in England on much less wages; and that provisions are cheap but pianos and luxuries imported from Europe are dear. However, any reader who hastily glances over the first fifty pages will find plenty to detain him in the accounts of travel through scenes vaguely associated with piracy and its suppression by Raja Brooke. Our author went not to subdue and to civilize wild tribes or to negotiate commercial treaties with unimpressible Sultans, but to ransack nature's stores, to shoot strange birds, and to see tropical vegetation in all its glory; and, though his diction is occasionally too technical for ordinary readers, no one can fail to be interested and amused when the ruling passion breaks out defiantly in spite of wet and fatigue, and mosquitoes and leeches. In one place there were rare botanical treasures for which Imperial Kew and Sir William Hooker had longed for in vain. Another was decked with jasmines and hibiscus, with honeysuckles and the sacred lotus, and with the

* *The Gardens of the Sun; or, a Naturalist's Journal in the Forests and Swamps of Borneo and the Sulu Archipelago.* By F. W. Burbidge, Trin. Coll. Botanical Gardens, Dublin, and formerly of the Royal Gardens, Kew. London: John Murray. 1880.

glowing masses of the scarlet *hippeastrum*. On a third occasion, hunger and weariness seem instantaneously to have vanished before ferns of filmy beauty, graceful glumales, and flowery shrubs and palms. And when he ascended Kina Balu for the second time, Mr. Burbidge evidently thought much more of his "nice lot of seeds and plants" than of his feet which he had unluckily scalded by upsetting a hot kettle, or of the view which he might have obtained by a slight additional climb of three thousand feet. But his case exemplifies the difference between Mr. Whymper and other ardent members of the Alpine Club, and Mr. Borrow's Spanish Alcalde, who had lived for forty years at the foot of a high hill without ever caring to go to the top for "prospects."

Mr. Burbidge's wanderings would have read much better had he thought fit to illustrate them by a map. He has given us some good sketches of scenery, of his favourite plants, and especially of the elk-horn fern, besides some aboriginals known as Jakuns or wild men, as repulsive in feature as such noble savages often are. After visiting Jalac, the author went to Labuan and Brunei in Borneo; he then sailed to the small trading station of Sandakan and the Sulu isles, and he ended his tour by ascending the mountain of Kina Balu for the second time. In effecting these objects Mr. Burbidge encountered decided inconveniences and hardships sufficient to raise his journey out of the category of a mere tour. It must be admitted that he was exempt from some perils. There are no tigers in Borneo; wild elephants never molested the party; the relations with the natives were peaceful, and it is quite clear that a residence amongst Malays, Dyaks, and Dusuns would be attended with far less personal peril than a sojourn in Ireland at the present moment. But there were annoyances and pests which would have damped the ardour of a less sanguine naturalist; snakes and leeches abounded; rivers were full of alligators; excessive heat was often succeeded by cold and drenching showers; and the path of the explorers lay through sticky clay and streams soon converted into torrents and rivers which had to be forded or crossed on a buffalo's back. Repeatedly they arrived at a native hut wet to the skin. Now and then they had to sleep under an overhanging rock or a big tree with no other shelter but a waterproof covering. Once Mr. Burbidge and a companion were nearly carried away by the force of the current in a river with huge boulders and a slippery bed, and we are surprised as well as pleased to find that only once or twice did the author suffer from fever. Then, servants and porters who carried provisions as well as treasures culled from the jungle and the hillside and the skins of birds, refused to advance, or were perfectly useless when most needed—they shivered in the cold and had hardly energy left to make a fire and cook their food. However, with tins of chocolate, biscuits, rice, and fowls, the travellers were never brought down to starvation point. Native women were ready to sell them abundance of tropical fruits; solitary Englishmen, the pioneers of civilization, were only too glad to welcome the strangers; and while they could depend on a boiled fowl and a tin of Julienne soup at the close of a long day's trudge, they had no reason to envy the *dura illa* of one of their guides, who roasted a wild cat and two rats and ate them with the liveliest satisfaction.

Not the least attractive part of the book is the visit to the Sulu Archipelago. An introduction to the Sultan led to an invitation to a boar-hunt. The animals were driven out of the jungle by beaters, as in parts of India, with the addition of dogs, and then ridden down by horsemen mounted on ponies and armed with hog-spears. Seventeen hogs were slaughtered in one day, but, though the animals charged once or twice, they seem to have been far inferior to the boar that tests the nerve of the rider over the stony hills of the Deccan or the alluvial flats of Eastern and Central Bengal. The Sulu women, including the Sultana, bestride their horses, have long black hair, and delight in yellow colours. The boar-hunt was followed by a dinner of snowy rice, fish, biscuits, boiled eggs, and curried fowl, excellently served up, with chocolate and brandy; and when the guests retired for the night, the ladies of the zenana indulged a pardonable curiosity by peeping in at them through an opening which led from the audience-chamber to the sleeping apartment. Slavery is still common in these islands, and most of the hard work is performed by women, who go to market and weave mats and baskets while the husbands gossip and lounge. We are rather gratified to hear that the capabilities of the largest island are in process of development by the Spaniards, who virtually rule there. Tobacco is grown largely, besides hemp, cocon, and tapioca; and Mr. Burbidge saw coffee-plants apparently growing wild. A picture of a native craft displays the outrigger familiar to all who have visited Ceylon, but is more comfortable as it has a roof or covering to keep off the sun's rays. The visit ended with a trip to the interior and the ascent of the highest mountain of the island, not more than 3,000 ft. high, during which orchids, as usual, were gathered and pigeons were shot. We must not forget that our author is a zoologist as well as a botanist, and that he was always on the look-out for kingfishers and hornbills, eagles and fish-hawks, and golden plover and snipe. One sentence might lead one to imagine that Mr. Burbidge was careless in the handling of firearms, when he tells us that his servants who had lagged behind were guided to the resting-place by "the accidental discharge of our guns." From the context it is quite certain that the weapons were not let off by accident at all, but for the purpose of drying them, or, as we take it, to see if they would go off after a thorough good wetting. One or two other slight slips occur. The name of a Mahomedan lad should be Jallal-uddin, instead of Jeludin, though the latter may be a Malay

corruption, and when Mr. Burbidge accurately describes the planting out of the rice crop by hand and the careful weeding, he seems unaware that the process is identical with the transplanting of the late rice crop in some twenty or thirty large districts of the Bengal Presidency.

The second visit to Kina Balu, or the "Mountain of the Chinese Widow," had even more of adventure in it than the first. On the previous occasion the route by the Tawaran River was chosen; on the latter, the travellers went up the Tampassuk, which has a strong current and a bar at its mouth. Here they had a difficulty in getting guides, and it seems that previous expeditions have failed from want of a good understanding with the natives. Repeated wettings and nights passed before a wood fire, which was as welcome as if they had been up some mountain in Norway, were compensated by abundance of specimens, and we almost share Mr. Burbidge's emotions on breathing pure mountain air and seeing such remarkable forms of vegetable life as the *Nepenthes Raja* and the *Nepenthes Lowii* and *Edwardsiana*. The *N. Lowii*, we note, is the most singular of the whole group, having urns in the shape of a flagon, and of a hard leather-like consistence. The descent of this mountain was worse than the ascent. Boots split like brown paper; tumbles were frequent; and both Englishman and Malay were heartily glad when the trial of endurance was over. We doubt very much whether a perusal of this record will tempt any of our foremost artists to visit the tropics, as the author suggests, and sketch the delicate tracery of the Nebong palms. Indeed, Mr. Burbidge in one striking passage admits that in this gorgeous wealth of colour and vegetation he saw hardly anything to compare with heather and blue-bells and the buttercups and primroses of our pastures and woods. The burst of a temperate spring is wanting in the East. *Truditur folium folio* may be said with truth of the change of foliage. The eternal verdure is irritating. Leaves, except in some few cases, never fall from the trees, and the new shoots thrust out the last year's crop, giving it no time to wither and shrivel; and so we get tired of a landscape of perpetual aunehine, blossoms, and verdure. The only thing approaching to spring in the tropics is the beginning of the rainy season, when the dust accumulated in the hot weather is washed off by showers that last for six hours at the rate of half or three-quarters of an inch per hour.

This record of travel is fittingly supplemented by two chapters, one on fruits, and the other on outfit, health, clothing, and other points imperative for all who wish to explore with as much comfort as is possible where there are no roads, horses, or rest-houses for the weary. The list of fruits comprises some known in India, and others peculiar to the Malay peninsula. The mango, which in India comes to perfection in June, yields in Borneo two crops a year; and, like oranges, plantains, pine-apples, and pomaloes, must be cultivated sedulously to be worth anything. But other fruits, the *durian*, *rambutan*, *jintawan*, and *langsat*, grow wild, or at any rate come to maturity without "culture," and apparently from sheer excess of "light." Mr. Burbidge agrees with other writers in describing the first named as a fruit with a foul smell and a fascinating taste; if, indeed, the palate can be fascinated by a combination of nectarines and pine-apples, old sherry and cheese, thick cream, apricot, and garlic. The *durian* will not stand a voyage, or it would, like the mangosteen, find its way to Madras and Calcutta. The author justly extols the six segments of white round pulp, which come out of a dark red leathery rind. He adds that the rind of the mangosteen, when dried, has proved of great service in cases of dysentery. The *rambutan* grows in hairy clusters, and discloses an edible pulp of the consistency of jelly with a sub-acid flavour. The *jintawan* is of the size of an orange; and there are other fruits spoken of as acidulous, refreshing, juicy, and eaten by natives in large quantities. The plantain which in the West Indies becomes the banana, is known as the *pisang* in Singapore and Borneo. Mr. Burbidge's hints and warnings to travellers who are liable to drink bad water or to be drenched by heavy rains come with all the weight of one who stayed more than a year in Borneo and picked up a good deal of the language. Flannel next the skin, chlorodyne as a remedy for cholera, and quinine for fever, are his golden rules. We are rather surprised that he did not carry a mosquito-net of green muslin, as he seems to have passed restless nights owing to those insatiate little pests. Moreover, the texture of such a net tends to keep out malaria. Bathing seems to have been a favourite resource, and we should recommend other travellers to follow the author in his precepts rather than his practice, for he indulged in a cold bath when his other remedy of a rub-down with a wet towel would have been attended with less risk. His list of articles for presents to natives or to be bartered for necessities is well selected. Tribes in the interior of the islands are still moneyless, and will take knives and looking-glasses and white and grey shirting, but seem most influenced by ammunition and muskets. A few hints are thrown out as to colonization, but they are more calculated to repel than to invite. There is some good land, with a fair climate, on the lower slopes of Kina Balu, but the rivers are mostly shallow and unfit for navigation, and Borneo is rather out of the highway of commerce. It will be time enough to look out for spare land near Brunei when Johore, Perak, and Queddah have been fully explored. An English Company formed to colonise the northern part of Borneo may possibly calculate on diverting some of the capital which is driven away from Ireland. Up to the present time a Bornean Malay is said to live by lying and thieving; but Mr. Burbidge was never shot at nor had he any difficulty in getting supplies. On one oc-

casion the supposed murderers of a Chinese trader were put to death by the garotte, and when a gold watch and a revolver were stolen from a ship, the goods were recovered and the thieves were punished by the loss of one of their hands—much to the regret of the prosecutors, who had not contemplated or desired such a forcible mode of coercion.

The book would have been better for the addition of the vernacular or common terms for the birds and the botanical specimens, which are literally shrouded in impenetrable folds of learned technicality. But the author is never facetious, funny, or obtrusive; the dedication in the title-page is simple and graceful; and not every one undertaking a toilsome journey for purely scientific objects could have told so much in addition without ever losing sight of his main purpose.

MRS. OLIPHANT'S CERVANTES.*

THIS is the eminently readable sort of work which a novelist of Mrs. Oliphant's skill could scarcely fail to make out of so good a subject as the Life of Cervantes. The story flows easily along, and the character of the hero is clearly conceived and consistent throughout. The biographical part has all the charm and dramatic colour of a novel, more particularly the years of Algerine captivity, which indeed lend themselves to such treatment. The purely literary and critical portion is less happy. The sketches of Cervantes's different works might very well, to our mind, have been omitted, or replaced by general criticism of his method. If the object of the author is to enable the general reader to feel, and on occasion to talk, as if he knew something about works into which he has never even dipped, these sketches are no doubt useful. But perhaps this habit does not stand in need of further encouragement. Yet it is hard to see what other purpose can be served by devoting half of a small page to an account of *La Ilustre Fregona*, as if it were a new Christmas story, and not part of the work of a man who has been a European classic for centuries. And it is impossible for Mrs. Oliphant to do more for his numerous minor works. The inevitable result of this is that the sketches are in many cases quite insufficient, and particularly so in the case of the best works. It is always the character and the thought—things which no sketch can even feebly render—which are the real matters of interest in Cervantes, and the points in which he most differs from his countrymen, with whom incident and situation are everything. Many of his so-called stories—the *Novelas Ejemplares*—are treatises or satires. There is no means of making writings of this class known to people who have not read them except by copious quotation, and from that Mrs. Oliphant is debarred by the limited space at her command. Neither do we think she is always very happy in the passages she does select for quotation. In her account, for instance, of the *Coloquio de los Perros* she quotes at length the somewhat commonplace criticism on pastoral stories, but does not tell the English reader that in this satirical dialogue Cervantes calls loudly for the expulsion of the Moriscos. He attacks them bitterly as a breed of vipers which Spain is nourishing to her own destruction, and hounds his countrymen on to massacre and robbery by holding up the unhappy Morisco as a usurer. We are of opinion that Mrs. Oliphant should have mentioned this fact when arguing against those biographers who have supposed that Cervantes meant to protest against the *autos de fé* in his *Trato de Argel*. But apparently Mrs. Oliphant is no more able than most other biographers to understand that Cervantes was a Spanish gentleman of the sixteenth century, and shared the common hatred of infidels and admiration for the Inquisition. The citation of this passage is partly due also to a theory which Mrs. Oliphant has adopted in a modified form from the French of M. Emile Chasles, and which we will refer to further on. One more criticism is irresistibly suggested by the literary passages of the book. The attempt to convey some idea of *Don Quixote* by two sketchy chapters and a few quotations reaches absurdity. Of all books that ever were written, this is the one in which mere incident is of least importance. Its true charm lies in the endless talks of the Don with Sancho, and the admirable way in which their every thought and action follows naturally from the cupidity of the one and the craze of the other. Mrs. Oliphant's two chapters will be found to be full of suggestions by the reader who brings with him an intimate knowledge of Cervantes; but they will generally be utilized as "cram" by those who are too lazy to read for themselves.

The value of Mrs. Oliphant's criticisms of Cervantes depends very much on the worth of certain theories which she has accepted as to his intentions. We believe these theories to be the results of mere perverse ingenuity. A countryman of Cervantes, the Prince of Borja, laid it down as a general principle that an author's worst enemy is a learned commentator, and, although he was thinking at the moment of Don Luis de Gongora, his dictum applies equally well to the author of *Don Quixote*. Commentators and translators innumerable have undertaken to show that they alone have read the secret meaning of Cervantes; or, worse still, that they knew it better than he did himself. The last, perhaps the most ingenious, and certainly the most readable, of them is M. Emile Chasles, to whom Mrs. Oliphant owes the materials of her little book. We say this advisedly, and almost on her own autho-

rity. She cites nobody else, save when she once or twice names Spaniards quoted by M. Chasles, and Ticknor once; almost all her quotations from the smaller works are to be found extracted and translated in him; and finally she accepts his theories, not indeed wholly, but substantially. Before going further, we would venture to express a doubt how far Mrs. Oliphant knows Spanish. She continually says *auto de fé* instead of *de fé* (a very favourite slip of M. Chasles's), and then she calls the wife of Cervantes Catalina de Palacios y Salazar y Vozmediano. The lady's name was Palacios Salazar y Vozmediano, and the form given to it by Mrs. Oliphant is in any case impossible. She extracts the French biographer's description of Cervantes's house at Valladolid, and explains his inaccurate rendering of the word "cantarera" by saying that it is, "in homely English, a sink." In point of fact, it is a shelf, pierced with holes, in which to place the *cántaros*, or earthen water-jars. These mistakes may appear very trifling, but they are such as no one possessing an accurate knowledge of Castilian would make. It is disappointing to find these and similar errors, and curious that they should be errors already made by M. Emile Chasles. Whatever may be Mrs. Oliphant's knowledge of Spanish, she has only too obviously no knowledge of the Spain of the sixteenth century, its people, its beliefs, or, apart from *Don Quixote*, of its literature.

M. Chasles, who, as we have already said, is originally responsible for Mrs. Oliphant's opinions, is one of those vastly ingenious critics who cannot persuade themselves that so great a writer as Cervantes could content himself with merely writing a story and drawing a character. He must have had some hidden meaning. That Cervantes, being a young married man of very narrow means, should have tried to make money by writing for the stage, and should utilize his personal experience as other men have done, would appear to M. Chasles a totally inadequate, and indeed vulgar, explanation. The *Trato de Argel* was written to persuade Philip II. to make a crusade, the *Baños de Argel* to show how the Oriental harem degrades woman—and so on. In short, Cervantes is subjected to a process of mystic interpretation, with the usual results. Mrs. Oliphant is very far from allowing herself to be run away with by theories in this way. She has clearly felt that M. Chasles was too ingenious to be trustworthy, but her work is so obviously founded on his that it shows numerous traces of his influence. She speaks of Cervantes as landing from his captivity burning, not indeed to preach a crusade, but to rouse his countrymen to some effort on behalf of the unhappy captives he had left in Algiers. Nobody will doubt that Cervantes felt keenly for those who were still suffering, with less lofty courage to support them, the miseries that he himself had gone through. Probably he had some hope that the *Trato de Argel* might be of use to them; but it is impossible to believe that he came back to Spain to begin any such literary war. For the first years after his return he was serving in his former "tercio," and he began by writing the *Galatea*, a pastoral which shows, scarcely a trace of his personal experiences. It is worthy of notice that Mrs. Oliphant does not seem aware that this work is only one of a hundred imitations of the *Diana* of Jorge de Montemayor, which was itself inspired by the *Arcadia* of Sannazaro. Had Mrs. Oliphant indeed treated Cervantes throughout less as if he stood entirely alone, she would have avoided many mistakes. It is, for instance, an utter error to suppose that he was the only Spanish dramatic writer who opposed the development that Lope de Vega gave to the Spanish stage. Cervantes must have been acquainted with the writings of Virues and L. L. de Argensola. It is obvious that he aimed at giving what he thought was a strictly classical form to the drama; he wanted to make it instructive, and his audience wanted it to be amusing. Lope de Vega made it so, and reaped the reward he deserved. This brilliant playwright is far too lightly spoken of by Mrs. Oliphant. He is by no means the merely amusing writer she seems to think, and more than one of his pieces—notably the *Estrella de Sevilla*—has far more real tragic power than all the heaped-up horrors of the *Numancia*. This work Mrs. Oliphant thinks was written to excite a patriotic pride among the Spaniards. It would be far nearer the truth to say that it was written to flatter the already existing passion. But there is no need to suppose that Cervantes did other than give expression in his way to the intense and aggressive national pride which he shared with his countrymen. He failed as a writer for the stage, and deserved to fail, for his pieces, in spite of powerful passages of declamation, are, as plays, very poor.

Of course Mrs. Oliphant has not escaped the temptation to explain *Don Quixote*. It follows from what we have already said that she does not fall into the mistake of supposing it to be a political or social allegory, but her explanation is not much more acceptable. Put briefly, it is that while writing this masterpiece Cervantes was laughing at the follies he himself had committed in his salad days. A similar interpretation is given to Berganza's criticism of pastoral poetry in the *Dos Perros*; and yet the last work on which Cervantes was engaged was in fact a tale of chivalry, and from his deathbed he announced his intention of continuing the *Galatea*. Anything would seem to be more credible to the biographers and commentators of Cervantes than that he knew his own mind. Except for those who have a theory to maintain, it would seem intelligible enough that a work which began as a mere *jeu d'esprit* grew on the hands of its author. There is abundant internal evidence that the intentions of the author underwent a thorough change at least once in the course of the work. He began with the intention of ridiculing the books of chivalry—which had been a general object of ridicule

for a long time—he found that he had created a character, and then saw that he could group round it a whole world of others, and make it a vehicle for his own wit and wisdom and knowledge of men. When he refers to himself it is with an outspoken manly frankness which was too proud to use a veil. By attributing other motives to him, and particularly by accusing him of a probing self-consciousness utterly unlike the man and the time, we take away from the credit due to his art. Of all Spaniards he was the least self-conscious, the most humble-minded, and the most ready to study nature. Therefore, during the greater part of his life he was content to tread in the footsteps of other and lesser men; and also, therefore, the fruit of his ripe experience is the one work in their literature which is of universal interest. There is something almost ironical in the fact that, though he knew *Don Quixote* to be a great work, he thought the *Persiles y Sigismunda* a greater. Mrs. Oliphant talks of the critics who admire this work as showing the “perverse preference of the small to the great, which is the temptation of the critic.” In point of fact, the only critic who has ever done so was Miguel de Cervantes, who, like Milton in a similar case, had that prejudice, and had it to himself. What the Spanish Cervantistas, with whom we could wish Mrs. Oliphant had a closer acquaintance, have done is to consider the mere style as superior to that of the *Quixote*. And on such a question they are the only competent judges.

UNDER ST. PAUL'S.*

THE scene of Mr. Dowling's romance is laid in a private hotel hard by the Cathedral of St. Paul's. The hero, George Osborne, was a broad-chested, good-looking, fair-haired young man, with steadfast blue eyes, who had lately come into a property worth 1,500*l.* a year. These qualifications, though important in themselves, are not enough to make a hero for Mr. Dowling. But Osborne was as great a master of rant as if he had got off by heart all our author's novels. For the first twenty-eight years of his life he had lived at Stratford-on-Avon, and had never visited London till the reader makes his acquaintance in the dining-room of the private hotel. Yet his talk is about anything but oxen. Not even once did he care to ask “how a good yoke of bullocks at Stamford fair.” He was, Mr. Dowling assures us, of a poetical turn of mind. He certainly very often does not talk prose, no more than do the unhappy inmates of a madhouse. It would be hard to believe that a country-bred young man could talk the rubbish that Osborne talks did we not remember how widely the English of the modern novel is spread by our circulating libraries. Even silliness will before long boast of no varieties in England, and the folly of the country will be in all respects the same as the folly of the town. It may be some advantage to fools to be all on one and the same dead level; but those who find some relief in laughing at them will soon have to own that life has become duller than ever. To them Mudie will have done an irreparable injury. We cannot then feel sure that our author wanders far from nature when he represents his Warwickshire hero, in his first days under St. Paul's, talking the rant of the town. We have, however, some right to complain when he gives us three whole volumes of his high-flown rubbish. There is a limit to human endurance. Even your dentist does not attempt to stop all your teeth in one day; but, after an hour or two, lets off the sufferer for a time. Our author would surely do well to follow this good example, and to inflict on his readers not more than a single volume of rant for each story. He may, however, have his admirers, who like his writings so well that they are not satisfied unless they receive a liberal supply. At all events, he should bear in mind his unhappy critics; if he does not, he must not complain when he finds that they can never read one of his novels without flying into a rage.

At the dinner-table in the hotel was a dark-eyed girl, at whom the hero glanced now and then; but when she looked at him, he looked down. Once he came very near to speaking to her. “He cleared his throat, grew red in the face, cleared his throat again, dropped his eyes to his plate, grew still redder, and resumed eating his fish.” These, as the experienced reader well knows, are the signs of a countryman when he is falling into love. So far Mr. Dowling's hero is in keeping with his rustic training. It is only when he opens his mouth that his disguise is at once seen through. The dark-eyed girl, of course, turns out to be the heroine. She might have been thought to be only a chance acquaintance who would open the story were it not for the colour of her eyes. The hero's were blue, as we have said. Such being the case, in accordance with an invariable law, the heroine's were bound to be dark. This young lady—Miss Gordon by name—was anything but shy. She had travelled a great deal, and, as William Nevill—the second hero—justly remarked, was as cosmopolitan as himself. After dinner she confused the hero by asking him what it was that he had been going to say. The very thought that she was curious to know what he had been about to say “flushed him, and made the blood at his wrists tingle. It confused his head, and took his intellect away.” Unfortunately, this was in the first chapter of the first volume, and for all we can see his intellect never returns. Why, by the way, was it at his wrists

that the blood was made to tingle? Into such details as this the novelists of the present day are very fond of entering. It is supposed to show, we believe, a deep study either of their own frames or of physiology in general. But to return to our hero. Deprived of his intellect, he could give no answer to the question, and so went out for a walk. He went on to one of the bridges, where he paused, and said to himself, “What perfume of romance have I drunk that she should make me mad?” As the chapter thereupon ends, there is no answer given to the question; but when we turn over the page we find him still on the bridge, and indulging in a soliloquy that fills a good many pages. “Greater England,” he tells himself, “is my father, but this London is my most beloved sister, of whom I am proud.” He had already visited, he goes on to say, just as if he were a railway-porter bidding passengers take their places, “Birmingham, Coventry, Wolverhampton, Leamington, Warwick, Oxford, Lichfield, Burton, Leicester; but all put together do not equal London.” He then comes back to the young lady of the dark eyes, and proclaims that he has a splendid madness upon him. “I do not want her love. I want only the image as I see it. He [by he is meant William Nevill, a supposed rival] may marry her if he will. I shall never try. I have her image, and neither tyrant nor thief can take that away from me.” He forms a bold resolution, and says that he will “take chambers, and live alone, that is unless I marry.” He walks off the bridge, and straightway lifts up his voice against Sunday traffic. “It ought to be stopped. It could be stopped by law, and it ought to be stopped. Why is it not stopped?” He is, indeed, fond of asking questions, to which he gives no answers. In this he reminds us of a servant-man in our schoolboy days, who was once overheard saying to himself, “Young gen'elmen calls me Peter. My name is William. How comes this ere?” Without a pause the hero resumes his soliloquy by saying, “This is Blackfriars Road. It leads into St. George's Circus, I know from maps, but how different these places are from what I fancied.” What, we should very much like to know, is the fancy that a blue-eyed, fair-haired, poetical countryman forms to himself of Blackfriars Road? He goes on, and presently exclaims, “It is cold. What an idiot I was to come without an overcoat!” A little way further down he takes a whole line to exclaim, “It is chilly.” He presently finds himself at Westminster Bridge, where he declares that the Thames is not only “an imperial highway to the sea,” but is also “the most important piece of water in the world, except the Jordan.” From imperial to important seems such a downfall in words as can only be matched in the language of an auctioneer. He returns to the hotel and is shocked by the heroine's flippancy. “I am so glad,” she says to him, “you have come back to flirt with me.” Well might he think to himself, “What, his divinity speaks thus! Monstrous!” To her he let his thoughts appear only by his manner and his reply. “Shall I light the gas for you, Miss Gordon?” he asked in a cold formal tone. She goes on from bad to worse till he has sadly to allow to himself that she was no longer an enigma or a mystery, but an ascertained certainty, a denounced deception.

In the third chapter she goes out with him for a walk in “a velvet-hat, a full vermillion, with black lace.” He is at once at his old trick of asking himself questions. “What was she really?” This time he does not leave the readers in perplexity, for the beautiful hat, apparently, helped him out of his difficulty. “There was one obvious answer—the most beautiful woman he had ever seen!” They walk round St. Paul's. The better side of her nature was soon seen. The expression of her face changed, and she sighed. He begins to summon up a little power of speaking. “‘You look your loveliest now,’ he said. He thought: ‘Mad or drunk, or mad and drunk, what can I do?’” They begin to talk seriously. She said:—

“Suppose I made up my mind to take a rest, and think seriously of serious things, would you advise me to settle in the country or town?”

He stopped suddenly, raised his right arm, and made a slow gesture round. “What place can you find better than here?” Throwing up his arm to its full height from his shoulder, he added: “Under St. Paul's?”

Matters now go on very rapidly, and he proposes to her in a hansom cab. She says she must take a month to consider, and begs him to send for his sister Kate. This young lady was really much needed, as the heroine had no confidante, and the second hero had no second heroine. With Kate William Nevill at once fell in love, though her brother did not discover it. He still suspected that he was his rival with the dark-eyed girl. The young men on one occasion get confused in their talk through their speaking each of his lady-love as she. The confusion and the chapter are thus brought to a very striking end. “Of whom are you speaking?” asked Osborne. “Your sister.” The two men stood staring mutely into one another's eyes.

The heroine's flippancy is still a great trial to the hero, who, in spite of his turn for rant, was really a highly respectable character. However, she begins to steady down. She goes to a concert. She hears a well-known song. “While she listens she was conscious of some mighty upheaval of her nature. . . . She heard the rumble of some noble thought, but could not figure to her mind its appearance. She knew something great was at hand.” That night she did not go to bed, but sat up in her room motionless as if she still heard “the rumble of the approaching revelation.” Her moral nature is rapidly changed. Under the hero's guidance she even becomes an orthodox member of the Church of England. By this time they were betrothed. Still, he remembers that he may die, and she become a widow:

* *Under St. Paul's. A Romance.* By Richard Dowling, Author of “The Mystery of Killard,” “The Weird Sisters,” “The Sport of Fate,” &c. 3 vols. London: Tinsley Brothers. 1880.

Widows too often marry again, and for her second husband she might have a Dissenter, or even something worse. He makes her take a solemn vow that she will marry no man who does not belong to the faith of the Church. Unhappily for himself, he attends a meeting of the Prehistoric Society, and hears a lecture that was anything but orthodox. Some one lends him a book on Man. He reads it. He exclaims, "What monstrous blasphemy! Man the accidental descendant of the ape! Why is not this book burned by the common hangman?" He has thereupon a dreadful dream and a vision, which together fill thirty-eight pages. He wakes up to find that he had slept more than an hour without coat, waistcoat, or boots. "He put on his coat, waistcoat, and boots. He was low and wretched." A day or two afterwards, he sets out on a wild walk without his breakfast. After some hours, with "an inward shudder," he finds himself at the Zoological Gardens. He goes in, and sees the monkeys. One of the keepers offers to show him some curious animals. He mistook them for negroes; but here we shall let our author speak for himself:—

"In the name of God, then, what are they?"
"Chimpanzees."

Those ruins of the old faith were no longer lifeless. Now over them leaped and bounded ten thousand forms of loathsome brutes. They leaped and danced, and howled and screamed and yelled. They grinned at him and grimaced. They took up the relics of that sacred palace, that holy fane, and smashed and tore and cast them about.

He rushes out of the gardens, and, exclaiming, "On, in God's name, on!" goes along "Bridg Street, Albion Road, Holloway Road, St. Paul's Road, Grosvenor Road, Newington Green Road, Albion Road, Albion Grove, Victoria Road, Church Road." He has by this time ceased to be orthodox. "I belong," he says, "to no Church. I have lost my faith." Of course he cannot keep the heroine to her promise to marry him. It is not at all wonderful that in the last line of the second volume she shuddered.

Everything of course turns out happily at the end, but it is not till the close of the third volume that the difficulties are overcome. We had not patience enough to follow the hero through all his perplexities, for his rant at times became overpowering. We were satisfied with knowing that we had not to take leave of him as an heretical and most melancholy bachelor, rushing wildly along all the roads mentioned in the London Directory. He is last seen by the reader spending his honeymoon in that most quiet, respectable, and orthodox among sea-side towns—Bournemouth.

ILIOS.*

ILIOS is perhaps the worst arranged book that ever came under our notice. Admirable as a discoverer, a digger, a diviner of ancient sites, Dr. Schliemann is an astonishingly bad writer. We gratefully acknowledge the intensity of his love of Homer, and his invaluable services to archaeology. But, when he writes a book, Dr. Schliemann exhibits himself as a most inconsistent reasoner, and withal as a wordy, unstable person who does not know his own mind. We do not find fault with Dr. Schliemann for not being an accomplished scholar or a trained archaeologist. He is something better; he is a man of real genius. No one but a genius could have lived the life Dr. Schliemann describes in his autobiography, keeping always before his eyes the ideal of Homeric research. This journal has not been grudging in its welcome of Dr. Schliemann's discoveries; but his discoveries are one thing and his new book quite another. It is necessary to speak quite plainly, because the volume has been praised as an example of argument and arrangement. Before we have done with it, we think that Dr. Schliemann's claims to these merits will be exploded. But first we must admit that Dr. Schliemann has hardly given himself a fair chance as a writer. He is entangled helplessly in the ranks of his allies and camp-followers.

Agamemnon scarcely brought more allies to the siege than Dr. Schliemann leads to the "discovery" of Troy. The list of scientific names in his title-page reminds one of the "Catalogue of the Ships," otherwise called the "Ravotia," by the ancients. Dr. Schliemann has received notes from his friends, notes on various topics, and he casts them down very much at random in the pages of *Ilios*. One short letter of Professor Sayce's, about an emblem near the image of Niobe (who does not wear turned-up-toed boots after all), is quoted twice by Dr. Schliemann in different parts of his volume. Prince Bismarck is quoted as to the Trojan manner of making big pipkins, which pipkins, by the way, are like those used before the arrival of Europeans by the natives of New Caledonia. There are long digressions about the *swastika*, concerning which we wish we had space to say many things. There are pages upon pages from the *Times* about the bits of jade, in face of which Professor Max Müller had a "feeling of giddiness," because he recognized in the chips the portable property of our Aryan ancestors. One of Dr. Schliemann's advisors, Professor Maskelyne, takes the view advocated in these columns, that the jade arrived in the West by way of early commerce. But these digressions tempt us to digress by the force of bad example, and

our object is to show the condition of Dr. Schliemann's mind as to the significance of the objects he has discovered.

First, we must ask, What are these discoveries? To this there is a ready answer in the preface, and other scattered contributions of Professor Virchow, who has visited the excavations. First, then, on the surface of the eminence of Hissarlik are remains of the date of the third century after Christ. From twenty to thirty feet beneath lie *strata* after *stratum* of relics of human existence. These *strata* are each said, by Dr. Schliemann and Herr Virchow (with a protest), to represent a "city," though the term city might just as well be applied, on Professor Virchow's own showing (p. 314), to a collection of the huts of the existing peasantry in the Troad. Among these *strata* the third, at the depth of thirty feet or more, shows signs of having been consumed by fire, and this *stratum* Dr. Schliemann and Herr Virchow both call Ilium. And this is the point where a fallacy makes its appearance. It was natural enough that Dr. Schliemann, in the excitement of discovering the pots, plates, cups, and ornaments lately exhibited at South Kensington, should have identified the barbaric dwellings with the Ilios of Homer. He found Homeric palaces, the Scwan gates, the treasures of Priam, and heaven knows how many other relics of Troy. But Dr. Schliemann has grown partially wiser. He knows, when he stops to think about it, that the burnt village is not Homer's Ilios. He knows that Homer described the civilization of an age infinitely more advanced. Thus (p. 517) he writes, "I wish I could have proved Homer to have been an eyewitness of the Trojan war. Alas! I cannot do it." Yet time after time he uses Homer as if he had been an eyewitness or had lived in an age of similar civilization. Dr. Schliemann does not know his own mind. On p. 517 he admits that swords were of universal use in Homer's time, and that iron was known, "whereas they were totally unknown at Troy. Besides, the civilization he describes is later by centuries than that which I have brought to light in the excavations." A more cautious archaeologist would not, of course, have said "later," but "more advanced." It may be maintained that the remains at Hissarlik are Celtic or Galatian relics, much later in time than the Homeric age, though much more backward in culture. We do not ourselves hold that opinion, but there is nothing in it inconsistent with possibility. Degenerate or undeveloped races succeed races comparatively advanced, and this might conceivably have occurred in the Troad. But to return to Dr. Schliemann. While he admits that Homer spoke of facts only as tradition instructed him, and introduced the manners and civilization of an advanced age into the story of distant times, he still persistently uses Homer as an eyewitness or as a contemporary. If he does not mean Homer to be an eyewitness or a poet living in a contemporary civilization, why does he choose words out of Homeric epics to apply to the relics of the burned town? A gold ornament Dr. Schliemann styles *πικτή ἀνὰδωρη*; a cup is *δέπας ἀμφικύπελλον*; and the gold earrings with pendants are *θύσανοι*. Where is the point in using Homeric names for articles which Homer, by Dr. Schliemann's own admission, is likely to have known nothing about? Any other Greek names would have answered as well. Dr. Schliemann actually says:—"If, in spite of its exhaustion by a long process of siege, the third city of Hissarlik was still so rich that I could find in it ten treasures, this is an additional proof of its identity with the poet's Ilios." This is the very point which Dr. Schliemann admits that he cannot prove. But, on the very next page, Dr. Schliemann says it is probable that, if Homer ever visited Hissarlik, he found the Æolic Ilium already long established, with two, or perhaps three, cities buried and forgotten between it and "the Homeric Ilios." How is one to argue with a writer so reckless as Dr. Schliemann? He appears to imagine that minute points of history would remain in tradition, and that the technical terms for certain ornaments and utensils would abide unchanged while four cities of men arose each on the ruins of the other! It is another question entirely when Dr. Schliemann uses his so-called "owl-headed idols" and jurs to explain the Homeric epithet *γλαυκῶπις*. If ever *γλαυκῶπις* was a ritual word, meaning "owl-headed," it might have survived in poetical language long after its significance was lost. Again, as the oldest image of Demeter was certainly horse-headed, there would have been nothing remarkable in an image of Athene with the lineaments of her favourite bird. In most early religions we find gods of this sort. Where an anthropomorphic god succeeded to a totem, or a number of totems, it was natural that he should retain some of the attributes of the creatures whom he superseded. Professor Otto Keller, one of Dr. Schliemann's countless allies, speaks of the "non-Hellenic attribute of the mouse," which was sacred to Apollo Smintheus. He adds, with the easy complacency of his school, "the mouse loves the heat of the sun, and so it prospers under the rays of Phoebus Apollo." The hippopotamus loves the rays of the sun, so does the cat, so does the dog and the kangaroo. The house-mouse sees less of the sun than any of these animals. The fact is that every great god in the Greek Olympus has his animal attributes and animal forms. The tribes that had claimed descent from the bear, wolf, bull, cow, and so on, came to suppose that the she-bear, the wolf, the bull, the cow were Artemis, or Apollo, or Zeus, or Hera, in animal shape. These ideas, though historically demonstrable, have no place in the philosophy of Dr. Schliemann and his allies. We have no objection to an owl-headed Athene. But we do object to Dr. Schliemann's method when he calls the rude beginnings of representations of the human features "owl-heads," and when he calls primitive net-sinkers

* *Ilios: the City and Country of the Trojans; the Results of Researches and Discoveries on the Site of Troy and throughout the Troad in the years 1871-72-73-78-79.* Including a Biography of the Author, by Dr. Henry Schliemann, F.S.A., F.R.I. British Architects, Author of "Troy and its Remains," "Mycenæ," &c. With a Preface, Appendices, and Notes. By Professors Rudolf Virchow, Max Müller, A. H. Sayce, J. P. Mahaffy, H. Brugsch Bey, P. Ascheron, M. A. Postolucas, M. E. Burnouf, Mr. F. Calvert, and Mr. A. J. Duffield. With Maps, Plans, and about 1,800 Illustrations. London: John Murray. 1880.

"owl-headed idols." Last summer an American student from Ohio visited Dr. Schliemann's collection, and in his "owl-headed idols" detected the little weights of stone which are commonly found on the banks of American streams, and are relics of the Red Indians, or some other race of men who weighted their nets with those objects. In this big book of Dr. Schliemann's, a reply to the sceptical American may possibly exist, but we have not detected its presence.

The owl-headed goddess has led us away from Dr. Schliemann's permanent intellectual muddle. We have seen that, in his opinion, Homer visited Hisarlik, if he visited it at all, when three or four later cities covered the Ilios of the great leaguer. By that time we may presume that the manner of funeral rites may have changed since the burnt city fell. Indeed, on Dr. Schliemann's own theory, this must have been the case, for the mode of burial of the royal dead at Mycenæ was absolutely unlike the frequently described funeral rites of the epics. Dr. Schliemann says (p. 517) that Homer "clothes the traditional facts of the war and destruction of Troy in the garb of his own day." Very well, then his account of the burial of Patroclus and Achilles cannot be evidence as to the real funeral of these heroes, supposing that they ever existed. We might as well look for ancient British customs in Malory's account of the burial of Launcelot. But Dr. Schliemann is so illogical and inconsistent as to use Homer actually, one may say, as an eyewitness when he discusses the funeral of Patroclus. Homer does not actually say that the ashes of the hero were deposited in his tumulus. "Had it been deposited, or had it been destined to be deposited, Homer would not have kept back from us the important fact. Consequently the tumulus of Patroclus was a mere cenotaph" (p. 649). But, as Homer lived after four new cities in succession covered the ashes of Ilios, what value can his evidence have on a point of this kind? It could only be valuable if Homer had either fought under Troy, or conversed with Achæans, who did fight on the plains. Otherwise, and especially by Dr. Schliemann's own showing, it is worthless. In this same passage the Doctor wildly declares that the twenty-fourth books of each epic are "universally acknowledged to be later additions." The Alexandrian critics, or some of them, doubted the authenticity of the twenty-fourth book of the Odyssey, chiefly for a reason which is now seen to prove rather the authenticity than the late character of the rhapsody. As to the twenty-fourth book of the Iliad, we refer Dr. Schliemann to the *scholia*. They sufficiently disprove his statement that it is "universally acknowledged to be a late addition." We have read some such opinion, advanced by Professor Sayce, in the Proceedings of the Oxford Philological Society. But Professor Sayce is not everybody, and only if he were everybody could Dr. Schliemann speak with truth about the universality of the belief that the book is late and spurious. Lastly, if it is late, and if it is spurious, and if the poet, as Professor Sayce seems to hold, knew nothing of the geography of the Troad, why does Dr. Schliemann use the twenty-fourth book as good geographical evidence about the Troad when it agrees with his ideas (p. 92)? With this final and, we hope, conclusive example of the muddled state of Dr. Schliemann's mind, we leave his work, with a well-deserved compliment to the illustrations, to its repose.

CAUSERIES FLORENTINES.*

M. KLACZKO may be congratulated upon a field of interest and pursuits so wide that he can turn from the *Two Chancellors* to such subjects as those with which he deals in the present volume. The names of Bismarck and Gortchakoff suggest very different associations from those which are connected with Dante, Petrarch, and Michael Angelo. But the writer who so recently was exploring the highways and byways of Russian and German policy now takes his pleasure, in cauntering over the over new pastures of Italian poetry and art, and has produced a very readable and agreeable volume. The machinery so often employed for conveying opinions so as to represent some variety of conclusion is not very happily managed. A select party of interlocutors is supposed to assemble at the villa of a lady in the environs of Florence, and to instruct and amuse each other in a series of conversations. The device is an old one, and there is little attempt to give an air of *véraisemblance* to the proceedings. Some of the speakers prelect for pages in succession, and are only interrupted by another speaker interposing with a quotation which might just as well have been made by the personage in possession of the ear of the company. No one will be surprised that the book opens with a visit to the Bargello, and a discussion upon the well-known fresco portrait of Dante. Thence the party adjourns to the villa of the Countess, and the talk begins by her asking if any one can explain the "tragedy" of Dante. This kind of aiming at the novel and unexpected is perhaps rather too frequently repeated. Because the poet's great work was called by himself a "Commedia," and has ever since borne that name, coupled with the adjective which he could hardly have used himself, but which to modern thought serves to qualify his own part in the title, it is imagined that a point can be made by calling his life a Tragedy—which it is not, any more than his poem is a Comedy, in the present sense of the word. Then a question is made whether the self-imposed exile of Byron from his own country may not be compared in its sufferings and bitterness with that of the great Florentine

partisan; while Milton, Cervantes, and Tasso are also cited as instances of poets who were unfortunate in the circumstances of their lives. Michael Angelo is named as the only other person in the domain of art who has exercised the same fascination of agony upon the world; and a somewhat elaborate comparison between the two Florentines follows. Both, no doubt, had misfortunes in their lives, and both were great artists; but it does not require any long consideration of the career of the two men to see how entirely different were the nature and the causes of their respective troubles. Neither can it be affirmed with truth that the painter drew his inspiration from the poet; and on this point M. Klaczko has placed some excellent disquisition in the mouth of one of his speakers, and well describes the very different positions which the two occupied in the history of literature and art. Michael Angelo stands apart from all other painters of his time in breaking away from the traditions of Christian art; he resorted to the Old Testament for his subjects rather than to the New; he placed no aureoles round the heads of his sacred personages, and clothed none of his figures with wings; he mingled sacred and classical associations; but not, as Dante did, in equal reverence for the accepted traditions of both. The poet accepted the Church as he found it, only desiring to confine it to what he held to be its proper spiritual functions; he did not venture to question the authority of Aristotle and the Schoolmen, and transferred to his verse the theology and logic of Thomas Aquinas. To him Chæron and the Furies and the other tormentors and characters of Virgil's infernal regions were as real as the beings whom he introduced from Sacred Writ and the hagiology of the Catholic Church. The painter was vague and impersonal; his cartoon of the "Battle of Pisa" is a study of soldiers surprised in bathing, in attitudes arranged so as to develop their designer's consummate knowledge of the human form in muscular action; but it has no special relation to the time or place of the victory the memory of which it was commissioned to perpetuate. He scorned to preserve a likeness to the originals of his iconic statues, alleging that it was his business to create great works of art, and that to posterity it would be all the same whether they resembled their originals or not. Dante, on the other hand, is precise, real, and personal. The *Inferno* and *Purgatorio* are planned and mapped to scale, as accurately as if the work had been, as to its dimensions, executed by a professional surveyor. Time is as carefully observed in the progress of the poem as is space in laying down the stage and erecting the scenery of its action. Every person mentioned is one and individual—the very same man in his place of torment or purgation that his fellow-citizens had been accustomed to meet and converse with on the banks of the Arno, or as he was known in history or literature. Everything is exact, nothing is general.

One is less disposed to agree in the writer's opinions when he declares, or at least makes one of his supposed guests declare, that the decline of art down to the days of Caracci, Guercino, Domenichino, and so forth, was a consequence of Michael Angelo's "Last Judgment." In the development of all things there is a succession of stages, which may generally be considered as leading up to the highest perfection of which a thing is capable, and falling away again from this to a condition of greater or less inferiority, ending with the cessation of existence. This is the case with races of animals and plants, as well as with single specimens of those races; with nations and political constitutions no less than with individuals; and it is also the case with literature and art. To fix the point of culmination in art has always been more difficult than to determine it in the history of literature. Noblemen and gentlemen who made the grand tour in the last century would bring home with infinite satisfaction Carlo Dolci and Carlo Maratta, as the finest examples of Italian art, and would indeed have been surprised to hear of a preference for pre-Raphaelite pictures; but to pronounce that Michael Angelo wrote the *Memo Tekei* of the Renaissance on the walls of the Sistine Chapel is to say that which will hardly obtain much assent, and perhaps was not intended to do so.

It is interesting to observe the way in which an acquaintance with English literature, no less than with English phrases, is now advancing on the Continent, and an amusing specimen of it is afforded when M. Klaczko applies the name of "whipper-in" to Cato of Utica, in his function in the *Purgatory* of superintending the souls as they arrive on its shore. Whether the phrase first became known out of England from the hunting-field, or in its applied Parliamentary sense, could hardly be traced. A quotation is immediately afterwards made from one of Macaulay's essays, where he observes that Dante is the only modern poet whose use of the Greek mythology is neither puerile nor pedantic. There is much ingenious fancy and some truth in the view taken of the *Inferno* as giving prominence to what may be called a sort of "fauna" of its own. These are the three allegorical beasts at the opening, Cerberus, Geryon, the Centaurs, and other forms of strange animal life. While in the *Purgatory* the "flora" is more especially brought forward, as in the beautiful valley where the kings are found reposing, and in the cloud of flowers which surrounds Beatrice near its end. In the *Paradise* there is no survival of terrestrial life; light and music alone appeal to the eye and to the ear. But when it is suggested that the *Inferno* leaves a plastic, and the *Purgatory* a picturesque, while the *Paradise* makes a musical impression, one can only feel desirous of escaping from the company of a commentator so fantastical.

The second imaginary conversation is devoted to Beatrice and the poetry of love. The inevitable comparison is introduced between the celebrated loves of Dante and of Petrarch. No doubt can

* *Causeries Florentines*. Julian Klaczko. Paris: Plon. 1880.

reasonably be entertained that Beatrice and Laura were both women of flesh and blood, whose parentage, birth, and lives are as well known as those of the most familiar personages in history. Neither of them was a metaphysical or theological abstraction. But here the resemblance ceases; the child-love for the little girl of nine years old in the crimson frock was the glory and the purification of Dante's life; she became a part of all his philosophy and all his poetry, the root and centre and sustaining presence of it all. She pervades it all; it begins and ends with her; and the influence thus given is ever one of exaltation and virtue. The *Vita Nuova* is entirely occupied with her; in the *Convito* Dante explains the rules by which his writings are to be interpreted, and reports the story of his love, affirming that his poetry is still inspired by his recollections of her. He explains that, on losing her, he was incapable of consolation except by the study of philosophy, and in this way took place the allegorical fusion of a new mistress of his intellectual life with the old love of his youth. Then, in his great work, Beatrice is again still more elevated in position, and becomes the representative of theology and his divine guide through the regions of eternity. How different from all this is the affair of Petrarch with his Laura! Like many other of the world's great ones, Petrarch began life as a man of fashion, and it was as such, and at the age of twenty-three, that he first saw Mme. de Sade, who had then been married for a couple of years. From this time she became the object of his idolatry, and the subject of all those sonnets which, as Lord Byron has so justly observed, would probably never have been written if she had been his wife. But it was the fashion to have an ideal or mythical mistress, and the man of letters delighted himself, while he also made himself intensely miserable, by endless outpourings of affected grief and never-ceasing agonies of unrequited attachment. As Mr. Henry Reeve has remarked, it is clear that his tenderness, even if real, was sustained by the pleasure it gave him to transmute it into well-turned verse. Foscolo had previously seen that the love of Petrarch for Laura was, in truth, not of an ennobling character, and that it was in effect a contest of unworthy desires with continuing and justly deserved disappointment, colouring his existence with morbid feelings, and leading to nothing great or good, beyond being the pivot on which some of the finest, but also some of the most artificial, poetry that was ever written is made to turn.

One of Klaczko's speakers is made to call Petrarch the first man of modern times; but one of the excuses for adopting a conversational form in writing is the license it affords to say that for which the author does not wish to make himself altogether responsible. Foremost Petrarch certainly was in his own field and in his own time, and vastly is the world of letters indebted to him for the work performed by him in the reintegration of ancient literature. It is to be regretted that no selection has ever been made and published from Petrarch's letters, now so well edited and in course of translation into Italian, and to be obtained in a more convenient form than the bulky old folios of Basle and Venice. Their Latin is the nervous and playful language of a man to whom it was still a living tongue in daily use, and they can only be matched for interest and animation with those of Cicero. M. Klaczko compares the familiar correspondence of Petrarch to that of Voltaire, and notes that the enormous influence exercised by him on his contemporaries can only be appreciated by making acquaintance with it.

Returning to the poetry of love, it is gratifying to find that the company assembled at Florence are made to do full justice to Shakespeare, as one of the greatest of those who have contributed to it. In *Romeo and Juliet*, especially, the true spirit of the South is caught and maintained, and tenderness and fervency of passion is expressed in language which goes beyond the finest efforts of the school of the Troubadours. Too precise a comparison is attempted when the opening of the fifth scene in the third act of this play is likened to an *aubade*; and it is hardly necessary to say that the modern reader would know more than he generally does of that species of composition if the professors of the Gay Science in Provence and in Italy had been the authors of such works as Shakespeare's plays.

In the third and fourth sections of the *Causeries Florentines* are more particularly discussed the relations of Dante with the Catholic Church and the political bearings of his actual career and his writings. Rossetti's strangely perverted views are combated, and the poet is shown to be, what he in fact was, a thoroughly orthodox son of the Church, giving to it as entire a loyalty in spiritual matters as he contended should be given to the Emperor of his idea in matters of purely temporal government. He was neither a Manfred nor a Faust, but an eminently conservative thinker and worker, so far as the broken opportunities of his distracted life allowed him to be a practical worker in the politics of his time. His grand ideal of one Empire and one Church could scarcely have been brought into the domain of reality under any circumstances of favourable action; nor was his personal temperament of a kind to make him a successful leader or associate of men engaged in forwarding a great political movement.

M. Klaczko cites Milton and Klopstock as two Protestant poets who have chosen sacred subjects as their themes—names which should not be placed together, except when under the bracket of their common Protestantism; but the *Messiah* of the latter does not meet with much favour at the hands of the assembled guests at the Florentine villa; and the advantage enjoyed by Dante, as a fervent Catholic, in carrying on his poem to the sublimest joys of *Paradise*, is justly contrasted with Milton's comparative failure

in his *Paradise Lost*. The well-known lines from the Sixth *Æneid* are quoted to show that the ancients had a purgatory of their own; and Witte's theory of the unity of the so-called Trilogy of Dante is discussed—a theory to which we have already indicated entire adhesion, but which M. Klaczko is inclined apparently to dispute, and not now for the first time. The *New Life*, the *Banquet*, and the *Divine Comedy* form unquestionably parts of one whole conception, and cannot indeed be thoroughly understood if read apart from each other.

DARWIN'S POWER OF MOVEMENT IN PLANTS.*

MR. DARWIN'S latest study of plant life shows no abatement of his power of work or his habits of fresh and original observation. We have learnt to expect from him at intervals, never much prolonged, the results of special research in some bypath or other subordinated to the main course of the biological system associated with his name; and it has been an unswerving source of interest to see the central ideas of the evolution and the continuity of life developed in detail through a series of special treatises, each well nigh exhaustive of the materials available for its subject. It is in the department of plant life that he has of late years devoted himself to working out the laws which govern the whole realm of vital phenomena. That these laws in their origin and ultimate operation are common to plant and animal alike has long formed a characteristic principle or axiom of his philosophy. In the experimental study needed for the elaboration of the vital processes and the making good the resulting generalizations, the kingdom of plant life offers decided advantages beyond that of animals, if it were only that observations of this class are free from all possible taint of inhumanity. Mr. Darwin has in the quietude of his hothouse, and with a boundless variety of forms for selection, experimented upon the vital organism of plants, seconded by the untiring energy and patience of his son. Night and day seem to have come alike to the aid of this enthusiastic pair of naturalists. The electric light has served them on the failure of the sun's beams, and has in truth opened up of itself a wholly new field for observation as regards the agency of light upon the phenomena of life. To the vista of knowledge revealed by these experiments upon the elementary processes of life in movement, growth, nutrition, respiration, sensation, and so forth, imagination can set no bounds. It is impossible, Mr. Darwin remarks at the close of his record of these interesting experiments, not to be struck with the resemblance between the foregoing movements of plants and many of the actions performed unconsciously by the lower animals. This analogy has been made the subject of much interesting investigation by Sachs, Frank, and other leading biologists on the Continent, and we may expect that the highly original and elaborate experiments recorded in the volume before us will give fresh stimulus to this most important course of investigation, laying as they do a new and more solid basis for the comparative study of plant and animal life. Plants, of course, possess neither nerves nor a central nervous system, and there is consequently lacking in them that which gives its most distinctive character to animal life as a whole. Yet that sensitive impressions are present in plants, with the power of movement in obedience to the stimulus thereby imparted to the organism, may be held to be conclusively shown by facts such as those produced by Mr. Darwin. Most striking of all, however, as a point of resemblance, is the localization of their sensitiveness, and the transmission of an influence from the excited part to another, which consequently moves. May it not be inferred that in animals the nervous structures serve merely for the more perfect transmission of impressions and for the more complete intercommunication of parts? From the earliest sign of germination in plants—namely, the protrusion of the radicle from the seed-coats under the soil—there is manifest a sensitiveness to external influences, with a movement in response to the conditions of light or pressure, and so forth, which is not sharply to be distinguished from the rudimentary intelligence in animals. In the sensitive point or tip of the radicle, which we might compare with the antennæ in insects, there is to be seen an organic power equivalent, in a lesser degree, to the action of the brain in the lower animals:—

We believe that there is no structure in plants more wonderful, as far as its functions are concerned, than the tip of the radicle. If the tip be lightly pressed or burnt or cut, it transmits an influence to the upper adjoining part, causing it to bend away from the affected side; and, what is more surprising, the tip can distinguish between a slightly harder and softer object, by which it is simultaneously pressed on opposite sides. If, however, the radicle is pressed by a similar object a little above the tip, the pressed part does not transmit any influence to the more distant parts, but bends abruptly towards the object. If the tip perceives the air to be moister on one side than on the other, it likewise transmits an influence to the upper adjoining part, which bends towards the source of moisture. When the tip is excited by light (though in the case of radicles this was ascertained in only a single instance) the adjoining part bends from the light; but when excited by gravitation the same part bends towards the centre of gravity. In almost every case we can clearly perceive the final purpose or advantage of the several movements. Two, or perhaps more, of the exciting causes often act simultaneously on the tip, and one conquers the other, no doubt in accordance with its importance for the life of the plant. The course pursued by the radicle in penetrating the ground must be determined by the tip; hence it has acquired such diverse kinds of sensitiveness. It is hardly an exaggeration to say that the tip of the radicle thus endowed, and having the power of directing the movements of the adjoin-

* *The Power of Movement in Plants.* By Charles Darwin, LL.D., F.R.S., assisted by Francis Darwin. With Illustrations. London: Murray, 1880.

ing parts, acts like the brain of one of the lower animals; the brain being seated within the anterior end of the body, receiving impressions from the sense-organs, and directing the several movements.

In a suggestive passage, with which our authors bring their present course of investigations to a close, we see opened up a far-reaching prospect for the biological progress of the future. For the present it must suffice to have made good so much as our authors have been able to report from their patient study of the simpler and more easily observable vital phenomena. There has always been something mysterious in the power of movement to be noted in plants, whether periodical or incidental. An astonishingly small stimulus is found to be enough in most cases, and the difficulty with our authors lay in devising means of sufficient delicacy to appreciate or to measure the degree of motion. Even in the case of allied plants, one may be found highly sensitive to the slightest continuous pressure, another as responsive to a slight momentary touch. The most widely prevalent movement is essentially of the same nature as that of a climbing plant, which bends in succession to all points of the compass, hence named "circumnutation." Instead, however, of simply revolving on an axis, the plant-stem is growing at the same time, and its apex consequently tends to describe a circular spiral, or irregular ellipse. At times the apex travels backwards in a zig-zag line, or makes small subordinate loops or triangles. Until recently the cause of all such bending movements was sought for in increased growth on the side which becomes for a time convex; but the experiments of Sachs and De Vries have led to the conclusion that this cause is but secondary, the movement of circumnutation being primarily due to the increased turgescence of the cells on either side, together with the extensibility of their walls. On however small a scale, every growing part of every plant is continually circumnating, as the whole volume before us tends to show. Even the stems of seedlings, before they have broken through the ground, as well as their buried radicles, circumnate to the extent allowed by the pressure of the earth:—

In this universally present movement we have the basis or groundwork for the requirement, according to the requirements of the plant, of the most diversified movements. Thus, the great sweeps made by the stems of twining plants, and by the tendrils of other climbers, result from a mere increase in the amplitude of the ordinary movement of circumnutation. The position which young leaves and other organs ultimately assume is acquired by the circumnating movement being increased in some one direction. The leaves of various plants are said to sleep at night, and it will be seen that their blades then assume a vertical position through modified circumnutation, in order to protect their upper surfaces from being chilled through radiation. The movements of various organs to the light, which are so general throughout the vegetable kingdom, and occasionally from the light, or transversely with respect to it, are all modified forms of circumnutation; as again are the equally prevalent movements of stems, &c., towards the zenith, and of roots towards the centre of the earth. In accordance with these conclusions, a considerable difficulty in the way of evolution is in part removed, for it might have been asked, how did all their diversified movements for the most different purposes first arise? As the case stands, we know that there is always movement in progress, and its amplitude, or direction, or both, have only to be modified for the good of the plant in relation with internal or external stimuli.

A great part of Mr. Darwin's work is taken up with the details of experiments for measuring the quantity and direction of motion in plants, both under natural and artificial conditions. Direct observations have been made in numerous cases under the microscope, and in others use has been made of delicate apparatus of various kinds. Minute bits of card or tissue paper have been attached to the radicles, filaments, or terminals of stems, and tiny particles of metal or beads of shellac have been employed as weights to test the power of rigidity or of sensitiveness in the fibres of plants. Pins stuck in the soil around the stem have served to mark the conduct of the plant when impeded in its growth or its spontaneous habits of movement. The movements of the tenderest filaments or leaflets have been made to trace themselves in lines upon smoked glass. A series of diagrams has in this way been worked out, and set before the eye in numerous woodcuts, generally magnified two or three fold, showing the general law of circumnutation indefinitely modified by special conditions. The differences of movement in seedling and mature plants, in monocotyledons and dicotyledons, with the indications of certain movements having been acquired for a special purpose, are pursued through widely contrasted classes of plants. The circumnating powers of young leaves are described in thirty-three genera belonging to twenty-five families, widely distributed amongst ordinary and gymnospermous dicotyledons, and amongst monocotyledons, together with many cryptogams. Here the seat of movement is generally seen to lie in the petiole, but sometimes both in the petiole and the blade, or in the blade alone. The movement is chiefly in a vertical plane; yet, as the ascending and descending lines never coincide, there is always some lateral movement, resulting in irregular ellipses, so that the motion becomes really one of circumnutation. It is interesting to mark the periodicity of leaf-movement, a gentle rise being observed in the evening and the early part of the night, with a sinking towards morning. In *Dionaea* and certain graminæ a strange jerking and oscillatory movement is to be seen under the microscope, curiously contrasted with the immobility of the tentacles of *Drosera rotundifolia*, which are yet sensitive enough to curl inwards in twenty-three seconds so as to absorb a bit of raw meat. The distinction of epinastic and hyponastic growth—according as the growth takes place more rapidly in the upper or lower surface of an organ, causing it to bend downwards or upwards respectively—introduced by De Vries, has been illustrated in the case of a number of plants. To Frank is due the introduction of the useful

terms of "heliotropism," for the tendency to turn to the light, with its correlative "apheliotropism," the opposite tendency, occasionally to be observed, "geotropism," for the bending towards the earth, and "apogeotropism," expressing motion in opposition to gravity or from the centre of the earth. For the measurement of movements, sometimes excessively minute, various expedients were adopted. Dots were made from time to time upon sheets of glass placed vertically and horizontally near the plant, these dots being then copied on tracing paper and joined by ruled lines, arrows being added to show the direction of the movement. The plants were exposed to varied conditions of light, sometimes being wholly protected, the light at other times being admitted from above or from either side. In addition to the sun's rays, the electric light was made the subject of experiment, with results comparable with those of Dr. Siemens. A valuable chapter is given to the sensitiveness of plants to light, with its transmitted effects. That growth in general is checked by light, which acts upon plants much in the same manner as it does upon the nervous system in animals, is a statement which needs to be reconciled with the undoubted fact that the power of bending to the light is beneficial to plants, and may in all probability have been specially acquired under the action of natural selection. Experiments have abundantly shown that growth is exceptionally promoted by light continuously kept up, as in the Polar summer, or when the absence of sunlight is compensated by the electric ray. Herein is, of course, involved the intricate problem of the sleep of plants, which is carried on through two chapters of the highest interest.

What is called the sleep of plants, which was observed as early as the time of Pliny, and was brought under scientific discussion by the famous *Somnus Plantarum* of Linneus, presents hardly any analogy, as our authors are careful to premise, to the sleep of animals. This is doubtless owing to the absence in plants of a cerebral or nervous system, which needs to recruit its powers by periodical repose. The term "nyctitropism" is to be preferred for the so-called sleep-movements of plants. As a result of very numerous and varied experiments, it is to be inferred that in these movements we see the general principle of circumnutation modified by the alternations of day and night, or, strictly speaking, of light and darkness. That they are to a certain extent inherited seems to be shown by most plants habitually resuming their proper diurnal position in the morning, although light be excluded; as well as by their leaves continuing to move in the normal manner in darkness for a day or so at least. A long list of all the genera known to include sleeping plants is given in Chapter VII., differing in some respects from that of Linneus. The nyctitropic movements of leaves and cotyledons, which are distinguished with great minuteness, are effected in two ways; first, by means of the pulvini (cushions or joints) becoming, as Pfeffer has shown, alternately more turgid on opposite sides; and, secondly, by increased growth along one side of the petiole or midrib, and then on the opposite side, as was first proved by Batalin. These movements often range through an angle of 90°, being more rapid in the evening, the cotyledons in some cases moving vertically upwards at night, while the leaflets move vertically downwards. The advantage resulting from such changes of position is shown to be the protection of the upper surface from being chilled by radiation, experiments proving the ill effects produced when leaves were pinned down so as to be unable to assume their natural nyctitropic position. The same purpose is seen to be subserved by the imbrication of sleeping plants for mutual protection—a very common phenomenon. The mere closing of the petals of flowers at the close of the day, it is to be observed, does not come under the head of sleep. It is due, our authors believe, rather to the fall of temperature than to the failure of light. In their remarks upon the movements excited by light, note is taken of the difference first pointed out by Sachs between the action of light in modifying the periodic movement of leaves, and in causing them to bend towards its source—the latter, or heliotropic, movements being determined by the direction of the light, whilst the periodic movements are affected by changes in its intensity, not in its direction. The phenomenon of apheliotropism, or negative heliotropism, when a plant unequally illuminated on the two sides bends from the light, is comparatively rare, our authors only having observed it in the cases of *Bignonia capreolata* and *Oryclamen Persicum*. Among the extremely few plants which show no trace of heliotropism they mention *Drosera rotundifolia* and *Dionaea*. The pitchers of *Sarracenia* have also been found by Sir Joseph Hooker insensible to a long-continued lateral light. There can be no doubt that the primary and ruling agency in all plant movements is that of light. We look forward with deep interest to the prosecution of researches which may penetrate still further in this direction.

THE GRANDIDIERS.*

THE GRANDIDIERS, although it bears a French name, is an exceedingly favourable specimen of a German novel. There is none of the tediousness, of the looseness of plot and vague inconsistency of purpose, which too often annoy us in these productions, and yet there is no lack of the realistic pictures of society in which the German novelists excel. Herr Rodenberg tells his

* *The Grandidiars: a Tale of Berlin Life.* By Julius Rodenberg. From the German by William Savile. London: Sampson Low & Co.

animated story with an engaging spirit; he draws characters that range from the commonplace almost to the ideal with the firm touch of assured conception; and in his incidents he alternates between the grave and the gay, illustrating the life of his countrymen in many of its varieties. It is true that he confines himself almost entirely to men and women of the middle and the lower orders; merely glancing casually at such prominent public characters as the Emperor William and his great Chancellor. The local colouring is always effective, and generally sufficiently faithful to nature, making allowance for the strongly patriotic prepossessions that paint Berlin as a city of delights, and its precincts as a reflection of the earthly Paradise. After all, we are bound to remember that he usually places these excusable sentiments in the mouths of born Berliners, who have had few opportunities of correcting their ideas by making comparisons abroad with their Thier Garten and their boulevard under the lime-trees. Some of his characters are eccentric enough—eccentric, indeed, to the verge of impossibility, so far as the freedom of their manners are concerned, and the complacency with which their vagaries are tolerated. But, independently of the fact that the social manners of Berlin are as far removed from those of London as the Spree is from the Thames, Herr Rodenberg has infused so much of human nature into his extravagances that we are inclined to admit that at the worst he can merely have been guilty of exaggeration. There the talent of the accomplished artist shows itself; the talent of a man who is largely gifted with imaginative power, and with a quality which is still rarer among the novelists of the Fatherland—that of a humour which is apt to break out into drollery. We know not whether Herr Rodenberg has French blood in his veins, although the subjects of his novel might almost suggest as much. But he is French on other points besides his *esprit*; and his manner of treatment occasionally reminds us of Balzac. This is the case not only with some of his more superficial touches, as when he makes the head of the Grandidiers, who is a worthy hatter of Berlin, revive the Oriental decorations of a banquetting room in his antiquated mansion, and dine with many refinements of luxury under a ceiling glittering with Venetian mirrors; but also with the minuteness of analysis he carries out in his characters, and in the subtle delineation of seemingly inconsistent traits, which nevertheless are perfectly conceivable combinations, as is demonstrated to our satisfaction in the sequel by the consistency with which they are sustained. There is art, too, in the delicately ingenious manner in which he often partially withdraws for the benefit of his readers the veil which habits of reserve and unconscious deception have dropped between his personages and the general public. Nor is the interest of the story merely social. Latterly the painter of cockney manners becomes effusively and eloquently patriotic. The war with France has broken out; the minor rivalries and jealousies of citizens of the different German States are forgotten in presence of the common danger; persons who are humble, insignificant, or even grotesque, are inspired by the contagious fervour of patriotism to acts of sublime sacrifice and self-abnegation. We are transported from Berlin over the broad Rhine plains into Alsace, where by a very remarkable series of undesigned coincidences we meet almost all our old Prussian acquaintances; and we are invited to assist at some of those painfully dramatic scenes that followed the siege and surrender of Strasburg.

Herr George Grandidier, the head of the Prussian family of the name, is a typical man. He is a prominent member of the flourishing French colony descended from the Huguenots who had taken refuge in Berlin after the revocation of the Edict of Nantes. He cherishes a sentimental affection for the country that exiled his fathers and for his French kin; but his real devotion is for the land in which his fathers have been naturalized. The special object of his unbounded gratitude and affection is the illustrious memory of the "Great Elector," who had thrown his protection over the family fortunes. Herr Grandidier is one of those men to whom we have alluded, whose nature is made up of reconcilable contradictions. Essentially generous in thought as in his actions, he is obstinately narrow-minded in certain matters. With an intense capacity for loving some special objects of affection, he permits his feelings as it were to get frozen over, in such a way that not even his nearest or dearest suspect anything of the warm temperature below the ice. (On that most distinctive feature of his idiosyncrasy—his strength or his weakness, as we may please to call it—hinge the incidents that form the chief framework of the plot. Grandidier has an only son, in person all that can gratify a father's eye, and otherwise a boy of no ordinary promise. Grandidier is devoutly grateful to Providence for the magnificent destinies in store for the child. The heir of at least three generations of Grandidiers and hatters will succeed to the magnificent business they have made. It is his obvious mission to develop the business even further—a worthy object of ambition that might satisfy the aspirations of any man. And trivial as are Herr Grandidier's trains of thought, and ludicrous as his dreams appear to be, Herr Rodenberg has contrived it so that we never cease to respect the man. When he shows himself most harsh and unforgiving in the bosom of his family, we know that he is suffering more than anybody else, and are persuaded that he will either make atonement in the end or expiate his fault by some terrible penance. For it is very slowly borne in upon his mind that the hopes of his life are doomed to be disappointed. His son Edward has shown perverse Bohemian tendencies from his school days upward. Even as a boy he always shunned the joys and triumphs of the hat factory. By preference he mingled in the games of the street Arabs who

haunted the somewhat disreputable quarter in the neighbourhood of the workshop. Subsequently he took to spoiling cardboard and hat-boxes with ridiculous pencil scratches. In short, Edward was a born artist, who yielded at last with some reluctance to the irrepressible bent of his genius, and showed himself in an unflinching way at least as obstinate as his father. It is only the congenial spirit who afterwards becomes his wife who is able to read clearly in a self-painted miniature of the young man, the evidences of an ethereal artistic nature in the firmness, listlessness, and dreamy irresolution that are blended in his expressive features. Possibly he would never have taken of himself the most momentous step in his life. He is urged on to it by a strong-minded counsellor, whose mania is interference in the affairs of everybody. Edward leaves his father and Berlin at a day's notice, starting for Paris to push his fortunes there. That tardy decision once taken, he proves himself resolute enough. All the dogged energy of his Huguenot ancestors comes out—the energy of the men who had suffered all things for conscience sake, and yet never despaired of their fortune or suspended their efforts in business. He pursues his studies and gets a living somehow, till his talents are recognized and rewarded. When his foot is fairly on the ladder of fame, he climbs fast. His pictures make a general sensation, and he receives the highest honours of the art academies. He comes back to Berlin, covered with his laurels, to seek the reconciliation which is refused him; and to receive Princes of the Blood and the highest potentates of the State in the very studio that had witnessed his youthful struggles. In all probability, nevertheless, Edward and his worthy father might have died as inimical as they had lived. The reserves of paternal affection, indeed, are inexhaustible; but those of the son have almost run dry under the strong and overbearing sense of hard injustice. It is the war, with its events and anxieties, that brings the two together. The father learns to respect the conduct of his son, making all the while heroic efforts to hold back from advances to him. But when the son has gone to the war the strain on the old man becomes terrible; and, when his Edward has been wounded and brought to death's door, he throws down his arms and surrenders at discretion. The scenes of the reconciliation, with those that follow, are admirably touching in their quiet simplicity.

Far the best and most amusing of the comic characters is Herr Scharf, though he decidedly oversteps the borders that separate portraiture from caricature. A man of extraordinary sense, courage, and presence of mind, he is as extravagant in his fashions of behaviour as original in his habits of thought. He is the most genial of Red Republicans and revolutionaries. He has given himself, without the slightest claim to it, the brevet title of colonel; for his original calling was that of a barrister. He has made friends all over the world, from Paris to Constantinople; and in the latter capital, indeed, is so intimate with the men in power as to be able to obtain Osmanli decorations for his acquaintances. What is most remarkable about him, however, is a serene imperturbability of self-assurance, which not only never belies itself, but always succeeds. Even strangers treat him at first sight as a privileged person who may do and say anything. He calls the ladies to whom he takes a special fancy—in all honour, be it understood—by their Christian names, nor do they or their husbands take the liberty amiss. Having made the acquaintance of the Grandidier family, by bringing them bad news as to one of their near connexions abroad; having interested himself in the troubles of Edward Grandidier, because like himself he seemed to fly in face of the conventionalities, it is but natural that "the Colonel" should court the responsibility of advising the young man to break with his father, and manfully follow out the line of his predilection. But, to do Herr Scharf bare justice, it is not his practice to shrink from the consequence of his counsels or to throw his *protégés* overboard. And we are disposed to read the secret of the mysterious influence he exercises in the instinctive perceptions it is his privilege to awaken of the generosity and nobility of nature that underlie his conspicuous oddities. Among other humorous studies of Herr Rodenberg are two ancient servitors of the Grandidier household, who reign supreme in their respective departments, though they are naturally indulgent to the wishes of a master who has treated them with unflinching liberality and kindness; while Herr Grandidier, autocratic and tyrannical as he can be, behaves to them in a spirit of *camaraderie*, consulting their prejudices and fancies, very often to his own inconvenience. Altogether, *The Grandidiers* is capital reading; and Mr. Savile seems to have done his share of the book with equal fidelity and judgment; at all events, his translation appears to preserve the full flavour and spirit of the original.

NOTICE.

We beg leave to state that we decline to return rejected Communications; and to this rule we can make no exception.

The SATURDAY REVIEW is duly registered for transmission abroad.

Nearly all the back Numbers of the SATURDAY REVIEW may be obtained through any Bookseller, or of the Publisher, at the Office 38 Southampton Street, Strand, W.C., to whom all Communications relating to Advertisements should likewise be addressed.

Now ready, **VOLUME L.**, bound in cloth, price 16s. Cloth Cases for Binding all the Volumes, price 2s. each. Also, Reading Cases, price 2s. 6d. each. May be had at the Office, or through any Bookseller.

THE SATURDAY REVIEW

OF

POLITICS, LITERATURE, SCIENCE, AND ART.

Price 6d.

CONTENTS OF No. 1,815, JANUARY 8, 1881:

The Queen's Speech.—Ireland.
The Queen's Speech. The Revolt in the Transvaal. The Russians in Central Asia.
The Last Speeches of the Recess. Epping Forest. Jews and Germans.
Citizen Blanqui. The Employers' Liability Act.

Winter Wildfowling.
Fossilism and C. tract. Pulpit Pencilings in the P. M. G.
The Recrudescence of Feudalism. Roman Catholic Statistics in England.
The Sabre. The Prospects of the Money Market.
Winter Exhibitions. The Cup at the Lyceum.

English Land and English Landlords.
Shakespeare and Classical Antiquity. The Gardens of the Sun.
Mrs. Oliphant's Cervantes. Under St. Paul's. Illos. Cusaries Florentines.
Darwin's Power of Movement in Plants. The Granddiggers.

CONTENTS OF No. 1,814, JANUARY 1, 1881:

The Morality of the Platform.—The New Year and the Session.—The Transvaal Rebellion.—The Trial of the Agitators.—Eastern Affairs.—The *Atlantic* Report.—Judicial Recreations.—Thuringian Landowners.—Epping Forest.—French Prosperity.

Memoir of Charles John Herries.—Oliphant's Land of Gilead.—Queen Cophteta.—Hall's International Law.—Talbot's Greece and the Greeks.—Two Foreign Novels.—Siberia in Europe.—French Literature.

London: Published at 38 SOUTHAMPTON STREET, STRAND, W.C.

ADVERTISEMENTS.

THE GROSVENOR GALLERY.

WINTER EXHIBITION.

The GROSVENOR GALLERY Exhibition of Water-Colour Drawings, and Decorative Designs, by living Artists, NOW OPEN
Daily, Ten to Six.

Admission, 1s. Season Tickets, 5s.

DORÉ'S GREAT WORKS, "CHRIST LEAVING THE PRÆTORIUM," "CHRIST ENTERING JERUSALEM," and "MOSES BEFORE PHARAOH," each 33 by 21 feet, with "Dream of Pilate's Wife," "Christian Martyrs," &c. at the BOULE GALLERY, 26 New Bond Street. Daily, Ten to Six. 1s.

PRELIMINARY SCIENTIFIC EXAMINATION.—UNIVERSITY OF LONDON.—A CLASS in all the subjects (including practical work) for this Examination is held at St. Bartholomew's Hospital, continuing till the Examination in July. The Class is open to Candidates who are not students of the Hospital, as well as to Students, and will begin on Tuesday, January 18.
Botany.—Rev. G. Henslow, M.A., Christ's Coll., Camb., Lecturer on Botany to the Hospital.
Zoology.—Norman Moore, M.D., St. Cath. Coll., Camb., Lecturer on Comparative Anatomy to the Hospital.
Chemistry.—H. E. Armstrong, Ph.D., F.R.S., Demonstrator of Chemistry.
Physics.—Donald McAlister, D.A., Fellow of St. John's Coll., Camb., Demonstrator of Physics.

Fee for the whole course (including Chemicals), to Students of the Hospital, 28s.; to others, £10 10s.
Particulars may be ascertained on application, personally or by letter, to the WARDEN of the College, St. Bartholomew's Hospital, E.C. A Handbook forwarded on application.

WILTS and HANTS AGRICULTURAL COLLEGE, DOWNTON, Salisbury.—For intending Landowners, Land Agents, Farmers, Surveyors, and Colonists. THE ONLY AGRICULTURAL COLLEGE IN GREAT BRITAIN PROPOSED IN A FARM.
SPRING TERM begins January 25.—For Prospectus apply to the PRESIDENT.

HYDE PARK COLLEGE for LADIES, 115 Gloucester Terrace, Hyde Park.
The JUNIOR TERM begins January 10.
The SENIOR TERM begins January 30.

Prospectuses, containing Terms, Names of Professors, &c., can be had on application to the LADY RECTRESS.

SAINT PAUL'S SCHOOLS.—About TWELVE SCHOLARSHIPS will be Awarded next Term. For information address CLERK to Governors, Mercers' Hall, E.C.

D O V E R C O L L E G E.
President—Earl GRANVILLE, K.G.

A Chapel and another new Boarding House have recently been completed. Each Boarder will now have a separate Bedroom.
The 2nd place for Cooper's Hill, entries for Woolwich, Sandhurst, &c., have been obtained during the last year.
Tuition from 13 to 18 Guineas. Board, 24s. 6d.
For particulars apply to the Rev. W. DELL, M.A., the Head-Master, or W. KROOKER, Esq., the Honorary Secretary.

MINGTON COLLEGE. The NEXT TERM begins early 28th. Scholarships lately gained at Balliol, Queen's, Clare, Trinity Hall, &c. the Hertford. Twelve Certificates in July last in Public Schools Examinations. In the Junior School Boys are admitted at the age of Eight, and are prepared for Scholarships in this and other schools. Special attention paid to the elementary instruction of little boys.—Apply, Rev. Dr. Wood, College, Exnington.

B R I G H T O N C O L L E G E.
The NEXT TERM will commence on Tuesday, January 25, 1881.
F. W. MADDEN, M.R.S., Secretary.

ISLE OF WIGHT PROPRIETARY COLLEGE, Limited.—Head-Master, the Rev. F. D. TEESDALE, M.A., Scholar of Winchester and New College, late Head-Master of the Northern Counties College, Inverness. The TERM will commence on Friday, January 28, on which day it is expected that all the boys will be at the College at 9.30 A.M.—All particulars may be obtained from the Secretary, W&A, The Cottage, Melville Street, Ryde.

S. PAUL'S COLLEGE, STONY STRATFORD.—Warden-elect—Rev. H. W. McKENZIE, Kettle Coll., Oxford, late Sub-Warden of S. Paul's. A PUBLIC SCHOOL in accordance with Church of England Principles. Terms, Sixty Guineas.—Full particulars on application to the WARDEN. The NEXT TERM begins January 15.

STRATFORD-ON-AVON.—TRINITY COLLEGE SCHOOL.—The Warden, RICHARD F. CURRY, M.A., is assisted by Seven Resident Graduate Masters. Special attention paid to Modern Languages, Classical and Modern Literatures. Junior Department for Young Boys. Exhibition to the Universities. Large Playing Fields, Gymnasium, Five Courts, &c. Terms, 50 and 60 Guineas. Apply to the WARDEN.

BRUCE CASTLE, TOTTENHAM.
Head-Master—Rev. W. ALMACK, M.A.

The main features of this School are its extreme healthiness, convenient buildings, and extensive grounds (30 acres), its system of education (which provides for special as well as ordinary requirements), and the thorough domestic care and organisation. Few schools have greater natural advantages.

PERCEVAL HOUSE SCHOOL, BLACKHEATH, S.E.
Principal—WM. KIESER, M.A.

The NEXT TERM will commence on January 25.

ST. EDMUND'S COLLEGE, SALISBURY.—A HIGH-CLASS SCHOOL for SONS OF GENTLEMEN. The religious training is upon definite Church principles. Boys are educated with much care and thoroughness. They receive individual teaching and help wherever needed. Candidates for Matriculation at the Universities are specially prepared. Terms, £75 a year.—For references, prospectus, or any further particulars, apply to the Warden, Rev. G. H. BOURNE, D.C.L.

PREPARATION for the UNIVERSITIES, for the Naval, Military, East Indian, and Civil Services, for the Preliminary Examinations, for the Legal and Medical Professions, and for Mercantile and other pursuits. Head-Master and Chaplain, the Rev. J. WHITE, M.A., late Head-Master of the Oxford Military College, and formerly Instructor in Mathematics at the Royal Military Academy, Woolwich. LEAST TERM commences on January 18.—Particulars as to Cadetships, Exhibitions, Scholarships, Prizes, Medals, Terms, successes of former Pupils, &c., may be obtained of the Secretary.
By Order of the Council,
ALFRED EAMES, Secretary.

Royal Naval School, New Cross, S.E., December 1880.

TONBRIDGE SCHOOL.—Founded by Sir ANDREW JUDD, A.D. 1552. For Particulars of an Examination for SEVEN SCHOLARSHIPS on January 24, 1881, EXHIBITIONS, &c., apply to the Rev. T. B. ROWE, M.A., School House, Tonbridge. The New Scheme of the Charity Commissioners for the administration of this School is now in force.
By Order of the Governors.

MORNING PREPARATORY CLASS for the SONS of GENTLEMEN (exclusively), 13 Somerset Street, Portman Square. The LENT TERM will commence Monday Morning, January 17.

CARSHALTON HOUSE SCHOOL, Surrey.—BOYS carefully prepared for Civil and Military Examinations.

STIFFORDSBRIDGE, MALVERN.—Thorough PRIVATE TUITION, in a large country house, is offered on moderate terms to a few GENTLEMAN'S SONS willing to read.—Address, J. G. LAWTHORPE, M.A. Oxon.

ABINGDON SCHOOL, Berks (Six miles from Oxford), offers at much lower cost the advantages of the larger Public Schools, a thoroughly sound Education, a healthy atmosphere, and excellent Accommodation. Apply for entrance next Term, and full particulars, to the Rev. E. S. JAMES, Head-Master.

CHIGWELL GRAMMAR SCHOOL, Founded 1620, on the borders of Epping Forest, offers a sound EDUCATION on the system of the Modern Schools of the Public Schools.—Apply to Rev. R. D. SWALLOW, M.A., Head-Master.

EDUCATION IN FRANCE.—Monsieur MONCHIATRE, the French Protestant Minister of Elbeuf (half-an-hour from Rouen), receives into his family a few YOUNG ENGLISH GENTLEMEN for EDUCATION, especially with a view to the acquisition of the French Language for the Civil Service and other Examinations. Special arrangements can be made with Masters for Music and Drawing. M. MONCHIATRE can refer to the following Ladies and Gentlemen whose Sons have been under his care:

Sir Joseph Favrer, 16 Granville Place, Portman Square, London.
George Selon, Esq., 25, Brompton, Green Hill, Edinburgh.
Mrs. Armstrong, Widow of the Rev. John Armstrong, Rector of Diulder.
Monney Hopkins, Esq., St. Michael's Buildings, Cornhill, London.
Mrs. Niekman, 22 Leicester Square, Haymarket.

FRANK COOPER, M.A. Oxon., prepares a few PUPILS for the Public Schools. The House, expressly enlarged, stands close to the sea, on gravelly soil, between Bournemouth and Lymington. References given and required.—Address, Kivnells, Milford, Lynton, Hants.

ROYAL ARTILLERY.—Rev. C. B. DRAKE, M.A., is able to offer to CANDIDATES for WOOLWICH the special advantages of residence at Cambridge. House life. Numbers strictly limited.—Address, 15 Queen Anne Terrace.

WOOLLEY GREEN, near ROMSEY.—A. M. HEATHCOTE, B.A. Oriel Coll., Oxford, prepares BOYS, between Seven and Fourteen, for the Public Schools, &c. Masters for French, German, Music, Drawing, and Drilling. Quite in the country; good air. Number of Pupils, under Twenty. Terms, £13 to £150. Prospectus, with all particulars, on application to A. M. HEATHCOTE, Esq., Woolley Green, near Romsey.

A FIRM of CHARTERED ACCOUNTANTS have a Vacancy for a PUPIL CLERK, who will receive special time and instruction in Bookkeeping from a Principal. Premium, 150 Guineas, half of which will be returned in salary.—Address, F.C.A., N. 205, Inquiry Office, "Times" Office, E.C.

CHARLES E. CURTIS, Member of the Inst. of Surveyors, Professor at the White and Harris Agric. College, and Author of "Estate Management," may be CONSULTED personally or by Letter, on matters relating to ESTATE IMPROVEMENT.—Address, Deansway, Alton, Hants.

TO ARCHITECTS and SURVEYORS.—A JUNIOR ASSISTANT desires RE-ENGAGEMENT. Neat draughtsman, good and quick tracer and writer, fair colourist, thoroughly acquainted with the general office routine. Three and a half years' experience with a good architect. Full references, and specimens given.—Address, H. G., 25 Elford Road, Drayton Park, Ilkley.

JANUARY ELECTION, 1881.—SEVENTH APPLICATION.

ORPHAN WORKING SCHOOL, Haverstock Hill, N.—An Earnest Appeal is made to the GOVERNORS and SUBSCRIBERS for VOTES and Interest on behalf of GEORGE STEEL HOLMAN, the youngest of three Orphans, aged Six, Ten, and Twelve years. Both Parents are dead. The Case is strongly recommended by G. A. SPOTTISWOOD, Esq., New Street Square; J. P. DIXON, Esq., 60 Fleet Street, E.C. Proxies will be thankfully received by Mr. J. T. RUSSELL, 25 Wellington Road, Cold Harbour Lane, Camberwell.

BRITISH ORPHAN ASYLUM, Mackenzie Park, Slough.—For the Orphans of those once in Prosperity, of all Denominations and from every part of the British Empire. The Institution is supported entirely by Voluntary Contributions. The Committee most earnestly APPEAL for FUNDS to meet present liabilities.
H. SYKES THORNTON, M.A., F.R.S., Treasurer.
CHARLES WOOLLOTON, J.P., Chairman.
ALFRED MACKENZIE, Secretary.

Bankers—Messrs. Williams, Deacon, & Co., Birch Lane, London and the Manchester and Salford Bank, Manchester. Offices, 47 Cannon Street, E.C.

HIS Royal Highness the DUKE of CONNAUGHT and STRATHMAY, K.G., has graciously consented to PRESIDE at the ANNUARY FETTERAL of the BRITISH ORPHAN ASYLUM, Mackenzie Park, Slough, to be held at Willis's Rooms, King Street, St. James's, on Tuesday, March 1, 1881. Noblemen and Gentlemen willing to act as Stewards at that occasion are requested to intimate their desire to the Secretary.

Office, 47 Cannon Street, E.C.

ALFRED MACKENZIE, Secretary.

MERSEY DOCK ANNUITIES.

THE MERSEY DOCKS and HARBOUR BOARD hereby give Notice that they are prepared, in accordance with the Provisions of their Acts of Parliament, to receive applications for PERPETUAL ANNUITIES, having the effect of Permanent Stock, on the basis of 25 lbs. per Centum per Annum.
For particulars application may be made to the Treasurer, Dock Office, Liverpool.
By Order of the Board,
EDWARD GITTIN, Secretary.

Dock Office, Liverpool, Dec. 22, 1880.

THE AMENDMENT TO THE ADDRESS.

IT is probable that the support of Mr. PARNELL's Amendment by English and Scotch Radicals is not to be exclusively ascribed to disregard of justice and humanity. One of many dishonest peculiarities of faction is the habit of relying on its own anticipated failure to attain its professed objects. A malignant minority, knowing that it will be outvoted, sometimes takes the opportunity of earning cheap popularity without causing corresponding danger to the State. Few of the opponents of Mr. FORSTER's Bills seriously approve of a state of society in which the habitual torture of women is only one among many familiar incidents. It is difficult to believe that Englishmen of decent character and position think it better that the Land League should enlist unwilling recruits by terror and cruelty than that a rational procedure adapted to the circumstances should temporarily supersede the ordinary law. Even if any other members agreed with Sir WILFRID LAWSON that it would be better to abandon Ireland than to reduce it to obedience, the cowardly disruption of the Empire is not immediately in issue. As no party has proposed for the present Session a Bill for the evacuation of Ireland by English authorities, they must in the meantime be allowed to discharge the ordinary function of protecting life and property. The Irish members have not succeeded in persuading the House of Commons that the prevailing anarchy is a newspaper fiction. Some of them displayed a maladroitness which is perhaps natural in their illustrations of the alleged tranquillity of Ireland. One member had recently, in company with a mob, met a tenant-farmer who had incurred the displeasure of the Land League, and yet, as their leader boasted, the man was not murdered, nor even maltreated. Another member contended that Mr. Justice FITZGERALD could not have spoken the truth as to the existence of anarchy and disorder because the Judge himself had been seen walking with impunity two or three miles from Cork. Some opponents of coercion may perhaps be actuated by incurable revolutionary prejudice; but their more astute confederates know that the Bills will be passed, and only hope by affectionation of resistance to influence the Government against the landowners. It has been alleged in the columns of the organ of the extreme Radicals, not only that a number of Liberal members are associated for the purpose of putting pressure on the Government, but that certain Cabinet Ministers countenance the movement, in the hope that it may strengthen them in the chronic struggle with their colleagues. It may be hoped that in this instance party passion may account for a charge which attributes the basest conduct to the writer's political friends. Mr. GLADSTONE's guarded language on the first night of the Session is already represented as a proof that the Government Land Bill will be weak and insufficient. An obscure section of London agitators under the presidency of the well-known Mr. BEAL has announced that any measure which is likely to pass the House of Lords will fail to satisfy public expectation. It is, perhaps, not in Mr. GLADSTONE's power, if it coincided with his will, materially to modify the provisions of a measure which must almost certainly be the result of a compromise. The practice of voting steadily with the PRIME MINISTER is constantly inculcated on the moderate section of the Liberal party as the whole

duty of Parliamentary man. It seems unfair that the Radicals should not be bound by the ethical code which they have imposed on their neighbours.

Mr. PARNELL, in his audaciously temperate speech, coolly informed the House of Commons that the question between the landlords and tenants was one, not of life, but of money, and that the sum in dispute only amounted to 5,000,000*l.* out of a rental of 15,000,000*l.* The statement failed, as might be expected, even to approximate to the truth; for the 10,000,000*l.* which, according to Mr. PARNELL, the tenants are willing to pay, corresponds to GRIFFITH's valuation, which has been repudiated wherever it equals or exceeds the stipulated rent. It was so unusual to hear from Mr. PARNELL language not ostensibly provocative of social and political anarchy, that some members of the House of Commons perhaps thought for a moment that he was proposing a compromise or basis of negotiation. The Greek Ministers are equally considerate when they offer to submit to arbitration on condition that the award shall coincide with the decision of the Conference of Berlin. Mr. PARNELL and his associates have again and again told the Irish occupiers that they were to fix their own rent, subject to the limitation by the Land League, not of the smallest, but of the largest amount which the landlord was to receive. Notwithstanding the appeal to their dishonest cupidity many — perhaps a majority — of the tenants were willing as well as able to pay the rent in the full; but under Mr. PARNELL's direction they could not discharge their just debts except at the risk of death, or of torture of themselves and of the women of their families, and with the certain result in all cases of social excommunication. It is by these methods that the claim to the amount which Mr. PARNELL places at 5,000,000*l.* has hitherto been asserted. It is to suppress his lawless tyranny that the Government has at last been forced to demand from Parliament additional powers. If Mr. PARNELL's estimate were as true as it is conjectural and arbitrary, it would be intolerable that a just debt of any amount, large or small, should be withheld in defiance of the law, and thus even voluntary payment should be prohibited under fearful penalties.

The opponents of the Government, for it must be assumed that it has no treacherous friends or members of its own body, probably refuse their consent to the enforcement of the laws which ought to protect life and property in the hope that a continuance or increase of disorder may still further terrify the landlords, and may affect impending legislation to their disadvantage. They wish, not only to deprive Irish landowners of a considerable portion of their rights, but to establish a precedent which may hereafter be applied to England. A few greedy tenant-farmers have already imported the clamour for fixity of tenure or for the transfer of the land from the owner to the occupier under a temporary contract. It must be allowed that some of the provisions of the promised Land Bill will be equally applicable to Great Britain. There is no doubt that Parliament will deal with the holders of limited interests in land as if they possessed the fee simple for purposes of alienation. Life tenants will be enabled to sell the freehold, while the rights of remainder-men will be confined to their share of the purchase-money. Some measure of the kind is necessary in Ireland, and whether or not it is expedient, it is inevitable in England. On the other hand, it would be intolerable that English rents, fixed by contract, should be liable to judicial revision. In Ireland so

prudent and well-informed a writer as Lord DUFFERIN approves of the establishment of an equitable jurisdiction over rents. Mr. GLADSTONE'S cautious phrases implied that there would be some provision of the kind; but he said nothing about fixity of tenure, or the creation of a saleable tenant-right without consideration given by the actual occupier. In his answer to the deputation headed by Mr. SHAW, Mr. GLADSTONE was unusually and laudably reticent. Lord HARTINGTON, in his powerful speech on the amendment to the Address, boldly declared that it was essential, not that the Land Bill should be weak or strong, but that it should be just. The organ of revolution, if not of communism, accepts Lord HARTINGTON'S proposition with the comment that justice coincides with the greatest happiness of the greatest number. The meaning is, that as the tenants largely outnumber the landlords, justice requires the spoliation of the few for the benefit of the many. It is not to be regretted that the doctrine of the extreme Radicals should be stated in its most offensive form.

It is the plain duty of the Ministers, although they have simultaneously announced the introduction of the Coercion Bills and the Land Bill, to keep them scrupulously apart. It is now useless to inquire whether concession should have seemed to be the price of the protection which is to be tardily extended to the peaceable part of the population. The Government has determined on its course, and it ought if possible to be supported. It would forfeit all claim to toleration if it were to enter into bargains with the opponents of coercion. Mr. GLADSTONE and Mr. FORSTER will not be suspected of having retracted their former erroneous decision without ample reason. They are pledged, not only to the duty of passing a Peace Preservation Bill, but to the belief that it is indispensably necessary. Adversaries who publicly or privately intimate their readiness to acquiesce in coercion, if only the landlords are compelled to make some additional sacrifice, are entitled to no respect. It is perhaps lucky that the Conservative Opposition, while it will vote for all necessary measures of restriction, is not unlikely to persist in criticizing, though scarcely with useful results, the past conduct of the Government. The extreme Radical faction will be on the watch for opportunities of taunting Mr. GLADSTONE with an unwelcome, though unavoidable, alliance. He is bound to use his majority to suppress obstruction and resistance to necessary measures, though its composition may be heterogeneous. Parties will perhaps rearrange themselves when the Land Bill becomes the subject of discussion, though on this subject also the Conservatives ought to assist the Government, as far as its proposals are just and essential for the permanent pacification of Ireland. It would be an inexcusable blunder to defeat the Government by any kind of coalition with the revolutionary party, which will assuredly be dissatisfied. The Act of 1870 was, as a precedent, more distasteful to owners of property than any moderate measure which may purport to supply its defect; yet Mr. DISRAELI induced his party not to vote against the second reading.

THE TRANSVAAL.

THE confused and fragmentary reports of events in the Transvaal throw little light on the prospects of the unfortunate contest. The immediate cause, or rather the occasion, of the revolt was the attempt of Commandant RAAF to arrest certain Boers who had refused to pay taxes. As he had only a small force of police at his disposal, he was compelled to retire without effecting his object; and the armed body which had successfully defied the law may perhaps have been the nucleus of the army now in the field. The circumstances of the attack on the detachment of troops which was marching on Pretoria are not yet fully known. There is little doubt that they were surprised; and perhaps the officer in command may not even have been aware that the Boers were already in open rebellion. It is difficult to understand their motive for perpetrating one or more brutal and unprovoked murders. Two officers, who had been released on parole, were escorted to the banks of a river, which they were compelled to pass at a dangerous ford; and while they were in mid-stream the escort fired at them and killed one, his companion only escaping by diving. A party of sportsmen, who probably supposed themselves to be in a peaceful country, were chased by

armed insurgents, and some of them were killed. The persons in command of the main force now besieging Potchefstroom had not, to the date of the last accounts, executed their threat of putting Commandant RAAF to death. One of their sympathizers in this country had the impudence to apologize by anticipation in a letter to the *Times* for the expected murder, on the ground that RAAF is himself a Boer, and that he had loyally and gallantly served in the English army under the then *de facto* Government of the country. The writer of the letter to the *Times* is evidently not a Dutchman or Afrikaner, but an English and cosmopolitan philanthropist. The ill-advised protest against English retention of the Transvaal, which has received a certain number of signatures in Holland, will luckily cause no diplomatic embarrassment. It appears that the promoters of the movement are democrats of the modern type, who only recognize Governments constituted on their favourite model. The Dutch memorialists indignantly repudiate the statement that they are about to address the English Government. On the contrary, they appeal to the nation. As the nation cannot conveniently enter into correspondence, the document will remain without an answer.

A body of insurgents crossed the frontier into Natal, and afterwards retired, as it is oddly stated, on the remonstrance of the Natal authorities. The rebel Government is also said to have warned the Government of Natal that in allowing its territory to be used by English troops it was committing a violation of neutrality. There is not the smallest reason why in time of war the Boers should not invade an enemy's territory. The question whether they are entitled to be treated as belligerents must be decided hereafter on fuller knowledge of the circumstances. In any case, they have quite as much right to attack English troops in Natal as in the Transvaal itself. The assumption that a Government of a Crown colony holding the QUEEN'S commission could be neutral in a civil or foreign war against England is so ludicrous as to be almost unintelligible. The Natal colonists, though they have not, like the Cape, acquired internal independence, in the form of responsible government, may reasonably contend that they are in no way responsible for annexation or for any other measure which may have tended to cause the rebellion; but the same allegation might be made on behalf of the population of an English county. Natal, like all other parts of the Empire, is a party to every war waged in the name of the QUEEN. Whether the Boer insurrection amounts to war is another question. In war, foreign or civil, an English general would certainly not ask the permission of the Natal Legislature to use the territory of the colony for any military operations which might be required. It may or may not be the duty of the inhabitants to contribute to the expense of the war, as far at least as may be found necessary for the protection of their own territory. On the other hand, it is not disputed that the affairs of the Transvaal are properly, and perhaps exclusively, of Imperial concern. It is more likely that misunderstandings may occur with the Cape than with Natal. A population of twenty thousand whites living in the same district with twenty times their number of natives, many of them Zulus, is not likely to renounce the protection of England. It seems probable that a late outbreak of the Pondos in the neighbourhood of the Natal frontier may have been suggested by the Transvaal insurrection.

The Basuto war, notwithstanding the exaggerated apprehensions which it has caused, seems to be approaching its end. Although the native chiefs have not submitted, they seem unable to obtain any advantage, and the colonial troops constantly capture large herds of cattle. In South Africa live stock rather than guns and standards supplies the recognized trophies of war. The combatant who captures the greatest number of oxen may consider himself the victor. The establishment of colonial authority in Basutoland may not, perhaps, be altogether advantageous to the English cause in the Transvaal. Every measure which tends to weaken the natives in any part of South Africa diminishes the motives of the Boers in the outlying provinces for courting English protection. It is also probable that, on the restoration of peace in Basutoland, disaffected colonists of Dutch origin will be at leisure to agitate in favour of their insurgent countrymen. There is no doubt that the colonists will effect at their own discretion the settlement which will follow the war. Lord KIMBERLEY, though he formally reserved to

the Imperial Government a technical control, some time since informed the Aborigines' Protection Society that the Colonial Government will practically use for its own purposes the victory which they will have achieved without assistance. The passage in the Speech from the Throne in which the QUEEN intimated her readiness to mediate between the Basutos and the colonists was not well advised. The English Government is as much at war with the Basutos as Natal is at war, if it be a regular war, with the insurgents in the Transvaal. Lord KIMBERLEY has, as might be expected, declined an officious suggestion that the CHIEF JUSTICE of the Cape should be despatched as a Commissioner to the Transvaal to ascertain the wishes and feelings of the Boers. Their intentions have never been concealed, though their methods are still imperfectly known. When the Irish debates in the House of Commons come to an end, there will probably be a discussion on the affairs of the Transvaal. In this instance the accidental postponement of discussion is not to be regretted.

The moral and political complications with which the Government has to deal could not be better explained than in Lord KIMBERLEY's reply to a deputation which he received on Wednesday last. The Peace Society, represented as usual by Mr. RICHARD, has a certain claim to respect, inasmuch as it employs itself in the prevention of one of the greatest of human evils; but it is subject to the disadvantage of exhausting its authority at once by enunciating on every occasion, without regard to circumstances, its solitary principle. If war is never justifiable, it obviously follows that no particular war ought to be prosecuted; and those who hold the doctrine can expect little attention to their arguments when they contend that an actual war is unnecessary or unjust. It was perhaps from a consciousness of the inherent weakness of their position that Mr. RICHARD and his friends associated with themselves some persons who, as he said, only object specifically to the war with the Boers. Lord KIMBERLEY readily admitted that the question is embarrassing, and that the experiment of annexation has not succeeded. If the result had been foreseen, the English Government would not have engaged in an enterprise which, nevertheless, was undertaken in perfect good faith and with benevolent objects. The Boers would certainly have invoked protection if it had not been thrust upon them prematurely. They offered only a verbal resistance to the assumption of the government by Sir THEOPHILUS SHEPSTONE, who had no armed force at his disposal. Since that time they have been offered the amplest constitutional liberty, if only they would consent to acknowledge the supremacy of the Crown. Only three or four weeks before the insurrection Sir OWEN LANYON expressed a confident opinion that the disaffection in the province would gradually subside. Lord KIMBERLEY perhaps went too far in hinting at the possibility of compromise, though he would be well advised in taking advantage of any opportunity of an amicable settlement. It is not well to make even indirect overtures to rebels in arms. As Lord KIMBERLEY said, it is a plain duty in the first instance to rescue, if possible, the garrisons and the English men, women, and children from besiegers who have but a doubtful regard for the laws of war or the dictates of humanity. It is further necessary to consider the English population which has acquired a vested interest in the protection of the Imperial Government and in the maintenance of its laws and institutions. Lord KIMBERLEY also referred to the native tribes scattered over the vast expanse of the Transvaal, who would probably be unanimous in preferring the supremacy of the Crown to the dominion of the Boers. One of the deputation deviated from the question into a protest against the Basuto war, which results from the application to the Cape of the purest doctrines of modern democracy. There is not a philanthropist in Birmingham who would not oppose and resent any attempt on the part of the Imperial Government to restrict the powers conceded to the colony. When the Government of the Cape exercises its discretion in a manner not agreeable to the Peace Society they must settle the account with their friends. The Transvaal difficulty, on the other hand, concerns the English Government alone.

OBSTRUCTION AND ITS PRETEXTS.

THE debate on the Address has now lasted for more than a week, and the date of its termination cannot yet be determined with certainty. Mr. PARNELL would not, at the close of Thursday's sitting, enter into any arrangement that a division should be taken after one more night's debate; for such an arrangement would be, in his opinion, to admit the principle of the *clôture*; but he owned that by that time everything that could be said to any kind of purpose would have been said. This, at least, is beyond question. Everything that could be properly said about Ireland in a debate on the Address, and very much more, has been said, and said over and over again. Nor has time been thrown away only by the useless prolongation of the debate. The greater part of Wednesday was altogether wasted. Mr. GLADSTONE gave distinct notice that the debate would be continued from day to day without interruption, and the proper steps were taken by the Government to have Wednesday as clear as any other day. Two members whose private Bills were coming on then consented to postpone them; but a small knot of Irishmen insisted that they were taken by surprise. They did not understand how the House manages its business, and insisted that there was a surprise, and that the Government was desirous to steal a march on them, and to stifle debate. They had expected that the Bills of the private members would be first taken, and they considered it most unhandsome on the part of the Government that they themselves should have made a mistake. It was in vain that members of experience and moderation explained that there could have been no surprise if those who felt surprise had understood the procedure of the House. The surprised Irish insisted that they were surprised, and that, as this could not be their fault, it must be the fault of some one else. Mr. PARNELL interposed with the extraordinary proposal that he would terminate the surprise of his friends and let the debate go on if, in return, the Government would subsequently cut two hours out of the debate and give them to him, that he might move for a Select Committee to inquire into the very facts which the Government says it has collected on unimpeachable authority. As the Government would not even notice this modest proposal, four hours were consumed in a discussion as to the legitimacy of the surprise felt by a small minority, which surprise arose from ignorance of the forms of the House. This might naturally be called obstruction; but Mr. PARNELL prudently disclaimed any wish to have recourse to obstruction. He knows the indignation which anything like wanton and obvious obstruction would now cause, and he also knows that he has a machinery at his command which can ensure the attainment of all that at which obstruction aims, without seeming to go beyond the bounds of propriety. It cannot be denied that the Irish members represent the electors who have returned them, and on Irish questions every Irish member can plausibly say that he wishes and is bound to make known the views of his constituents. Mr. PARNELL can command the tongues of at least forty members. On every point of every Irish Bill he can, therefore, get forty speeches made by Irish members. If the Government lets the speakers follow one another without interruption, it will be loudly accused of treating the Irish members with contempt, and not fairly meeting them in argument. No obstacle in the way of Parliamentary legislation was ever more serious. If the Irish members defied the House, the Government might find some sharp remedy; but what is to be done if forty members argue about every section or word of a Bill, when that Bill is one on which they have a special claim to be heard? Mr. FORSTER will propose his Coercion Bills as early as he can; but the House, of which an overwhelming majority is ready to accept them, will have to listen to hundreds of Irish speeches before it sends them to the Lords. The Government will be very fortunate if it gets through these Coercion Bills in the extra month by which it has anticipated the usual time of beginning the Session.

With very few exceptions, the debate after the first night or two was devoid of any real interest or instruction. But there were exceptions. The first is that it is now possible to see from the debate how far the followers of Mr. PARNELL have been enlightened as to the points to which they must mainly adhere. The argument that the Government ought to have begun with their Land Bill before they proposed coercion has been annihilated. If the state of things in Ireland is bad enough to warrant coercion, it cannot be

suffered to continue until something also has been discussed and settled. If the Land Bill is to be accepted by England, it must not seem to be a mere concession to agitators who have been guilty of every kind of outrage. The statement that the outrages which have been committed in Ireland are either the fictions or exaggerations of newspapers has been disposed of as irrelevant. Mr. FORSTER declares that he does not rely on newspapers at all. He goes exclusively by the reports of magistrates, policemen, and others who have had actual and personal knowledge of the truth of what they say, who have special means of acquiring information, and are under a positive obligation to communicate what they know. The line that is thus left open to the Irish minority is therefore that of attacking the magistrates and the police. They have taken this line already, and may be expected to pursue it with increased vehemence when the Coercion Bills come to be discussed. They say that the magistrates are not, and cannot be, impartial; that they belong to a class opposed to the people, and are necessarily warped in their judgment by their habitual feelings. They further say that a considerable portion of the outrages has been actually committed by the police, who have thus invented crimes for the purpose of denouncing them. Where the police have not invented crimes they have grossly exaggerated them, in order to please their superiors and gain credit for activity. For the purposes of debate it is immaterial that these accusations are entirely unfounded. They may easily supply a very powerful instrument for stopping the progress of the Bills. Mr. FORSTER rests his case entirely on the evidence which he can produce; and he obviously believes that, if he produces evidence sufficient in quantity and in strength, he will have made good his case. But his evidence will be attacked, not on the ground of quantity, but on that of quality. There is great danger that the debate on the Coercion Bills will be turned into an irregular trial of the Irish magistracy and police. If Mr. FORSTER says that a magistrate states something, he will be asked who this magistrate is, whether he is not somebody's agent, and, if so, what is the system pursued in the management of his principal's estates? If Mr. FORSTER says that a policeman saw a rick of hay on fire, he will be asked how he knows that the policeman did not himself apply the match. If he says that policemen visited the scene of an outrage immediately after it had been committed, he will be asked why the policemen should be believed rather than the supposed victims of the outrage, who have never complained. The most prudent line the Government could take would probably be to decline altogether to enter into discussions of this kind; but, in practice, it is very difficult for the Minister in charge of a Bill to refuse to make further inquiries when the accuracy of a fact on which the Government relies is strongly contested by any considerable number of members.

The other exception to the sterility of the debate in its later stages was the speech of Lord HARTINGTON. It was a strong speech, and its strength was frankly acknowledged not only by Conservatives, like the member for Preston, who said that he was proud to think it had been made by a Lancashire member, but by the Irish themselves. Lord HARTINGTON's speech had the very great merit of going to the root of the matters on which he touched. Crime might be palliated by great distress; but, far from recent Irish crimes having been committed in a time of exceptional distress, they have been committed in a time of exceptional abundance. Crime might be to some degree excused on the part of tenants and labourers suffering under the harshness of landlords; but recent crimes have been committed at a time when there has been a complete absence of harsh acts on the part of landlords. The Government is going to bring in a Land Bill, and has been told that its Bill is likely to be a weak one, while nothing will do but a big Bill and a strong Bill. Lord HARTINGTON replied, in language that deserves the attention of his supporters and of the country, that what is really important is not that the Bill should be big or strong, but that it should be just and effectual. It is said that to talk of the necessity of coercion is to indict the Irish people. On the contrary, those are indicting the Irish people who say that the people is a partner in the guilt of a few wicked agitators—miscreants, as Lord HARTINGTON called them, to the surprise of some who fondly hoped that their friends might be treated as a set of innocent, though misguided,

people. The more respectable members of the Land League discountenance in a mild way outrages which they say discredit or injure the cause. Lord HARTINGTON said that they were rather unjust in this criticism. Far from injuring the cause of the Land League, these miscreants have been the main instruments of its success. It is they who have supplied the force which alone has made the new law of the Land League a reality. Mr. PARNELL, who is mildness itself in the House of Commons, has out of it gone so far as to recommend the Irish, if they cannot get justice otherwise, to seek it by open force. Such incitements to rebellion are wholly unjustifiable, even in the best cause, unless the person who gives the advice honestly believes not only that he has a cause absolutely just, but that a struggle can be attempted with a fair prospect of success; and Lord HARTINGTON asked Mr. PARNELL to examine seriously whether he believed that in an open rebellion the Irish would have even the dimmest shade of a chance of success. Let us, said Lord HARTINGTON, in conclusion, be careful above all things not to throw away the substance and clutch at the shadow. Let us not throw away the substance of the freedom of debate to clutch at the shadow which screens obstruction, or throw away the substance of constitutional liberty to clutch at the shadow which allows the protraction of a reign of terror. It is satisfactory to find that a leading member of the Government does not shrink from looking the Land League in the face, can tell it some plain truths, and makes it known that, although Englishmen are willing to do all they can for the Irish, they are not in the least afraid of them.

THE ATTITUDE OF GREECE.

WHILE it would be rash to venture on a confident prognostication as to events in the East, the balance of probability inclines to the side of peace. As in many other instances, direct testimony conflicts with circumstantial evidence, or with calculations founded rather on the position and interest of the parties concerned than on their avowed intentions. English correspondents at Athens, thoroughly acquainted with Greece, and sometimes fresh from interviews with the PRIME MINISTER, are convinced against their will that an irrevocable resolution has been formed to appeal to arms. The KING and his Ministers are pledged to the Assembly, which again finds it impossible to resist the decree of a unanimous nation. Terrible consequences which have never been clearly defined are anticipated as the result of opposition to the popular will. The arguments used by Mr. COUMOUNDOURIS are not so conclusive as his declarations are positive. He cannot, as he alleges, take less than the territory which is supposed to have been awarded to Greece by the Conference of Berlin. If he is reminded that there could be no award when there had been no submission to arbitration, he would probably reply that the Great Powers of Europe would not have published a decision except with the purpose of making it conclusive. There is no doubt that the Conference was a mistake; and some of those who took part in the deliberation probably attended the meeting under a misapprehension; but United Europe must have the right, as it has certainly the power, to explain, and even to explain away, a policy which it is not disposed to pursue. The especial patron of Greece has of late taken the most active part in dispelling illusions which were perhaps sincerely entertained. The Conference appears to have been organized by England; but of late the French Government has taken the lead in the Greek question. M. DE MOUR and M. BARTHÉLEMY ST. HILAIRE have taken care that the Greek Government shall fully understand their present opinions and intentions. France strongly urges submission to the arrangement which is called arbitration, though it really means diplomatic compromise. Germany has cordially supported the proposals of France, and Austria, as usual, concurs with Germany. The English Minister has strongly seconded the representations of M. de Mour; and, finally, Russia adheres to the general concert. It might have been supposed that the authority of the Great Powers would render argument superfluous; but hitherto the Greek Government has not ostensibly yielded to pressure; yet the delay which has been secured diminishes the risk of a fatal decision. Mr. COUMOUNDOURIS has so

far taken part in the discussion as to inquire whether any guarantee will be given for the enforcement of concessions which might fall short of the settlement of Berlin.

The news from Constantinople is less uniformly warlike; and it is something that the proposed arbitration has not been formally rejected; but the armaments by sea and land are proceeding with vigour; and the reactionary general, OSMAN PASHA, has been appointed Minister of War. Those who make it their business to ascertain and record political facts and tendencies in Turkey have long since settled down into chronic scepticism. It is ~~not~~ assumed that the Government will act on its own declarations, or that the system which is in favour to-day will prevail to-morrow. It is only certain that whether or not the SULTAN meditates war he has not cut off his retreat. Notes in which arbitration is peremptorily refused have been sometimes announced, and perhaps drawn up, but they have not yet been issued. One reason for dilatory negotiation is probably the hope that the Greek Government may put itself in the wrong by assuming the offensive. The litigant whose adversary declines a reasonable settlement enjoys an undoubted advantage. The Turks have, up to the present time, contrived to postpone any cession of territory to Greece, and yet not directly to contravene the recommendation appended to the Treaty of Berlin. They have always professed their readiness to make a sacrifice which they considered to have been unjustly forced upon them; but their negotiations with Greece never arrived at a practical result. They will certainly take the risk of war in preference to acquiescence in the line laid down by the Conference; nor will they be parties to an open arbitration which might confirm the decision of Berlin. They have good reason to believe in their ability to repel and to punish any invasion from the side of Greece; but they cannot disguise from themselves the danger of insurrection and of frontier war in more than one quarter. The assertion which has been hackneyed for fifty years, that the Empire is on the verge of dissolution, has of late been repeated with additional confidence and with great plausibility. The Government has been seriously, if not fatally, weakened; and, though it still disposes of a considerable military force, it is in extreme financial distress. If Greece stood alone, it would be in the interest of Turkey to hurry on the conflict; but the ulterior results of war are not to be easily calculated.

It has not escaped the notice of astute politicians at Constantinople that the proposal of arbitration implies a disposition to recede from the terms imposed by the Berlin Conference. For this reason Greece has from the first been more unwilling than Turkey to entertain the suggestion. Some of the Powers are inclined to send a commission to the frontier to examine the local conditions which might affect the claims of the parties. It is not for the moment convenient to remember that the decision of the Conference of Berlin was founded on reports from high military and geographical authorities. It is understood on all sides that an arbitration would only be a mode of recording a decision previously formed by agreement. At this moment Greece might probably acquire without dispute all the rest of the territory on condition of abandoning the claim to Janina and Metzovo. It is more than doubtful whether as much could be obtained by war; and it is not impossible that in case of defeat the Greeks would obtain nothing. As long as negotiations continue, it is always possible that obstinacy may be merely employed as a diplomatic weapon. The Greek Ministers will have to exercise moral courage in abandoning the smallest fraction of the national demand; but it is reasonable to assume that they would be prepared to encounter a certain risk for the purpose of serving the country against its will. A financial operation which is said to be under the consideration of the Turkish Government would provide, if the rumour is well founded, an additional reason for settling the frontier question without unnecessary delay. It is said that German capitalists are in treaty for the purchase of the Vakouf or ecclesiastical estates throughout European Turkey. It is not improbable that the Government of Constantinople might be favourably disposed to an arrangement which would give a German Company an interest in property within the Empire. To the Greek Government a powerful body of foreign proprietors would be extremely obnoxious. The whole story is doubtful, but there are many symptoms of a desire on

the part of the Turkish Government to court the favour of Germany.

The irritation which prevails at Athens is perhaps an indication that the Government is beginning to waver. One objection which has been urged against compromise is that it will tend to cause war hereafter. The nation, dissatisfied with an incomplete recognition of its supposed rights, will, it is said, seek future opportunities of enforcing the same or more extensive demands. As an English statesman once said, if the choice must be made, a possible future war is better than a certain and immediate war. It is, on the whole, probable that, whether Janina is assigned to Greece or to Turkey, further attempts will be made to unite all the countries where Greek is the prevalent language to the present kingdom. If the Turkish Empire breaks up, a Greek Government, with Epirus included in its dominions, would be in a convenient position for acquiring Janina. It is probable that Greek ambition will point in another direction. Crete, and the islands of the Archipelago which now belong to Turkey, have always been regarded by patriotic Greeks as their own legitimate property. The modern doctrine of ethnology destroys all scruples which may have been formerly entertained as to the morality of conquest. It may be admitted that the intellectual, if not the moral, qualities of the Greeks render such pretensions in their case comparatively tolerable. With such prospects before them, the Greeks may afford to bear a temporary disappointment. They will have gained more by the Russian invasion of Turkey and its consequences than they could reasonably have expected a few years ago. At this moment they have the satisfaction of being courted by all the Great Powers to desist from warlike preparations which threaten to be ruinous. The situation would be wholly changed by a defeat, which military judges think more than probable in the event of a war. Though the Government can dispose of an army numbering perhaps 60,000 men, it has no adequate commissariat or means of transport; and it has not the command of the sea. The warnings, emphatically repeated again and again by the French Ambassador, may perhaps not be literally fulfilled. The Greeks will, in the contingency of the march of the enemy on Athens, probably receive direct or indirect assistance; but the Great Powers will not think it necessary again to urge upon Turkey the surrender of Epirus or even of Thessaly. The kingdom will be for a long time discredited by the demonstration of its weakness. It is true that speculations of the kind are conjectural and uncertain; but prudent statesmen would not incur so imminent a risk of a great catastrophe; on the whole it is probable, but not certain, that both Greece and Turkey will submit to a compromise under colour of arbitration.

ECCLIESIASTICAL TOLERATION.

THE *Times* would have assumed a more statesmanlike position if it had condescended to handle the plea for toleration presented to the Archbishop of CANTERBURY by the Dean of ST. PAUL's and other representative men of the moderate High Church party with a somewhat more accurate perception of the question upon which it claims to arbitrate. Rhetorical assertions which would have passed current a few years since must now submit to the test of facts; for society is full of students who appreciate that the grievance under which a large section of the most active Churchmen believe themselves to be suffering is twofold. Their most weighty contention is that the existing Courts of Church judicature have within the last fifty years been created or remodelled by the civil power with so conspicuous a contempt for the opinion of the Church as a spiritual body as to be sadly lacking in those moral claims with which no tribunal can safely dispense. But they are also in the belief that these Courts, so unfortunately constituted, have given interpretations of the ritual law of the Church very hard indeed to reconcile with history, or indeed with simple grammar. It is legitimate in the writer who discusses the question to begin with either of these branches of the grievance. It is not, however, fair dealing with the difficulty to single out one head and pass the other over. It is even more blameworthy to present a controversy which lies within the limits of the actual Church of England—the Church of the Acts of Submission and of Uniformity—as an attempt to alter the character of that Church by the infusion of

alien elements. The DEAN and his friends choose to begin with ritual, and go on to the Courts. They might with equal force have reversed the order of topics. But the *Times* meets their comprehensive plea by labouring away at ritual and totally overlooking the wider allegation. We can only meet such a controversialist upon his own limited area; but we may observe how far his grasp of his chosen topic leads to the presumption that he is capable by knowledge and reflection of adequately handling the entire question.

To the eyes of the *Times* the whole trouble is about more or less ceremonial, and it makes the gracious concession of an infinite number of pretty things, so long as these things mean nothing at all. But let the ceremony be intended to teach some lesson, let the woollen sack be understood as implying the consideration due to the old staple of English industry, let the mace proclaim the coercive power of the law, let the blunt sword speak of mercy and the sharp one of justice, let the taps which Black Rod gives at the door imply the right of the Commons to occupy their own House and the right of the Crown to send its messenger into that House—then, if we are to believe the doctrine of ceremonial propounded by the *Times*, all these time-honoured objects and customs must hereafter be refused that indulgence which might have been accorded to them, if “only due to a growing sense of ‘decency and order.’” The misguided clergy are, at all events, “perfectly frank.” They confess that the points of ceremonial over which the main controversy ranges are those which signify “a definite Eucharistic doctrine,” while “it is idle to ask for toleration of the ritual which ‘represents it unless a like toleration is asked for the doctrine itself’ that doctrine being ‘deeply repugnant ‘to the vast majority of English Churchmen.’”

All this is simply throwing stones when sound discretion, not to talk of respect for the other side, would have counselled the less flashy, but wiser, course of striving to convince by argument. Unproven and gratuitous accusations of fostering Popery thrown out against such men as DEANS CHURCH and LAKE, LORD ALWYNE COMPTON, and DR. LIDDON are tall talk, but it is rash talk when it is used to bias a controversy which, if reduced within the limits of pure reason and substantial fact, is of very narrow dimensions. The question is simply whether a direction now to be found in the Prayer-book, and which, among other things, seems to prescribe a vesture for the celebrant of the Holy Communion differing from that which he is ordered to wear at other services, is to be taken as really doing so, or whether a document—more ancient than the direction in its present shape, but nowhere referred to in that Prayer-book which might have embodied it—is to be read into the Rubric, so as in that particular to modify the direction which is otherwise recognized as holding good. Polemists to whom merely legal distinctions are abhorrent can only complicate the discussion by inquiring in addition, whether it is morally and historically conceivable that a Church which holds the sacraments to have been ordained by CHRIST himself and generally necessary to salvation can or cannot desire to invest the ministration of one of those sacraments with a pomp superior to that which accompanies the performance of other acts of worship which, however meritorious they may be, are not sacraments.

The legal controversy involves history, and the polemic one brings in dogma. Either contention may be established independently of the other, while it would be a result much to be deplored if the debates were to land us in the conclusion that a vesture could be established as lawful within the Church of England as significative of doctrines which ought not, by plain inference to be drawn from its formularies, to have a place in it; or else that the doctrinal defence was complete for ornaments the employment of which was barred by the law. The former state of things would be anomalous and the latter tyrannical. Either the *Times* does not know, or else, knowing it, declines to remind the world, that the latter alternative is absolutely the present condition of the Church of England under successive rulings of the Judicial Committee. Within the last ten years there have been three judgments of the Judicial Committee having reference to the ceremonial or to the doctrine of the Eucharist. The PURCHAS and the RIDSDALE judgments cut down the ceremonial in the direction most pleasing to Low Churchmen. The BENNETT judgment gave license to doctrine in the direction most pleasing to High Churchmen, and so the result is, borrowing the expressions of the

Times, to establish a “representation of Eucharistic doctrine” at the Holy Table more contracted than the representation of the same doctrine which it is permitted by the same authority to put forward from the pulpit. So although, in the opinion of the *Times*, it is “idle to ask” for toleration of the school which represents “a definite Eucharist doctrine,” “unless a like toleration is asked for the doctrine itself,” it is reasonable, and it is in fact the law, by successive rulings of the Judicial Committee, to recognize that toleration for the doctrine itself which is refused to the ritual which represents the doctrine. Arguments which ignore or are ignorant of the actual condition of matters are obviously inconsistent with facts, and are of the slightest possible value when taken in comparison with the well-instructed and carefully reasoned plea of the memorialists. Their request is only for the toleration and not for the enforcement of what they believe to be abstractedly lawful, and we much mistake them if they are anxious to obtain that toleration unless guarded by every restriction needful to secure the peace of mind of Churchmen who hold opinions differing from their own.

Judging by the wise and tolerant speech which the Archbishop of CANTERBURY made to the clergy of Thanet—which indeed gave the hint for this Memorial, and which has been followed up by a letter of his in the same tone to Canon WILKINSON—we anticipate at all events a serious endeavour on the part of the Episcopate to ease the existing strain. At the same time the ARCHBISHOP on one side and the memorialists on the other must be well alive to the risks of throwing the Church question upon the floor of the House of Commons. But much may be done without direct recourse to Parliament, and not the least profitable result would be to create the impression among sections of Churchmen in whom the hope has been damped that in the rulers of the Church they possess guides who appreciate and who sympathize with their difficulties. Men will bear much if they believe that those in authority would help them, if they could, in their troubles, while they would be made desperate by the suspicion that they were being deprived of the sympathy of their natural protectors. When the time comes for practical arrangements we are sure that the “common sense,” and “healthy distrust of needless ‘innovation,’” to which the *Times* appeals, will not be wanting either among clergy or laity. Still, we must point out that it is not so many years since the “mere ceremonial change in the conduct of worship” which is now recommended to us in that paper was very stoutly resisted, in the name of common sense and healthy distrust of needless innovation, by self-confident organs of public opinion.

LORD LYTON ON AFGHANISTAN.

LORD LYTON'S speech took many of his hearers and readers by surprise. It was supposed that he was going to make a personal explanation to defend himself where he had been unjustly attacked or to give some information which he alone could command. There was nothing of the sort in his speech. He confined himself exclusively to a statement of his reasons why, in his opinion, the intention of the Government, announced in the QUEEN'S Speech, not to retain Candahar permanently was an unwise one. The occasion taken by LORD LYTON for opening this important and interesting question was in some ways unlucky. The papers on Afghanistan, which the Government is going to publish, have not yet been laid before Parliament, nor have the exact intentions of the Government been revealed. It may be meant by what has been announced that the English troops will be brought back in the spring, leaving chaos behind them; or it may be meant that the troops will be kept at Candahar until a native ruler, acceptable to the people and strong enough to hold his own, is found to take over Candahar, in which case the occupation, if not permanent, may be protracted for an indefinite time. When the intentions of the Government are known, they will have to be freely canvassed and closely criticized. Lord LYTON to some extent apologized for the criticism he was instituting. It was, he truly said, most desirable that Indian questions should, so far as possible, not be made party questions, and he was alive to the evil of an ex-Viceroy coming back from India and immediately raising in Parliament matters of controversy between him and his successor. But it is

quite impossible that all Indian questions should be treated as beyond the range of party, and an ex-Viceroy must in some cases explain why he thinks his policy right and that of his successor wrong. When there is a really important issue of general Indian policy at stake, and the leaders of one party have a strong opinion one way, and the leaders of the other party have an equally strong opinion the other way, there is no mode of getting adequate discussion except by a strenuous party debate. When, again, a decision has to be come to quickly, and an ex-Viceroy must contribute his share to the discussion while there is time, he cannot avoid putting himself forward as the opponent of his successor if he disagrees with him. When the proper time comes, when the promised papers have been published, and when the exact meaning of the language used in the QUEEN'S Speech has been ascertained, a question will have been raised of very great importance to England and India, on which light can only be thrown by the expression of the varying opinions of party leaders, and on which the opinion of the person who has just quitted the Government of India will be valuable and welcome.

Even, however, after reading Lord LYTON'S speech, it is not very easy to discover when it became a part of the policy of the late Government to retain Candahar permanently. It may be observed that Lord BEACONSFIELD, in criticizing the QUEEN'S Speech, carefully guarded himself against saying that Candahar ought to be retained permanently. What he deprecated was, in his epigrammatic language, "scuttling out of Afghanistan." It was not a withdrawal, but a hasty and pusillanimous withdrawal, to which he objected. What, however, seems really to have happened was this. Candahar and Cabul were both held by our troops at the beginning of last year, and at that time there was no intention of annexing either, or of annexing any part of Afghanistan. Lord LYTON, if he was correctly reported, said this distinctly at the time. But it was determined to treat Cabul and Candahar differently. Cabul, after proper punishment had been inflicted on the murderers of CAVAGHARI, was to be handed over to the most promising candidate for the post of Ameer that could be found, while Candahar was to be made independent of the ruler of Cabul, and placed under a nominee of England protected by the presence of the English troops, not holding the town, but stationed in cantonments in the neighbourhood. This arrangement was carried out. A Wali was duly appointed, with British troops to guard him. A rival chief marched against him and us, the WALI'S troops deserted, and after much trouble we defeated the invader. The WALI was utterly sick of his disagreeable duties and went off, leaving our troops in Candahar without any government being established there. What Lord LYTON says is, that we may repeat the experiment if we please, and get another Wali to try his chance, or we may set up the Government of the QUEEN; but the essential thing is that our troops should not go away. It is, he urges, an advantage to England, and a very great advantage, that we should have troops posted at Candahar, and that we now can stay there, and this is the main advantage we have got out of the war. If a British envoy could have been maintained in security at Cabul, that would have been a sufficient advantage. But a painful experience has shown us that this cannot be done. As we cannot have this advantage, then let us keep the other advantage we have gained.

The real question to be decided is whether the alleged advantage of retaining Candahar is an advantage or not. It is no use saying that we must have something to show for all the blood and treasure we have spent; for, unless this something is in itself worth having, there is really nothing to show. Still less can be said for the notion of quitting Candahar to show our penitence for the whole Afghan war. The question is more serious whether we are bound by explicit pledges and solemn declarations not to annex, under the form of a military retention or otherwise, any part of Afghanistan. No doubt, at a period subsequent to the murder of Sir LOUIS CAVAGHARI, the Indian Government stated that it did not wish for any portion of Afghan territory except for the purposes of a rectified frontier. But it may be replied that the Government afterwards tried the experiment of setting up a Wali at Candahar, and that it is only because this experiment failed that we are driven to annex.

On the question whether we are bound by a pledge not to annex depends the farther question, What would be the effect on the natives of India if we abandoned Candahar? Lord LYTON says we should lose by causing an impression of weakness and vacillation. Lord NORTHBROOK replies that we should gain by causing the impression that we are invariably honest. These questions, however, are only the fringe of the real question, which is whether the retention of Candahar is or is not a great advantage to us. The chief merit of Lord LYTON'S speech consisted in the clearness with which he explained what he meant by the retention of Candahar, and why he thought it very advantageous, as Candahar, if retained, is not to be regarded as in any way an outpost against Russia. It is not to be a second Metz offering an impregnable obstacle to the advance of a probable and dangerous enemy; for Lord LYTON totally disbelieves in the possibility of a direct Russian attack. It is to be regarded rather as one of those forts by which Wales was kept quiet when it was conquered. Either we are to control the policy of the Afghan or we are not. If we do not, Russia will control it. If we wish to control it, we have only one means of controlling it, and that is by a fort too strong for any Afghans to take and commanding the only great commercial route which the Afghans possess. This was the gist of Lord LYTON'S speech. What he will have to prove when the discussion is resumed in its proper course, and what he firmly believes he can prove to the satisfaction of all reasonable Englishmen, is that we must, if India is to be guarded against panics, control Afghan policy; that there is no other means of controlling it, or, at any rate, none nearly as effectual as the retention of Candahar; and that the retention of Candahar will permanently serve the purpose for which it is intended.

SANITARY PROTECTION.

IF Heaven helps those that help themselves, there may be a good time in store for the householders of London. They are now, for the first time, invited to form themselves into a "Sanitary Protection Association." The pleasing but delusive belief that legislation would give them the modest security they desire against sanitary mischiefs has gradually disappeared; and urban man may now be divided into those who have ceased to believe in the possibility of sanitary safety and those who, though they still believe in it, have ceased to hope that safety will be obtained. The first of these classes are accustomed to justify their scepticism by a frequent reference to milk. Do what we can, they say, we are only able to answer for our own houses. When our drains have been trapped and ventilated, and every outlet from the house has been disconnected from every inlet into the sewers; when the water which the Companies profess to supply us ready filtered has been filtered again, and even has been boiled, before a drop is allowed to pass our parched lips; when every old or unacclimatized person in our dwelling has been given a violent cold by the thorough ventilation we have introduced into every room, we are still liable to have every precaution defeated by the baleful agency of this fair-seeming poison. Even wealth which can do so much will not enable a man to keep a cow in an ordinary London house. Indeed, if, in reckless disregard of his butler's comfort, he turned the pantry into a cow-house, he would only be varying the risk. The cow is itself a sufferer by the results of civilization, and languishes and becomes diseased for want of fresh air and a country life. Nor would precautions as to the milk we provide for our own use really meet the case. Milk is precisely the thing which it is most difficult to avoid taking when it is provided for us by other people. A man who refused five o'clock tea or took care to have a lemon always about him would be a monster. Better die with natural human sympathies still welling up within us than live as the incarnation of absorption in a worthless self. Sheer inability to answer these arguments has made us sanitary agnostics. We cannot know what mischief may not lurk in the milk-can, and we do not care to know what can be proved to lurk elsewhere. All these things you warn us against may be true; but we do not see that any good comes of troubling ourselves about them. Sanitary mischiefs are universally diffused, and no precaution that can be taken will make more than an infinitesimal difference

in their number. The second class are not at all disposed to make light of the dangers to be incurred from faulty sanitary arrangements, but they are equally hopeless of getting the fault remedied. They would think no sacrifice too great provided that it brought security with it. These men would gladly forego afternoon tea to the end of their lives, or even submit to drink it in degrading alliance with boiled milk, if they could only hope that the sacrifice would be accepted. Until experience has taught them that nothing comes of it, they are never so happy as when their drains are laid open, and when the presence of the plumber excites in them a fleeting hope that he is going to put traps that will hold water, pipes that will carry off sewage, and ventilators that will carry off noxious gases into space. Unfortunately, the time has gone by when a man could persuade himself that any one of these things happened. His leaden idol has been broken; he has ceased to put faith in his plumber. He no longer cares to have his drains pulled to pieces, for he knows that nothing ever comes of it. When there is a stoppage in the drains, save when in the basement, he hears with indifference that the men have come to put it right, for he secretly suspects that there is no communication with the main sewer. In this helpless and hopeless condition he goes through life. The newest sanitary inventions cannot win a smile from him. Mr. PARNELL might obstruct the progress of a Sanitary Reform Bill without provoking him to a single harsh word.

The Sanitary Protection Association comes forward to help this latter type of men directly and the former type indirectly. To the man who believes in sanitary precautions, if he only knew how to make them effectual, it offers the means of knowing exactly where the drainago of his house is faulty, what is needed to put it right, and how much the process of putting it right will cost. We are often deterred from taking measures to satisfy ourselves upon the first of these points by the uncertainty what such an investigation will cost. The members of the Sanitary Protection Association will no longer be in any doubt upon this head. For a payment of two guineas the first year and one guinea every succeeding year, they will have the sanitary arrangements of their houses thoroughly examined, and be furnished with a diagram of the pipes, and with specific recommendations, where needful, as to the improvements. The Society will not itself undertake alterations, but its engineers will state what they ought to cost, and will report upon them when they are finished. The drains once put in order will be inspected every year, in order to see that nothing has gone wrong in the interval. Nor is it only at home that the members will enjoy this protection. For a moderate fee they will be able to have other people's houses examined. We do not observe that anything is said about the consent of the owner being first had, but we presume that this may be taken for granted. The members of the Association will thus be armed with a weapon of terrible force in dealing with people who wish to let their houses furnished for the season. If they refuse to allow the Society's engineer to examine their drains, the refusal will at once be set down to a guilty conscience. If they consent, and the engineer suggests that, in order to make the house habitable, 100*l.* must be spent in sanitary improvements, the outlay will make a considerable hole in the sum the owner expects to make by the transaction. When these arrangements have been in force some little time, even the sanitary unbeliever may come to be converted. He will see that, on an average, the members of the Association do suffer less than other people from the ills that modern refinement is heir to, and he may thus be convinced that, even if his friends' milk supply cannot be made unimpeachable, it is still prudent to make his own house as secure against disease as possible.

At the meeting in which the new Association was introduced to the notice of Londoners a statement was made which suggests that there is still something to be done in the way of sanitary legislation. It was said, we presume not without some foundation, that out of the 60,000 or 70,000 houses annually built in London, 50,000 are unfit for human habitation. If this assertion is anywhere near the truth, it reflects very great discredit on the Local Government Board and on the authorities charged with the administration of the Metropolitan Building Acts. To attempt to make the whole mass of existing houses fit for human habitation would be a very tremendous undertaking; but to ensure that no additions shall be made

to the list of houses not fit for human habitation need present no very serious difficulty. Sanitary science is perfectly able to say what is the minimum provision for health without which a house ought not to be inhabited; and, by a single clause in a building Act, it might be enacted that no new house should be either occupied by the owner, or let or sold to others for occupation, until it had been examined on behalf of the local authority and certified to possess these essential requisites. This suggestion has been again and again made in our columns and elsewhere without anything coming of it. Yet, in the absence of such a provision, the aggregate of unhealthy houses is constantly becoming greater, and all for want of a precaution that would interfere with no vested interest, and consequently cause no expense, either by way of compensation or litigation. It is a matter of astonishment that so simple a remedy for an admitted evil should so long remain unapplied.

AGENTS PROVOCATEURS.

THE HOME SECRETARY was placed in a position of no small difficulty by a question which was put to him on Tuesday in the House of Commons with reference to the case of *TITLEY*, the chemist who was convicted last month of a criminal offence in very peculiar circumstances. *TITLEY*, it may be remembered, had been induced by an elaborate and very artfully concocted plot on the part of the police to supply certain noxious drugs. The plot required the participation of an inspector of police, a sergeant, and a woman who is the wife of a police pensioner, and who "does jobs" for the police generally. Between them these persons trumped up a story of a young woman, and an agitated lover, and an obliging friend, and a mother in terror for her daughter's reputation, which parts were, with the exception of that of the young woman, played by the actors just mentioned. Considerable sums of money were also shown to *TITLEY* to tempt him to comply with the demand made, and after a good deal of hesitation he consented. The singularity of the case was twofold. In the first place, though the fact of legal criminality—that is to say, the actual supply of the drugs—was, assuming the truth of the police evidence, indisputable, it was equally indisputable that the person supposed to be in danger of injury by them was non-existent, and their criminal use consequently impossible. In the second place, there was the very questionable nature of the means by which this legal criminality had been brought about. This struck the Grand Jury so strongly, that they returned a true bill for conspiracy against the police, and though this proceeding was ineffectual, owing to a technical flaw, more or less disapproval of the conduct of the police was expressed by the judge, by the jury who tried and convicted *TITLEY*, and by public opinion outside the Court. Accordingly the other night Sir WILLIAM HARCOURT was asked whether he would direct the prosecution of the police, and this question naturally invited and produced a statement not merely as to the past, but as to the future, policy of the Home Office in relation to the practice of fishing for crime.

That the legality of the means employed to entrap *TITLEY* is not to be regularly tried is perhaps disappointing. But Sir WILLIAM HARCOURT is hardly to be blamed, inasmuch as the existence of a complete precedent in which the police not merely acted as they have acted now, but were commended for so acting by the judges, sufficiently exonerates the actors in this curious, and we fear we must say rather discreditable, affair. The HOME SECRETARY, however, promises that a somewhat strict watch shall be kept in future on the dramatic propensities of detectives. The game of temptation is not to be played without the direct authorization of the Home Office, and not as at present at the mere pleasure of the Director of Criminal Investigation. It is to be presumed, of course, that the Home Office will not vouchsafe its consent without very strong reasons, and will take great care to guard against abuse. Perhaps, as we have said, we must be satisfied with this, though it is impossible wholly to overcome the repugnance which most Englishmen feel, and rightly feel, towards such methods of detecting crime. This repugnance does not arise merely from the somewhat irrational conception of criminal investigation as a kind of sport in which due "law," in the one sense as in the other, is to be given to the accused. It arises, on the one hand, from a sentiment of natural

equity, which considers the tempter as the chief cause of the crime, and reflects that, but for the tempter, the crime would very likely never have been committed at all; and, in the second place, from a feeling of the extreme danger of such a method of detection. With respect to the first point, a good deal that is not very relevant has been said in regard to other instances in which artifice is resorted to in order to obtain evidence of guilty practices. In most such cases it is tolerably certain on the face of it that, unless the criminal is a criminal, he will hardly be tempted to commit the crime. A publican who is not in the habit of selling drink at prohibited times is not very likely to run the risk of the penalty he incurs in an isolated case. An honest man has not the machinery or the practised skill necessary for forging bank-notes or manufacturing base coin. If a purchaser goes to a shop, and demands forbidden books or prints, it is quite clear that the shopkeeper cannot sell them if he has not got them, and that he is not likely to have them, except for the purpose of illegally selling them. But every chemist, and almost every chemist's assistant, is in case to be tempted by such an artful tale as the police told to TITLEY. The drugs are at his disposal, and on his promises for lawful purposes. He is then induced, partly by the sight of money, partly by ingeniously devised and more ingeniously corroborated appeals to the feelings, to believe that he is helping some one out of a difficulty. Cupidity, good nature, ready opportunity, combine to draw him into error, and, though it is easy to say that an honest man ought in such a case to kick the tempters out of his shop, and either do his best to think no more about the matter or mention it to the police, yet opportunity, greed, and good-nature combined will always have a strong chance of drawing men in the way in which they are tempted to go.

There is, however, something more to be said in the matter than this. Not merely is it extremely likely that such methods of detecting crime may make criminals out of men who would otherwise be honest, but it is probable that it may make apparent criminals out of men who are actually innocent. In the political matters to which the use of *agents provocateurs* has for the most part been confined, the object is generally rather to obtain a clue to suspected agencies and plans, otherwise undiscoverable, than to fix guilt on any particular person. In such cases as this before us the crime is discovered (invented would be perhaps a better word) and brought home by the same persons. The tempters are the witnesses, and they are witnesses who have a strong interest in proving their case. In this particular matter of TITLEY, for instance, there was not a witness against the man who was not also engaged more or less deeply in the plot for provoking him to crime. The whole thing might therefore have been, though we have not the slightest intention of hinting that it was, as much a fabrication as the story about the young woman. Such a method of going to work is a tremendous weapon to put into the hands of the police, inasmuch as it enables a few persons to ruin a possibly innocent man without there being the least chance of his escaping. It is so very much easier, too, to discover crime in this manner than by the humdrum process of waiting till it has been actually committed, and then tracing it out, that the police might almost be tempted to employ it for their own honour and glory. The suspicions amounting almost to certainty which are supposed to justify the method are very easily formed, and corroboration is sure not to be lacking to them. Indeed some members of the police force, unless they are very much maligned, labour under a deep-seated idea that all "civilians" are not only criminals *in potentia*—which is no doubt in a manner true—but most probably actual criminals, respecting whom it is the duty of an active officer to keep his suspicions constantly aroused and to receive every information that he can possibly get hold of. The employment of *agents provocateurs* suits this temper to a nicety, and is a proportionately dangerous weapon to entrust to persons so disposed. Still it would be too much, no doubt, to assert that the process must in no conceivable circumstances be employed. Sir WILLIAM HARCOURT's promise, as we understand it, is that the Home Secretary shall comport himself towards any proposal for the employment of the police in such matters very much as he at present comports himself towards applications for the remission of the extreme penalty of the law. That is to say, he

will take the matter under his personal attention, and his decision will be a matter of personal responsibility. It is doubtful which will be the more disagreeable function; but the confidence which at present is reposed in the Home Secretary in the decision of the gravest of all questions—that of the life and death of his fellow-creatures—can hardly be refused him in a matter which, though even more repugnant to ordinary feelings, is perhaps one of less grave import. It is very improbable that the sanction of the Home Office will very often be given to these plans of espionage and masquerading, of "baiting" "the swim," like Thames barbel-fishers, and then angling for the prey like the same variety of sportsman. It may be questioned whether such sanction would ever be justifiable, except in cases where the public safety is involved on a large scale, or else in those where strong, but insufficient, proofs of repeated breaches of a particular law by a particular person are in the possession of the authorities. In the first of these cases the importance of the end justifies almost any means. In the other, the great danger of the method, the danger of inducing a previously innocent person to commit crime, or of falsely condemning one who is still innocent, is reduced to a minimum. The police are said in the present case to have had grounds for suspecting TITLEY; but no definite proof has been produced, and even in such a case it is doubtful whether it is well that a man should be condemned wholly and solely on the evidence of his tempters.

THE FRENCH MUNICIPAL ELECTIONS.

THE municipal elections in France give no indication of any change in the temper of the French people. The Conservative Opposition has a long and difficult undertaking before it. Its more sanguine members probably hoped that the recent ecclesiastical policy of the Government would have weakened the hold of the Republic upon the country, and if the country had cared about the questions with which the Government has been dealing this expectation might well have been justified. But the result makes it clear that the country is exceedingly indifferent to what has been done and to what is doing. The religious orders may be rich in virtues, but they do not seem to have specially endeared themselves to their fellow-countrymen. The closing of the Jesuit schools is an unwarrantable interference with the liberty of the parents who wish to send their sons to be taught there; but the wrongs of a few well-to-do men excite no commiseration in the minds of the majority. The peasantry do not appear to be at all disturbed at the prospect of their children growing up without religious instruction; they are probably conscious that they have never turned such religious instruction as they had in their own childhood to much account. All these things put together do not constitute a reason for returning a Conservative candidate, who has no prospect to offer them except that, if a sufficient number of men like-minded with himself can get into power, the existing Government will be overturned. On the whole, it is plain that the country likes the existing Government. Indeed, it must be admitted that, from a rudely material point of view, it has every reason to like it. The prosperity of France may not be in the least due to the policy of its rulers; but it cannot be denied that, under its present rulers, that prosperity has been very great. The collocation may be purely accidental; but as long as it continues it will have its weight with the electors. Indeed, it may be contended with some reason that it is not purely accidental. Since the retirement of Marshal MACMAHON there has been an air of stability about the Government to which France had for some years been a stranger. There has been no really serious opposition to the Republic in any quarter, and the absence of this element has given men of business an unwonted confidence in the future. Had the communal elections taken a different turn, this confidence would have been rudely shaken. The doubts that would have been excited as to the permanence of the present order of things would not have stopped short at the men who are actually administering public affairs. The Republican Government could not have been overthrown, without the Republic itself being threatened; and, so long as this remains true, it is not likely to be overthrown unless it does something very much more unwise

than it has yet done. It is easy to imagine the confusion that would reign in France if the Conservative coalition that has been contesting so many seats in the Paris Municipal Council could command a majority in the Chamber of Deputies. The moment of the coalition's success would also be the moment of its disruption. Those who compose it would find that the agreement between them had been simply destructive. They had all wanted to upset the Government, but no two sections of them would be of the same mind as to what was to be done after the Government had been upset. The uncertainty which was so conspicuous in the months that followed the 16th of May would return in increased force, and while that uncertainty lasts France would be paralysed abroad and uneasy at home. This is not a prospect that has any charms for men of business, and in France, more than in any other country, the great majority of the population are men of business.

If therefore French Conservatism is to effect anything in politics, it must subject itself to a long course of very distasteful discipline. To begin with, it must convince the nation that it is not intriguing against existing institutions. There may be some things in the recent administration of the Republic which a large number of Frenchmen think imprudent and unnecessary. But so long as the alternative is the overthrow of the Republic, the cost of getting them remedied will be more than the nation is prepared to pay. As yet there has been no serious effort on the part of the Conservatives to convince the nation that the Republic would be safe in their hands. Indeed, we may go further, and say that there is abundance of evidence that the Republic would not be safe in their hands. Now that the democratic section of the Bonapartists has repudiated "compromising alliances," all the regularly enrolled members of the Conservative party are more or less Royalists. The least pronounced type among them is probably that represented by M. HERVÉ, who was elected last Sunday for one of the arrondissements of Paris. He is described as a man who prefers constitutional monarchy; but, while this is unattainable, will put up with a constitutional Republic. If all the members of the coalition were of M. HERVÉ's way of thinking, they might have the sense to postpone their abstract preferences to the practical needs of the country. But M. HERVÉ stands out from the rest as exceptionally well disposed towards the Republic; and, if he and his allies were now forming a Government, he would almost certainly be unable to restrain their monarchical enthusiasm within any rational bounds. So long as this is the case, the abstention from monarchical speeches on the eve of a critical election will make no impression on the nation. The feeling throughout the country will be that under the plea of Conservatism these men are really preaching a restoration, and that by the side of such a possibility the Republic, even if it be a little more advanced than it might be, is the Government to support. At present there are no signs of that abnegation of personal preference which must be the first step towards success on the part of the French Conservatives.

Supposing, however, that this preliminary step has been taken, and that Republican institutions have been honestly accepted as those under which it best suits Frenchmen to live, the Conservatives will still have a great deal of work before them. The feature in government that is likely to make most impression upon Frenchmen is administrative success; and if the Conservatives are to replace the existing majority in the Chamber of Deputies, it must be in virtue of their supposed possession of greater administrative powers. It is not easy for an Opposition to show this, inasmuch as the demonstration has to take the form of criticism on Ministerial blunders. Still, if criticism lacks the opportunities which a government can command, it is also saved from the discredit of making mistakes. Its promises are not liable to be falsified by results; it cannot be compelled to put its suggestions to the decisive test of experiment. Year after year it may go on finding out weak places in its adversary's budgets, and pointing out, with the wisdom that comes so abundantly after the fact, the reasons why they have failed to do the good that was expected of them. The line, in fact, that is marked out for the French Conservative members by the hard necessities of their political position is very much that which was pursued with so much success by Sir ROBERT PEEL between the year 1835 and the year 1841. Unfortunately it is one for which the French are eminently unsuited. Their political zeal, like their mili-

tary courage, is most conspicuous when they are pushing home a successful attack. For the wearisome task of making preparations for a successful attack years hence they have little aptitude. Yet, in default of this faculty, there seems but little possibility of success in reserve for them. Unexpected dangers may await the Republic, but for the present it can afford to despise the hostility of its avowed foes. It is fair, however, to say that in the municipal elections in Paris, the Conservatives have shown more wisdom and more zeal than could have been looked for. They contested a large proportion of the arrondissements, though in many of them their candidates had not a chance of carrying the seat. They brought 50,000 voters to the poll, whereas in 1878 the Conservative voters were under 10,000. These are real advances, made under circumstances of very great discouragement, and they have met their reward in a gain of several seats. This is the kind of strategy that the French Conservatives ought to adopt at all elections. They should keep themselves before the mind of the public, not as a knot of dynastic intriguers, but as a political party working within the limits of the Republican Constitution for the attainment of certain practical ends. In the present condition of France this can only be done by bringing forward a much greater number of candidates than can possibly be returned. The object is to make people realize that they are a possible force in politics; that they have given up the alternatives of abstention and conspiracy between which they used to oscillate, and that they are making a serious effort to influence, and eventually to guide, the policy of the Republic. To bring about this, every seat ought to be contested and every voter brought to the poll. A really zealous party is almost certain to gain to itself a certain number of recruits; and even small additions to a minority, if they are constant and general, create by degrees an impression that the party which registers them is gradually gaining ground, and will some day have to be seriously reckoned with. The defeat of the Communists in the Paris elections may perhaps help the Conservatives to realize more clearly what is before them. The anarchy to which they have looked forward as their destined opportunity is still very far off.

SMALL-POX HOSPITALS.

DR. BREWER has brought a very serious charge against the inhabitants of Hampstead. They are responsible, he hints, for most of the suffering that will be caused by the new epidemic of small-pox. The Metropolitan Asylums Board, of which Dr. BREWER is Chairman, burn to do what they can to mitigate this terrible scourge. It is impossible, indeed, to imagine a public body in a more intensely sensitive condition than they are at this moment. "No men," says Dr. BREWER, "know better what is the liability of the 200,000 unvaccinated persons among a mass of well-nigh four millions." The Board has risen superior even to the benumbing influence of familiarity and habit. "The sufferings to which we minister," they say, "quicken, not deaden, our sympathies." But for the present they have no power to give effect to their sympathies. The timely isolation of infected persons is one of the most effectual means of checking the spread of the disease, and the timely isolation of infected persons cannot now be carried out beyond the narrow limits within which it has already been effected. The managers "are unable to enter the market for new sites, or to appropriate any additional building." In this respect they are paralysed, and they have authorized Dr. BREWER to explain to the public why they are not responsible for the suffering and mortality which they anticipate, but cannot provide for. We question if any of our readers who have not seen Dr. BREWER's letter will guess what it is that has reduced the Metropolitan Asylums Board to this helpless condition. It is the people of Hampstead. In that favoured district the managers have built a small-pox hospital, from the use of which they are now debarred by injunction. The legality of this injunction will shortly be decided by the House of Lords, but until it is decided the managers can do nothing. The Hampstead hospital is an integral part of a vast design for protecting the whole of London against small-pox, and a design from which an integral part has been removed is not one that can profitably be put into execution. The pertinence

Dr. BREWER's argument is not, it must be confessed, very obvious. The fact that an injunction not to avail themselves of the Hampstead site has been obtained against the managers is an excellent reason for not again opening the Hampstead hospital. What is not quite so plain is why it prevents them from opening similar hospitals in other districts. Even if everything that the managers contend for is conceded to them, they are still a long way from the point they seek to establish. Though the Hampstead hospital was an integral part of their scheme for protecting London against small-pox, it was not the whole of the scheme. All the small-pox patients in London were not to be sent to Hampstead for treatment, but only those who live in the north or north-west. At present the epidemic is worst in the south-east of London, and is seemingly on the increase in the south-west. Why as regards these districts, far enough away from Hampstead in all conscience, should the managers be paralysed by the prohibition to send patients to Hampstead? What prevents them from going into the market for sites in other parts of London? If it did not seem indecent to suggest such an explanation in reference to so august a body as the Metropolitan Asylums Board, we should be inclined to say that the exaggerated importance assigned in Dr. BREWER's letter to the Hampstead case was due to temper. The managers have been opposed, and up to this time successfully opposed, and they are not unwilling that the people of London should see that the Metropolitan Asylums Board cannot be resisted without mischief coming of it.

Dr. BREWER's letter has not been left unanswered. In the *Times* of Tuesday, Mr. PEARSON HILL sets out a long list of facts, some of which he alleges to have been proved at the trial, while others have been established since. Whether Mr. HILL's deductions from the evidence given at the trial are legitimate we shall not attempt to decide. The appeal against the injunction is still to be heard, and the judgment then given may declare that what have been supposed to be facts are really fictions. It is permissible, however, to point out that, so far as the case has yet gone, the contentions of the Hampstead ratepayers have been justified, and that these contentions are of a kind that the Metropolitan Asylums Board are bound to take into consideration quite apart from any decision that may ultimately be given as to their legal rights. Mr. HILL maintains that when the hospital was first opened for small-pox patients Hampstead was absolutely free from small-pox, though, as was shown by the circumstance of a special hospital being required for its treatment, the disease was severely felt in other parts of London. This immunity did not long survive the opening of the hospital. In less than a month small-pox broke out in Hampstead—the death-rate in the houses adjoining the hospital grounds being more than six times as great as in the rest of the parish. Six years later the hospital was again opened, Hampstead, as before, being absolutely free from small-pox at the time. In less than three weeks small-pox once more broke out, and the proportion of cases in the houses nearest to the hospital was again very much larger than in the rest of the parish. Now that the hospital is closed, Hampstead is, as before, free from small-pox, though it has again appeared in London. Mr. HILL is not satisfied with pleading the actual experience of Hampstead. He says that at the trial similar facts could have been proved as regards the Homerton and Stockwell hospitals, had not the counsel for the Asylums Board resisted the production of this evidence on technical grounds; and that the re-opening of the Homerton hospital has been followed by a fresh and serious outbreak of small-pox in the immediate neighbourhood. Further, he contends that the whole system of large hospitals is condemned by results. There have been many more deaths from small-pox in London in the twelve years since the Asylums Board was constituted than there were in the previous twelve years; so that the "timely isolation of the infected," on which the managers principally rely, has proved no real protection. The system of large hospitals is not even an advantage to the patients themselves. The death-rate in the hospitals is more than twice as great as it is among patients of the same class, when nursed even in their own miserable homes, and more than six times as great as it is among patients treated in small infirmaries.

The issue raised by this part of Mr. HILL's letter is quite distinct from that raised at the trial. The House

of Lords will simply have to determine whether the Asylums Board have a statutory right to place a small-pox hospital at Hampstead, and whether, even if they have this right, they are not bound to make compensation to the persons injured by such a hospital being opened in their immediate neighbourhood. Supposing that the House of Lords decides that such a statutory right exists, and that the Asylums Board cannot be made to pay compensation for injuries inflicted in the exercise of that right, it will be a very serious question whether this statutory right ought not to be further restricted. If it has been proved—and in the face of the facts stated by Mr. HILL we do not see how this can be denied—that the opening of a small-pox hospital does introduce the disease in a very virulent form into neighbourhoods previously free from it, two things seem to follow. The first is that these large hospitals should not be opened except in more isolated districts than Hampstead. The second is that, unless a very strong case can be made out for their necessity, they should not be opened at all. No district can complain if it has to bear its own share of disease; but to make a few selected districts bear the burden of all the disease of London can only be defensible when the least populated neighbourhoods have been carefully picked out for the purpose. Of course Mr. HILL's statements may be contested, and his comparison between the death-rate among small-pox patients treated in large hospitals and the death-rate among patients treated in small infirmaries may be shown to be inaccurate and misleading. But the current of medical opinion has not of late been altogether favourable to large hospitals, and it is plain that, if small-pox can be even as well treated in small hospitals, there are special reasons why that course should be preferred. If the managers of the Asylums Board are unable to open any more large hospitals while the issue of the Hampstead case remains undecided, they could not have a better opportunity of trying the experiment of small hospitals. The abridgment of the distance which the patients have to be conveyed must diminish the danger of their communicating the disease on the journey, and increase the chances of recovery, while the collection of a large number of cases may in some unexplained way make the disease more fatal to the sufferers and more infectious to others. The managers of the Asylums Board may not be disposed to accept any evidence against the large hospital system which is not founded on direct experiment, but they will be wanting in their duty to the public if they do not try the experiment for themselves.

CURATES IN THE EIGHTEENTH CENTURY.

OUR modern writers of fiction, if not our personal experience, have brought us all acquainted with the curate of the present day in his social aspect. His prospects, his ambitions, the classes and circles which afford the arena for his social successes—we do not now touch on the graver bearings of his office—have all been the theme of living painters of manners. The curate has a place of his own very distinctly marked, for example, in the novels of Mr. Trollope and Mrs. Oliphant, not to mention innumerable others; and in all these points we notice a difference between the literature of the eighteenth and that of the nineteenth century. We gather indeed from all records that the curate of former days had an important and prominent part to play, but we hear comparatively little about him. The parsons that figure in the novels and the essays of what one may call the classical social history of the past century are incumbents, holders of the benefices they serve, or possibly London curates who have deserted their country livings for a position more suited to their aspirations or to the display of their gifts. Whether this shows the office to have been held less in permanency than is the case now is beside our present purpose; what we observe is that curates, as such, are not conspicuous in pictures of eighteenth-century social life as given to the world in those days. There are, however, memorials of those times brought together by industrious collectors, which, while throwing light on the state of discipline in the Church, let us see a good deal of the labours and remuneration of curates. A hundred, and, still more, a hundred and fifty, years ago people were very artless in their private correspondence on the temporalities of the Church, and did not disguise their solicitude how to get their share of them, how to keep what they had got while seeking to get more, how to get the pay and let others do the work.

It is, however, easy to be too severe on the keen interest shown in those days in the Church's temporalities. A battle had to be fought on this ground as much for the sake of the humbler laity as of the clergy. Self may have had too large a share in the contests for clerical rights; but without a personal concern in the

question such struggles are rarely ventured upon, and then they are apt to become severe tests of temper and discretion. But the Church of our day profits by the disputes which then set parsons and farmers by the ears, not by any means generally to the blame of the parsons. Records of the time are full of notices of these contests, showing incidentally a ground for non-residence. We read of a Leicestershire rector (1761) "who, having done much for himself and his successors by setting aside a pretended modus and raising the value of the living, by no means beyond what was just and equitable, could hardly ever appear without receiving those insults which the clergy too often experience on similar occasions." In this case the rector (Thomas Ball), having carried his point, put a curate in charge, and himself procured the common object of clerical desire, "a licence to reside in Town," and took the curacy of Bloomsbury. London curacies and lectureships were a very acceptable refuge, both on social grounds and also as high roads to promotion in some form or other.

The rector of Kettering, described as "the learned and conscientious divine, the Rev. Thomas Allen," who came to the living in the year 1715, carried on a thirty years' contest with the patrons of the parsonage, maintaining a temper which wins the admiration of the reader. These patrons, by virtue of certain lease transactions in Elizabeth's reign, claimed to exercise the right to all rectorial tithes; and, regardless of the depreciation in the value of money, tied down the rector's salary to the original sum of 40*l.* per annum. While appealing at once to law and to conscience, the rector proposed the most modest compromise—if only they would raise the income to a sum equivalent to the first endowment granted; if only they would give 200*l.* to enable him to publish certain religious works he had in hand; but they stuck to the letter of precedent and their claim. At length he put his "Complaint" into Chancery, where his rights were recognized, and the value of Kettering now stands in the Clergy List at 1,000*l.* per annum. This affair throws some light on the progressive income of curates. In Elizabeth's day a curate's salary was 10*l.*; now, the Rector argues, "I cannot get the duty done [in case of leaving the living in charge] under 40*l.*" Thus he writes in 1720, when probably the sum was in excess of the customary standard. In lines written later in the century the poet seems to show this:—

And passing rich with forty pounds a year.

We find 20*l.* and 25*l.* often stated as the amount of a curate's salary. Thus Magdalen College (1744) annexes a curacy of 20*l.* to Coningsholme, near Louth; and the curacy of Mlesfield, near Oxford, is 25*l.* per annum "at most." A writer from Wales (1758), pleading for a more learned clergy, and the necessity of a less costly education than that given by our Universities, argues that "gentlemen who have had the advantage of a learned and polite education will hardly take upon them the fatigue of serving three or four churches for the trifling consideration of 25*l.* a year."

This touches upon another distinguishing feature of curate life in the last century. Owing to the prevalence of non-residence, unavoidable in many cases where several preferments of small value—of 50*l.*, 20*l.*, and even 10*l.*—were held by one man, villages in certain parts of the kingdom were frequently served by a perambulating ministry. This abuse was mainly confined to the Northern counties, where alone, as a rule, it was possible to take holy orders without the preliminary of a University education. Persons not long passed away could remember these pluralists of curacies, hurrying from parish to parish, their horse waiting for them at each church gate; and noted, if not boasted of by their congregations, as marvels of rapid delivery. Swift put into verse the complaint of hard duty of one of these overtaken drudges of the sanctuary:—

I marched three miles through hottest sand
With zeal in heart, and notes in hand;
I rode four more to Great St. Mary,
Using four legs when two were weary.
To three fair virgins I did tie men
In the close bands of pleasing Hymen;
I dipp'd two babes in holy water
And purified their mothers after.
Within an hour and eke a half
I preached three congregations deaf;
Where thundering out with lungs long-winded,
I chopp'd so fast that few there minded.
My emblem, the laborious sun,
Saw all these mighty labours done
Before one race of his was run.
All this performed by Robert Hewit;
What mortal else could e'er go through it?

Whether sermons thus delivered were preached in pure Saxon English, or in a language less in accord with a rustic vocabulary, signified probably but little; but when by accident a multiplication of cures was held by a scholar open to the difficulties and evils of such a system, we learn some of the consequences of it. A certain Reverend Christopher Hunter, of Sidney Sussex College, writes from Lynn (in 1770) to a clerical friend whose duty lay in London:—

What do you think of four churches for one man? Too much in conscience, I think I hear you say; this, however, is exactly the case with me at present. I was rather seduced into the fourth, as the Rev. Mr. Greene (whose place I am supplying) mentioned only three to me, because, forsooth, one is dropped every Sunday.

He receives his friend's sympathy, which induces him to follow up his report:—

Lynn, Dec. 23, 1770.—You rightly suppose that my present situation is not the most agreeable in the world, and yet I dare say you have no

notion of the circumstance that makes it most unpleasant to me. It is not the labour of the employment, the length and badness of the roads, not the inclemency of the seasons—these I regard not; but it is the extreme ignorance and misery of my parishioners. When I say that there are not in my four parishes above five people who can write, I believe I say the strictest truth; neither do I think there are above twice the number who can read. It is a more difficult matter than a London preacher will readily conceive to speak to an illiterate congregation in a manner they can understand. The commonest and best authorized word in composition, if it seldom is introduced into vulgar conversation, is certainly not made out by them; and as such words must continually arise in a discourse, the whole will of course lose much of its force; sometimes it will lose all. Whilst you are perusing this, you are comparing my poor flock with some old women in your parish, but your comparison is very deficient; the most ignorant old woman of your acquaintance, compared with the majority of my parishioners is a Doctor in all the faculties.

Dr. Johnson always recognizes the difficulties of the clergy on these points, and is touching in his apologies for the unavoidable difference between the Church's theory and practice in his day with respect to curates. He is as strong as any one in the present time can be on the necessity of a plain style in preaching to the poor, and also on the need of a resident clergy among them. He quotes Dr. Percy as saying "that it might be discerned whether or no there was a clergyman resident in a parish by the civil or savage manners of the people." He insists that sermons were not plain enough; that polished periods and glittering sentences flow over the heads of the common people without making any impression on their hearts; and, as a plea for the Methodists, admits that something might be necessary to excite the affections of the common people, who were sunk in languor and lethargy, and therefore, that the new concomitants of Methodism (he spoke before the schism) might probably produce this desirable effect. It proves that it was not a common endeavour with pastors to write sermons down to the intelligence of rustic hearers that we find him quoting to a young curate the experience of a learned friend, who wrote a weekly sermon for a humble congregation, though the salary was but 15*l.* a year, "which never was paid"; adding that when he could not himself reach the mind of a woman sunk in ignorance, he employed an intermediate agency to talk to her in a language level to her mind. That the ideal sermon of this period was recognized as above the comprehension of the poor, and was written without regard to them, is shown by the fact that early in the century we read of a distinct service, with sermon, for the benefit of the poor, of servants, and apprentices, being arranged for them at six o'clock in the morning, there being neither room for their bodies in the later morning service nor food for their mind in the sermon. It is not surprising to find that the curate told off for this service was denominated "underling" by any chance supercilious visitor. Yet London was clearly the land of promise for curates, as for others. A father complacently writes (1735) of his son, who had got into a scrape with his college, that "My son has now got upwards of 52*l.* per annum, but he labours hard for it, in three London churches. Morning Reader all Litany-days and occasional Preacher in one; afternoon Sunday Reader in another, and administers the Communion every Sunday morning between 6 and 7 o'clock in a third. He has a very audible voice, and behaves himself hitherto with great prudence." In higher clerical circles, it is curious to read, in connexion with later associations with St. Vedast's, of an election (1727) to the Tuesday evening Lectureship of St. Lawrence Jewry, a post evidently of some distinction, in the gift of certain of the parishioners. The assistant lecturer, who clearly had a claim, writes to a friend that "the Great Grasper"—by whom, a note informs us, is meant the Rev. Nathaniel Marshall, Rector of St. Vedast's—"on the occasion of this election is transforming himself into a Serpent," and by an ingenious ruse turning the eyes of the electors towards himself.

Of course, when things go on as they ought to do, they pass with little comment. Hence it is abuses, possibly abnormal and exceptional abuses, that catch the notice of posterity. They invited contrivance and arrangement, and there is always either some sufferer who feels a grievance or else some busy spirit feels it for him. Dr. Johnson knew some zealous parish priests, and had such in his thoughts when he spoke of regarding a clergyman as the father of a larger family than he is able to maintain, and added, "I would rather have a chancery suit upon my hands than a cure of souls." But, making every allowance, the records of the century do show a sort of common consent in getting the pay of an office without its work. There is not the least concealment in such transactions. The Rev. Zachary Grey was a distinguished clergyman with a large literary correspondence, and we find that, in answer to some inquiries of his as to the price of military chaplaincies, his informant takes for granted that Dr. Grey's notion of the value of the office depended on its being a sort of sinecure. The price of a chaplaincy in the Guards, he is told, is worth 800*l.*, bringing in 113*l.* per annum, out of which 8*l.* had to be paid for the work being done. "As to attendance in the Guards, none is necessary." "I presume also that little or no attendance is required in a marching regiment, if a man be well with his colonel. Soldiers are generally very reasonable upon that head." It is further explained that it was usual to make the colonel a compliment of fifty guineas in these transactions.

The bishops were not idle on the question of non-residence; at least there were not unfrequent remonstrances on their part, but no earnest popular response was made to them. In 1759 Sherlock, Bishop of London, raised a storm by giving in his Charge his own interpretation of the statutes concerning

residence, 21-28 Henry VIII., which exempt certain persons from residence; the Bishop arguing that the exemption only extended to the penalties, and did not release them from the obligation to reside without *also* a dispensation from the Ordinary. Upon this mention of the Ordinary a fierce cry was raised from some quarters of "No Popery," as threatening a return to the days when the clergy and people of the Church of England were in a state of abject slavery and bondage to the Pope of Rome.

Though we began by saying that the office of curate is more prominent in the gossiping records and clerical correspondence of the century than the holders of the office personally, yet there are portraits extant of men who as curates made their mark, and, by their zeal and self-denial, their virtues and eccentricities, left a memory of themselves in remote and obscure districts, which memory the reader would willingly believe is not yet lost in the scene of their labours.

THE THIRD IRISH PARTY.

AMONG all the speeches, many of them very weary ones, which the debate on the Address has produced, the palm of that interest which arises from curiosity must perhaps be awarded to the speeches of Mr. Charles Russell, the member for Dundalk, and to that of Mr. Shaw. In eloquence, in bearing on the question, and in many other things, Mr. Russell's utterances were not particularly remarkable. But they have an interest which is independent of their intrinsic merit. It may seem an idle attempt to mark off Irish parties with arithmetical precision. As many parties as there are members when (according to the old joke) each man is unanimous, and an indefinitely greater number when some of the members have not made up their minds, or are hunting half-a-dozen hares at once—this might seem to be the more correct enumeration. Seriously, however, and for the sake of convenience, there may be said to be three parties in the present Irish contingent to Parliament. There are the Home Rulers of all shades and shapes; there are the Constitutionalists, who are by the force of circumstances Tories almost to a man; and there is the new Third Party, which may either be regarded as the remnant of a former state of things or as the product of a new one. Formerly, Irish members were divided pretty definitely into Protestant and Roman Catholic, of whom the former were on the whole Conservative, the latter, though by no means universally, on the whole Liberal. These latter were a troublesome and untrustworthy portion of the Liberal forces, but they formed no small part of them. The invention of the Home Rule shibboleth has put an end to this state of things. A mere Liberal has now no chance in Ireland, and the result of this has been that, after the Home Rulers and the Constitutionalist Tories, comes a small band of persons, avowing ardent Liberalism, not professing Home Rule, but holding a creed not as yet very clearly defined, which is supposed to differentiate them from the older and now unpopular type of Irish Whig. As yet this party has but little homogeneity, consisting as it does partly of Ulster Radicals, who are the Irish counterpart of certain English members for borough constituencies, and partly of nondescripts. The recent meeting, however, by which the Ulster members have endeavoured to force Mr. Gladstone's hand, may be taken as an early effort, not destitute of vigour, of the third Irish party to give itself cohesion, to make alliances offensive and defensive with sympathizers in England, and, in short, to establish itself. The reported abjuration of Mr. Parnell and all his works by Mr. Shaw, if it be confirmed, may signal an important addition to its ranks, while the deputation of Wednesday still further enforced the policy of self-assertion.

If Mr. Charles Russell is not as yet the declared leader of this as yet not very coherent party, and if, for reasons not difficult to understand in connexion with his position as a prosperous advocate at the English Bar, he took no part in the deputation, he is certainly that member of it who has most reputation in England for ability. His return to Parliament was greeted at the time by loud felicitations from the Government organs on this side the Channel, and every occasion has been taken since to magnify his doings. Mr. Russell, as everybody knows, has written a series of letters, taking the part of the Land League, pooh-poohing the idea of terrorism being exerted, and echoing to the full the popular Irish description of the peasant as a downtrodden and persecuted being. His facts, it is true, have been denied, and his arguments completely exposed, but that does not matter. The persons whom they were intended to influence will probably not believe the denials, and may possibly not understand the exposure. Accordingly, it was with a certain amount of prestige that Mr. Russell got up the other night to extend the right hand of fellowship to the Home Rulers; to reproach the Government, more in sorrow than in anger, with the weakness of their intentions; to reiterate his description of the reality of the woes of the Irish tenant and the unreality of those of the Irish landlord; and to cement, as far as in him lay, the hitherto rather loosely banded stones of the edifice of the Irish Third Party. His particular utterances do not concern us here. It is sufficient to say that throughout them there was conspicuous the same twofold policy which has been obvious (with, of course, individual differences) in all the members of the party. On the one hand, so to speak, of this policy is the extreme compliance with the demands of the so-called Irish section of Irishmen, a compliance stopping short only of separation, and of that virtual separation which Home Rule

means, if it means anything. This compliance is obviously intended to attract, and may probably have succeeded in attracting, moderate Home Rulers of the type of Mr. Shaw and Mr. Mitchell Henry, as well as to secure the popularity of the party in Ireland itself. On the other hand, the policy of the party is to affect extreme Liberalism, as Liberalism is understood in England, and thus to make itself a valuable assistant to any Liberal Government of a Radical dye, and a power to be reckoned with by any non-Liberal Government or Government of a definitely Whig shade. Both in Ireland and in England, indeed, the advocates of what is called a strong land measure, and the opponents of what they themselves pleasantly call a "resort to violence"—that is to say, the putting down of anarchy and terrorism by the strong hand—use the existence of this embryo party as an argument in their favour. According to this contention, which has a charming *naïveté* about it, the only chance of preserving a Liberal party in Ireland at all is to satisfy the demands of the would-be land-stealers. Otherwise, it is urged, or confessed with a melancholy simplicity, the last hold on the Irish century of members is lost to Liberalism, and the contribution of Ireland to the Imperial Parliament must in future consist of Home Rulers becoming more and more Nationalist, and of Constitutionals becoming more and more Tory. "Avert it, Heaven!" is the cry of English partisan Liberals and of the Irish Third Party; and both agree that it can only be averted by liberally distributing the property of the landlords among the tenants. So shall the third Irish party grow and flourish; and, instead of some half a dozen members, muster some half a hundred—so shall Toryism be driven out of Ireland and rendered powerless for that evil which, as is well known, is the only thing for which Toryism is powerful at all.

We have said that there is something not a little attractive in the extreme simplicity of this plea. It has been noticed, both in public and private life, that the most ostentatiously moral and conscientious people are wont to give themselves leave to do the most curiously immoral things, and this is not the first instance in which the supporters of the present Government—which came in with righteousness written on its forehead and justice held up with both its hands—have resorted to arguments and have urged considerations which savour of a very curious ethical standard. It is not long since, as a member of the Government has ingeniously confessed, the English farmers were rewarded for their vote at the last election and bribed for their vote at the next by the Ground Game Bill—that is to say, that one class of the people were mulcted for the benefit of another class in the first place, and of a political party in the second. The proceeding is now to be repeated in Ireland. The Third, or definitely Liberal Irish Party, is to be established and endowed at the cost of the Irish landowners. No matter whether the thing is economically defensible or not, no matter whether it is politically advisable or not from the point of view of national and Imperial advantage, no matter even whether it is for the true benefit of Ireland, it is necessary to the existence of a phalanx of devoted supporters of a Liberal Government in Ireland; and therefore, cost what it may, it must be done. The Nationalist is shaken in the faces of the Government and of doubting English Liberals with one hand, the Tory with the other. If you want Irish allies you must pay for them, and, happily, there is an opportunity of paying for them at the expense of nobody but the Irish landlords, a race accustomed to be plundered, almost defenceless, and, as being very generally Tory, worthy of no pity whatever.

The morality of this argument for the establishment and endowment of a Third Party in Ireland needs absolutely no further comment. It is probable that the value of their proposal in plain language has not occurred to most of the persons who made it, for nothing furnishes a man with such curiously tinted spectacles for the mind's eye as political partisanship. But it is worth while perhaps to point out that the proposal is as politically shortsighted as it is morally discreditable. You can't buy the Danes off, for the simple reason that they always come again and increase their demands. If anybody supposes that the concession *sans phrase* of the three P's to-morrow would secure to the Liberal party the undying gratitude of Ireland and the possession of a safe majority, or even a good number of Irish seats, he must possess a charming ignorance both of Irish history, of Irish character, and, it may be added, of human nature. Just as the Home Rulers trumped the cards of the old Irish Catholic Liberals, so will new and more adventurous adventurers trump the cards of the new Third Party in time. Indeed, the tactics of that party itself at the present moment are not encouraging to the fond believer in fixity of political tenure. They do not declare themselves Home Rulers, they are avowedly loyal to the Constitution, but they play into the hands of the separatists, and they evidently wish to attract into their own ranks the most moderate of that faction. Most people know what happens in such cases. The converts convert the party they have joined at least as often as they resign their errors wholly and finally. Besides, the political complexion of the new Irish Liberal on matters of general politics is wont to be much more of the Radical than of the merely Liberal type, and it is notorious that Radicalism does not, and indeed cannot, acquiesce in finality of any kind or in any doctrine of Imperial indivisibility. What we are really asked to do is to weaken once more the garrison of the Constitution in Ireland—a garrison weakened enough already, in all conscience—to what the appetites of the spoilers once more for new spoil; to commit an act of injustice more or less flagrant, as the case may be; to set a precedent certain to

be applied still nearer home before long—and all for the sake of establishing in a fancied security a certain political party in the possession of the Irish representation. That the scheme is immoral, not to say impudent, is self-evident; that it is in the highest degree politically unwise appears from the smallest consideration. Yet it is this scheme that the existence of the embryo third Irish party, the letters and speeches of Mr. Charles Russell, the applause and the arguments of English Liberals, really and truly signify. We do not remember that the doctrine that it is allowable for a political party deliberately to tamper with the property of the Queen's subjects and the prosperity of the Empire in its own interest has ever before been so nakedly put forward. It is for Englishmen of course to decide how they like this doctrine and its present application.

MR. HUBBARD ON A RELIGIOUS CENSUS.

WHEN the Census Bills were introduced at the close of the last Session, the omission of any provision for a religious Census was explained by two reasons so conspicuously inadequate as to supply little more than a decent pretext for conforming to the avowed demand of the Nonconformist supporters of the Government, as formulated by the Liberation Society. The previous history of the question is a curious one. The Census Act, of 1850, included no direction for a religious Census, but the importance of a knowledge of such statistics to statesmen is so obvious, as Mr. Horace Mann points out in his *Report to the Registrar-General*—that some kind of informal permission appears to have been obtained from the Government—though no record of it is preserved—for “endeavouring to procure information as to the existing accommodation for public religious worship.” We have the result of this “endeavour” in the so-called Religious Census of 1851, to which we shall have occasion to return presently. In 1860 it was originally intended to remedy this serious omission and the Census Bill was accordingly presented to the House of Commons with a provision for obtaining the religious profession, as well as the age, sex, and occupation of every member of the community. But the new provision was strenuously opposed by the Nonconformists, and Mr. E. Baines moved its rejection on their behalf. He was answered in a telling, not to say biting, speech by Sir George Cornewall Lewis, who pointed out how serviceable such information would be found in all civilized States—England in this respect stands nearly if not quite alone—how fanciful were the alleged difficulties and objections; and how strange was the inconsistency of the several sects in protesting against an official record of their religious profession while their very protests constituted an ostentatious display of their nonconformity. Nevertheless the Government yielded to the pressure put upon them, and the clause was withdrawn from the Bill. Mr. Baines again opposed the introduction of a similar clause into the Census Bill of 1870, and again the Government gave way, Lord Palmerston however being careful to explain that he deferred to the feelings of the Dissenters, but could not assent to their reasons. The House of Lords restored the omitted clause, but it was again struck out by the Commons. We have seen already that no attempt was made to insert such a provision in the bill of last year, the only reasons alleged being that it would cause some delay and increase the expense of the Census, to which it is sufficient to reply that the comparative increase whether of time or of cost would be hardly appreciable. The real reason of the omission was notorious, and is set forth and discussed with a quiet and incisive force in the article Mr. Hubbard has contributed to the *Nineteenth Century* of this month on “A Census of Religions.” It so happens that the Liberation Society has spared us the trouble of searching at second hand for the ostensible grounds of their objection by publishing an authorized “epitome,” which was reprinted with warm commendations by the *Nonconformist* in July last. Mr. Hubbard justly insists on the importance of the document as embodying the principles and arguments on which the Nonconformist members of Parliament and their allies are content to base their opposition, and, as such, we shall present it in full to our readers. But it may be well to premise one general observation, the truth of which will indeed at once be obvious to any ordinary reader. The needle is wrapped up—we can hardly say hidden—in a very considerable bundle of hay, and if the “padding” was left out, the seven reasons of the Liberation Society might easily be reduced by six. The Epitome of “Objections to a Census of Religious Profession” runs as follows:—

1. *The inquiry is unwarrantable.* What right have Government officials to question us about our religious, any more than about our political professions? The only place where they can be legitimately elicited is in the polling booth.

2. *The inquiry is absurd, or unreasonable.* How can every hotel-keeper, every lodging-house keeper, every master, and every head of a hospital, or prison, or poor-house, make a truthful return of the religious profession of “every living person” who happens to have slept under a certain roof on a particular night? The inquiry would in many cases be resented as an impertinence, and if the facts were guessed at, instead of ascertained, they would frequently be, not facts, but fictions. It would be unjust to householders and inmates alike.

3. *The result would be misleading, because of the ambiguity of the inquiry.* What is “religious profession”? Is it what a man believes, or only what he professes, or what he says that he professes. Or if it means what religious body does he belong to, what is belonging to a religious body? Then there are many persons who cannot really define their religious profession, and why should they be obliged to attempt to do so, or be punished if they refuse to make the attempt?

4. *The return would be incomplete, because it is well known that a large number of persons would, on conscientious grounds, feel bound to refuse the information sought for, and many would refuse on other grounds.* And if the enumerators attempted to supply it, they would inevitably blunder.

5. *The return would prove fallacious and grossly misleading.* Large masses of the people make no religious profession; but, because they will not like to acknowledge the fact, they will reply, “Church of England.” The effect would be to produce the impression that the Church of England has a far greater body of adherents than all the other religious bodies have, and that is the object of the suggested Religious Census. It is wished to use what would be really inaccurate, and in many cases dishonest returns, for a political purpose.

6. *The inquiry would lead to coercion and sectarian rivalry, and would occasion great bitterness of feeling.* Many of the Established clergy and their adherents would use all their influence to induce their dependents and the poor to return themselves as Churchmen, and numbers of persons would be too ignorant or too weak to resist such pressure.

7. *The inquiry would be contrary to the true purpose of a census.* That purpose is to obtain statistics which are likely to be accurate, and to ascertain facts which can be verified, and not opinions or professions which are necessarily vague and ambiguous, or unascertainable. A census of the population ought to be taken with the good will of the population: whereas such a Religious Census as is suggested would excite anger and resistance, and make the census odious to a large class of the people.

It would be a waste of time to expend any very minute criticism on these seven points. The two first may be met by a direct negative. An inquiry which is confessedly useful for the State, and which can be prosecuted without any real difficulty is neither unwarrantable nor unreasonable. And as to the alleged “impertinence” there is certainly a far larger section of the country who “resent” the inquiries on the delicate subject of their age, which every householder is compelled to make by the existing law, than would be offended by being asked to state their religious profession. The third and fourth objections are almost captious, and would only prove at the outside, as Mr. Hubbard points out, that the return might after all be numerically incomplete as regards the entire population, while it would remain complete and exact as regards the relative proportions of the different religious bodies. But the fifth objection goes to the root of the matter. “The effect would be to produce the impression that the Church of England has a far greater body of adherents than all the other religious bodies have.” *Hinc illa lacryma.* The result might very possibly be what the Liberation Society anticipate, but when they go on to argue that this “is the object of the suggested Religious Census,” we must take leave to remark that the object of a religious Census as of every other kind of Census, is simply to ascertain facts. If it is a fact that the members of the Church of England outnumber the members of all other religious bodies in the country put together, the sooner it is clearly ascertained to be such the better; if on the other hand, it is not a fact, the result of a religious Census would be to dissipate an illusion which is very widely entertained. As to the contention that “large masses” who make no particular religious profession would describe themselves as members of the Church of England, the answer is that they have a perfect right to do so, if they please, though the apprehension is probably a very exaggerated one. You cannot go behind the description people choose to give of themselves in such cases, and there are other Communions besides the Church of England which have many merely nominal adherents. What concerns the statesman to know is not so much what are a man's private convictions or devotional habits as to what religious communion, if any, he outwardly belongs. And the unreasonableness of this particular form of objection becomes more manifest, when it is reinforced by the further suggestion that many of the Established clergy and their friends would put a pressure on the poor and ignorant too strong to be resisted to return themselves as Churchmen. Even supposing there was true ground for what is in fact a purely arbitrary conjecture, are the clergy of the Established Church the only class of religionists or religious ministers who can be suspected of the desire or capacity to exercise this sort of moral coercion? The circumstances connected with Mr. Horace Mann's Report in 1851 do not at all bear out such an inference. But the Liberation Society supplement their objections to a *bona fide* religious Census by the assurance that they are heartily in favour of what they are pleased to term the fullest and fairest religious Census on the lines of that taken in 1851, which would alone, they think, command the good will of the population. Let us inquire therefore a little more closely into the method then pursued and the probable value of the result.

As to churches and chapels, there were reported to be 14,077 buildings with 5,317,915 sittings belonging to the Church of England, and 20,399 buildings with 4,894,648 sittings distributed among the various Dissenting bodies. And the statistics of attendance at public worship in the morning, afternoon and evening of the “Census Sunday,” supplying by estimate defects in the returns, gave a result of not quite 5 million and a half for the Church of England, and about 6 million and a half for the Nonconformists. By a further calculation that one-half the afternoon and one-third of the evening attendants had not been at the morning service, Mr. Mann deduced a total of about 3 million and a half Dissenting worshippers and about 300,000 more of the Church of England. From these somewhat conjectural data—which, it will be observed, leave over half the population unaccounted for—coupled with a still more arbitrary assumption as to the increase of Nonconformist places of worship since 1851, the Liberation Society have framed their computation that Nonconformists constitute a majority of the population of England and Wales. Now in the first place the attendance at worship on a given Sunday, even if the returns were thoroughly

trustworthy, would offer a very inadequate criterion as to the relative numbers of different Communions, and leaves open a wide field for conjecture as to the religious profession of the ten millions and more who from whatever cause were not at church on the Census Sunday. There is much force in Mr. Hubbard's suggestion that separatists from the national Church are, from the nature of the case, likely to be inspired with a special zeal and *esprit de corps* of their own—also why did they separate?—and this would be intensified in proportion to the newness and smallness of the sect to which they belonged. It is obvious e.g. that a far larger proportion of Mr. Voysey's followers than of the members of the Church of England would be likely to attend their worship on a given Sunday. And it must be added that tea parties in their chapels and other special devices for securing an additional attendance on Census Sunday were reported to have been freely adopted by the Nonconformists in 1851. As regards the alleged increase of Nonconformist chapels since 1851, the ascertainable statistics seem to point just the other way. Mr. Mann estimated the number of those buildings in 1851 at 20,390. There have been several hundred annual additions to the number of registered chapels since, yet by the end of 1878 the total number had fallen to 10,977, and has fallen now to 18,723. The explanation appears to be that "Dissenters' Chapels have no permanent character," and consequently a constant "expurgation of the register" goes on alongside of the periodical additions to the list, and then there was an excision of nearly 2,000 chapels in 1876. Nor will this surprise us, when we bear in mind the character of the buildings registered for religious services, which include e.g. besides regular chapels, "music halls," "schoolrooms," "amphitheatres," "vestries," "temperance halls," "occupied houses," "rooms in a house," "cottages," "club-rooms," "railway arches," "bakehouses," &c. The difference between such places of worship and a consecrated church becomes obvious at once. The latter must be free from debt, and under certain Acts must have an endowment of 5,000*l.*; the former may be built with borrowed money and mortgaged to its full value or may be merely hired, partially or exclusively, for purposes of worship. "A church with 1,000 seats may have cost 10,000*l.*, and the endowment raises the outlay to 15,000*l.*, but a lecture-room or dancing-saloon with the same capacity may be hired for the whole or part of Sunday, and besides the rent the only condition needful to ensure its registration is a fee of 2*s.* 6*d.*" The fee for a marriage license costs 3*l.*, but less than half the chapels registered at present are licensed for marriages.

If we turn to such other data as are available for framing an estimate, in the absence of any regular Census, we do not seem to find any confirmation of the statistics of the Liberation Society, but rather the reverse. In the returns for the year 1870, the latest before the establishment of Board Schools, the proportion of children, in primary schools under inspection, who were in Church Schools was 72·6 per cent.

Of 190,054 marriages in 1878, 72·6 per 100 were of the Church.

Of 32,361 seamen and mariners employed in 1875, the percentage of Churchmen was 75·5.

The army of 183,024 men, having in 1870 as many as 2·50 per 100 Roman Catholics, still showed a proportion of Churchmen equal to 62·5 per cent.

Of 101,458 adult inmates of workhouses in 1875, the proportion of Church people was 79 per cent.

Of 22,677 prisoners in gaol in 1867, the proportion returned as Churchmen was 75 per 100.

The number of Nonconformist chapels supplied to Mr. Mann contrasts strangely with the number of "Ministers" recorded in the enumerated Professions of the Official Census of 1851. In that Report the Clergy of the Church are stated at 17,320, and the Ministers of all other denominations at 8,658.

One expects to find some proportion between the number of the shepherds and the number of the folds into which they gather their sheep; but while the Clergy considerably exceeded in number the churches in which they officiated, Nonconformist ministers of all sects do not in number equal one half of the buildings for worship which are said to have been provided for them and are appealed to as an evidence of progress.

These statistics would rather serve to suggest that three fourths than that less than half the population belonged to the Established Church. We do not say that such an estimate would be correct, but we do say that a genuine Religious Census can alone satisfactorily settle the point in dispute, that is a Census conducted on the principle of direct inquiry into the personal religious profession of individuals, not one based on doubtful calculations derived from more or less precarious statistics of attendance at public worship on some one particular Sunday in the year, which are sure to be disputed and almost sure to be misleading. Meanwhile the broad fact already referred to stares us in the face that England is singular among European nations in dispensing with such a census; we say advisedly England, not the British Empire, for there is a religious census in Ireland. Nor is it easy to understand why the Dissenters should object so strongly to being "labelled," unless they are afraid that the result of the labelling might not prove advantageous to their claims. We forget whether it was Sir G. J. Lewis or Lord Palmerston who told them that, while deferring to their unaccountable sensitiveness about the avowal of their religious profession, he hoped they would some day see their way to getting over a difficulty in carrying out the ordinary programme of all civilized States, which had already been surmounted by the Turks.

MR. BRADLAUGH AND M. LAISANT.

HOWEVER heartily the members for Northampton may agree about political, they are scarcely in harmony about social, questions. Perhaps we should say that they are at variance about their private foreign policy. Mr. Labouchere sends challenges, Mr. Bradlaugh declines them. A tolerant French journal has observed that Mr. Bradlaugh could not fight because his constituents would be wroth with him. But we do not know that the intelligent electors of Northampton ever found fault with Mr. Labouchere because, some time ago, he did want to fight. Where members of Parliament so closely united in opinion differ, it is not easy for impartial judges to come to a definite conclusion. Should Mr. Bradlaugh have gone out with M. Laisant? We reserve our own ideas, and must promise that the nature of the quarrel between these eminent Liberals is obscure. What was it all about; *quo numine læso*, did Mr. Bradlaugh say to M. Laisant, in language as Parliamentary as possible, that he was a coward? The origin of the wrath of Mr. Bradlaugh seems to have been M. Laisant's insinuation that the chosen of Northampton had dined in company with the Duke d'Aumale. Whether M. Laisant called Mr. Bradlaugh "a Prussian spy" seems uncertain. Very likely the story of the dinner may appear a frightful calumny to a French Radical; but in England it does not sound so very terrible. Democrats, among us, not only dine with dukes, when they get a chance, but are far from attempting ignobly to conceal the action. Indeed, if what M. Laisant said was false, Mr. Bradlaugh was not the person implicated who had the best reason to be aggrieved. If the Duke d'Aumale had challenged M. Laisant, his motive would almost have been intelligible. But Mr. Bradlaugh is really too exclusive. Dukes, after all, are "our own flesh and blood"; and probably Mr. Gladstone himself would not rudely decline an invitation from the Duke of Sutherland. Perhaps the sting of the charge was the implied opinion that Mr. Bradlaugh, and the Duke d'Aumale, and M. Emile de Girardin, and a French lady of recent notoriety, had all conspired at dinner against the Universal Republic.

Whatever the origin of the quarrel, Mr. Bradlaugh put himself in the wrong when he called a Frenchman a coward, and then declined to receive his challenge. We do not exactly know what an Englishman is expected to do when he is called a coward. Public opinion forbids him to fight. The philosophy of horsewhipping is obscure; but, if the accuser is a big strong man, and the accused weighs nine stone in his boots, the latter will gain little by attempting an assault. As a consequence of this state of things, gentlemen do not call each other cowards, nor (out of Parliament) use language for which it is impossible to give satisfaction. But Mr. Bradlaugh chose to neglect this rule of controversy, and he chose to neglect it when his adversary was a Frenchman. He therefore quite deserves the scrape into which he has got himself. No Frenchman who is in a conspicuous position, or rather who is trying to make himself a position, could possibly swallow Mr. Bradlaugh's insults. He was bound, by the manners of his country, to send friends to Mr. Bradlaugh. In fact, Mr. Bradlaugh put himself entirely in M. Laisant's power. If he apologized, he would disgust even the robust moral sense of Northampton. If he fought, all England would have laughed, and, not improbably, he would have made acquaintance with "the business end of a duelling sword," as the Americans would say. If he neither fought nor apologized, but blustered, which he has chosen to do, he gave M. Laisant his chance to "treat this false democrat with the contempt he deserves."

Having begun by behaving indiscreetly, Mr. Bradlaugh did not show much dignity in his later conduct. He wanted not to fight, and yet to show that he was not personally afraid. He therefore declined to hold communication with M. Laisant's seconds, but he gave M. Laisant a minute account of the places where he could be found. This meant, if it meant anything, that he did not dread M. Laisant's prowess in a personal scuffle. There are two stools, so to say, in this affair—a French stool and an English one—and Mr. Bradlaugh tries to sit on both. He addresses insults to M. Laisant in a style which we do not tolerate at home. He provokes him, in fact, in the French manner, and then he wishes, when a duel is proposed, to behave in the English manner. Of course his present attitude is undignified and inconvenient. We admit that it would be very disagreeable for Mr. Bradlaugh to meet M. Laisant in the French way. It is very unlikely that the English champion is a master of the sabre or the small-sword. It is very probable that he would only succeed in giving M. Laisant an easy chance of distinguishing himself as a duellist. Mr. Bradlaugh may say, like Erasto in *Les Fûcheux*,

Un duel met les gens en mauvaise posture;

but he should have thought of that before he provoked a Frenchman. He may also observe with Fabien in the *Corsican Brothers*, that "he who employs his mastery of a weapon to kill an opponent less expert is a murderer." But that is M. Laisant's affair. When Sir Walter Scott expected a challenge from one of Napoleon's generals, he said, "Jacky, I will not balk him," and the Sheriff, though a man of law, would have gone out with the best grace in the world. But now it comes to blades or bullets, Mr. Bradlaugh retires on his position as an Englishman. If we do not misinterpret his letter, he is not disinclined to meet M. Laisant personally where there are no seconds and no weapons but those which nature has given us. But M. Laisant is no adept in *le box e*, and, if he were, and even if he drubbed Mr. Bradlaugh, that would not be

the satisfaction for which his chivalrous and democratic soul is craving. There is a story in a little history of duelling by "Sir Lucius O'Trigger" (Newman and Co.) of an Englishman who drew a pistol when his French antagonist drew his sword. The pistol, he said, was the English weapon. "It is the custom of Englishmen to fight with pistols. Now I can see no more reason why I should take up the customs of your country, and quit that of mine, than why you should forsake yours and adopt ours." Mr. Bradlaugh quitted, we think, the customs of our country when he applied such strong language to the conduct of M. Laisant. He should have foreseen that he would not be allowed to return to the manners of England without expostulation. He is in a much worse position than the Englishman of the story, because we have ceased to use the pistol, except occasionally in affairs with burglars and Irish rapparees, and then not by way of duel. Perhaps the fair thing would be for Mr. Bradlaugh with his fists, the national weapons, to meet M. Laisant with his duelling sword. As we do not wish to see either country deprived of its most advanced politician, we would suggest a modification. Let M. Laisant with a foil tackle Mr. Bradlaugh with the gloves. This, we believe, would be quite a new kind of combat, and it could not but afford entertainment to amateurs, while both parties would leave the assault without a stain upon their honour. Mr. Bradlaugh's own idea was to submit the matter to arbitration, as in the case of the *Alabama*. But would he be prepared to accept anything analogous to the Geneva award; for example, to pay many thousands of francs as recompense for the wounded feelings of the injured M. Laisant? Or was the "Jury of Honour" merely to say which side has behaved least honourably? But as M. Laisant has declined the jury in a somewhat strongly-worded epistle, it is needless to consider its possible duties. Mr. Bradlaugh must digest as he pleases the words "farceur," "il ment," and "mépris public," which this letter contains.

The recent statistics of duelling in France seem to show that the sport is more dangerous than we usually suppose. Mark Twain thinks that the risk of catching cold is the greatest incurred by the combatants. But in twenty-two affairs three men were killed, and a very fair proportion wounded. In a duel with pistols both men may miss, and the seconds may separate the principals; but when swords are the weapons, it is scarcely possible to part without at least a scratch. The duellists of the past were more determined than our modern journalists and politicians. When De Botteville fought De Beuvron, in the reign of Louis XIII., the seconds took part on both sides; and this seems to have been the case in Molière's time, for Ernste speaks of *le refus de mon bras* when he declines to act as the second of Alcandre, in *Les Fâcheux*. In the earlier part of the seventeenth century fighting seems to have been a very rough affair. De Botteville and De Beuvron, already referred to, fought with sword and dagger. At the first encounter they missed each other, and "came," says "Sir Lucius O'Trigger," "to a mutual grappling by the collar. They threw their swords on the ground, and held their poniards levelled at each other, but without striking." It was as in the celebrated case "when the townsmen finked the gownsmen, and the gownsmen finked the town." They were reconciled on the spot. A much more desperate encounter was that between Lord Bruce and Sir Edward Sackville. The latter wrote a long account of the affair to a friend in England. The pair met in Fergoso, in Zealand, and proceeded, with seconds and a surgeon, to the frontier, near Bergen-op-Zoom. When Sackville's second arranged with Lord Bruce about swords, Lord Bruce said that "a little of Sir Edward's blood would not serve his turn, therefore he was now resolved to have him alone," where no one could stop the combat. The duellists rode off together, and alighted in a meadow, "a mile-deep in water, at the least, and, bidding farewell to our doublets, in our shirts began to charge each other, having before commanded our surgeons to withdraw themselves at a pretty distance from us." Sackville made a thrust, but was sharp, and received a wound in his arm, before he could recover himself. Pressing on more eagerly, he missed, and was wounded in the right breast, the rapier passing almost clean through his body. Next, he lost a finger, and by this time the pair were grappling, in a style now happily disused. While still grasping his opponent's sword, Sackville freed his own, and offered Lord Bruce his life. The latter would not yield, and Sackville, thrusting blindly, like Roderick Dhu, missed Lord Bruce's heart, but wounded him twice desperately in the body. Bruce fell, with Sackville above him, but, far from asking his life, declared he scorned it; "which answer of his was so noble and worthy, as I protest I could not find in my heart to offer him any more violence, only keeping him down, until at length his surgeon afar off cried out he would immediately die if his wounds were not stopped." In the end, Bruce's surgeon tried to stab Sackville, but was prevented by that gentleman's medical attendant. When Dr. Bennett met Dr. Williams on a professional quarrel, the battle was not less resolute. Pistols as well as swords were used. Dr. Bennett was hit with a bullet, and tried to draw his sword, when Dr. Williams ran him through the body. The pious Bennett, "praying to God to invigorate him," dragged out his rapier, and ran it through Williams's breast bone. Both were dead within four hours. About these affairs, and the fight between the Duke of Hamilton and Lord Mohun, "Sir Lucius O'Trigger" observes:—"How these gentlemen were able to continue these fights at all after receiving such mortal wounds is marvellous. . . . It is declared by eye-witnesses that they seldom parried, but continued to cut and thrust at each other." They had

more pluck than science. With honour calling him on, with such heroic examples inviting him, can Mr. Bradlaugh decline the combat? Even if he falls, though the House of Commons will miss him, and Northampton deplore him, the great mundane movement will go on as before. There will be but another addition to the gallant band who have died on the field of honour.

FIXITY OF TENURE.

ALTHOUGH the statement that the Irish Land Commission of five members has by four to one decided to recommend the first F—fixity of tenure—may very likely be nothing but a bold guess, there is also sufficient possibility of its truth. This being the case, it is worth while perhaps to consider what fixity of tenure really means. There is no greater danger in political matters than the readiness with which certain phrases get caught up and repeated, until they lose in the mouths of most of those who repeat them any connexion whatever with a clearly formed notion of their meaning. All the three F's have of late come under this class of political Abracadabras. The moderate Irish party has shouted them against the extreme Parnellites, the English supporters of the Government (especially Mr. Gladstone's fount of wisdom, the provincial press) have caught up the shout as against English Tories and Whigs, and the consequence is that the panaceas recommended by hundreds of persons are accepted by thousands more who have no idea whatever what its final acceptance and embodiment in legislation would imply. Fixity of tenure comes first in the triad; it is most germane to the popular idea that the chief delight and favourite amusement of the Irish landlord is an eviction, and it is at any rate supposed, as we have seen, to stand the first chance of some more or less qualified adoption to be evolved, by one of the familiar processes of Mr. Gladstone's legerdemain, out of the proposed extension and correction of the Act of ten years ago. Let us take fixity of tenure then, and look at it.

According to the widest and simplest meaning of the term, the establishment of fixity of tenure would transform the tenant of every Irish farm, whether of five acres or five thousand, into a life-owner, with remainder to his descendants, and some power of otherwise transferring his interest, subject only to the payment of rent to the landlord, who would then cease to be in any sense a landlord, and would become a kind of mortgagee, without the power of foreclosing. There are, we presume, very few persons of education and intelligence in England who would not be a little startled at this as it stands. Let us make the immense concession, for the sake of argument, that the actual sacrifice of the difference in value between the fee-simple of the land and of the rent-charge on it is a sacrifice which it is fairly within the power of Parliament to require of the owner. Innumerable obstacles to the carrying out of any such plan suggest themselves notwithstanding. Although too many Irish landlords spend but little on their land, it is certain that a very large number make annual investments in improvements more or less permanent, which are quite equal to any English landlord's usual expenditure for the same purpose. Even Mr. Bright, we presume, would hesitate to say that a farm on which the tenant has spent little or nothing, and on which the owner has spent a thousand or five thousand pounds, should be handed over, with the capital sunk in it, as a free gift to the lucky occupier and his heirs for ever, subject only to the payment of rent. Again, existing leases present an almost insuperable difficulty. But, supposing all these things got over by a huge court of arbitration and a great compensation fund, provided somehow or other, the difficulties of the situation would only be begun. Fixity of tenure by itself would in the majority of cases be a very doubtful blessing to the occupant, if his own statements are to be believed. His rent, he says, is too high already, and the answer is to saddle him and his with the payment of that rent in *secula seculorum*. In other words, the first F implies the second and cannot exist without it. But even if we lay this aside we are not at the end of the difficulties. It is generally acknowledged that the only excuse for the high-handed measures called Land Acts is to be found in the prospect of great national benefit; if the position of the tenant generally is not likely to be improved by them, they are inexcusable. Now fixity of tenure in the simple sense is not only not likely to improve this position, but is likely to make it very much worse. The English advocates of the three F's very likely have never heard what has come of the 999 years middlemen's leases, once so common in Ireland. Those who have heard of it know that these things, which came as near to simple fixity of tenure as anything can well do, were the cause of most of the worst cases of Irish misery and destitution. Endless subletting and subdivision; profit rents of the most exorbitant kind; no improvement, no thrift, no self-reliance, came of them; and the same would assuredly come of simple fixity of tenure unguarded by covenants as to subletting and subdividing. Besides, in a very large number of cases the actual holder has sufficiently proved himself to be the very worst man for the position. Fixity of tenure determines that he shall continue though there may be fifty better men waiting to replace him. In short, fixity of tenure, pure and simple, is not only sham and a delusion, because it needs the other two F's to make it possible at all even in theory, but is certain to be unworkable and disastrous in practice.

Probably most reasonable people will admit this, and will disavow any intention of any such simple system of *novæ tabulæ*. But

a modified system of fixity of tenure, adjusted to individual requirements, and made workable, is exactly one of those things which can very well come about by the free operation of contract, and which can by no possibility be brought about by a sweeping and arbitrary compulsion. The fixed-tenant of course suggests the English copyholder and the Scotch feuar. The resemblance, however, is perhaps more deceptive than helpful. As to the copyholder, the inconvenience of his tenure has been sufficiently felt already to make it very nearly a thing of the past. As for the Scotch perpetual feu, it is not only a matter of perfectly free arrangement between superior and vassal, but there are numerous causes of what is technically called "irritancy"—that is to say, voiding of the feu charter and return of the land to its owner. One of these, it is not irrelevant to mention, is the non-payment of the feu duty for two years. Another, not, we believe, universal, though usual enough, is the transference of the feu to third persons without the granting of a new charter and the payment of a fine. Now, the average Irish tenant is exceedingly fond of transferring his right, and by no means unaccustomed to remain more than two years in arrear. Only the thorough-going believers in the "magic of property," and what we have called the Abracadabra of fixity, will believe that these little peculiarities will at once disappear. Besides, is it to be supposed for a moment that a qualified fixity depending on punctual payment of rent, excluding subdivision and subletting, precluding deterioration of the property, &c., would be grateful to any Irish tenants who are unwilling to make the arrangements by which they might in most cases at the present time obtain advantages equal or superior? Clearly such a supposition is idle. England and Scotland will give us no help in the matter. The custom of the manor and the will of the lord, which determine the status of the copyholder, will find no counterparts in the new order of things advocated by Mr. Shaw and his friends. The plain, business-like nature of the transaction which cloaks itself in the quaint medieval terms of Scotch law, is equally repugnant to the spirit of a claim which, put into plain language, is simply a claim on the part of the tenant to a slice of his landlord's property at once, and a right to make ducks and drakes of much of the rest at his good pleasure. The Irish fixed-tenant must be a creature *per se*—a thing remote alike from copyholder, feuar, and lessee. His would-be creators know this well enough, and this is why they are so earnest with us to look at Irish matters with Irish eyes, and to discard all prejudices arising from English and Scotch ideas.

Let us, then, look at fixity of tenure with Irish eyes. We have already intimated the nature of the spectacle with which those eyes, if they confine themselves to history and not to fiction, furnish us. Wherever the Irish landlord has surrendered his land to tenants at a fixed rent, either in perpetuity or for those long terms which are in all but legal technicalities equal to perpetuity, the result has been, if not universally the same, the same in all but very few cases. More than one town in the South-West bears witness to the results of the proceeding in towns; scores and hundreds of estates in the same region show what the result is in rural districts. A public-spirited landlord lets in perpetuity or on long leases considerable plots of land to tenants on the sole condition that they build a good slated house on them. The town grows, and the lessees avail themselves of their roomy plots to crowd noisome alleys of tumbledown cottages together, from which they derive a handsome profit, which defies the superior's object, and over which he has no control whatever. Country tracts of some size are let in the same way, or cotters are established in perpetuity or for a long time in small holdings. The big lessee immediately starts middleman, sublets his holding at a profit rent, and does not greatly care if the sub-lessee repeats the proceeding. The small lessee subdivides in favour of his children or of strangers who can pay him until the plots become absolutely inadequate to the support of human beings even in the most favourable years. No reasonable person can produce the slightest reason capable of being accepted by any other reasonable person why the compulsory establishment of fixity of tenure by the law should have any other result than the voluntary establishment of fixity of tenure by scores of landlords has had. The rage of the Irish character for squeezing an income out of land somehow or other, in place of taking to other employment, its improvidence, its indolence, are all causes which will continue to work, let laws and lawmakers plot their cunningest. Indeed, the elimination of the one check which now exists—the refusal of landlords to permit these ruinous processes of subletting and subdivision—must necessarily make the matter far worse than it is at present. The check of eviction being gone, all is gone. So that, if we look on the matter with those Irish eyes which we are so earnestly entreated to borrow, the thing becomes worse than it was before. Of the minor difficulties of fixity of tenure; of the impossibility of devising any guarantee for the reception of his rent by the landlord short of allowing a right of re-entry which practically annuls the fixity; of the injustice of continuing to burden mere rent-chargers with the payment of the rates and taxes incident to landowners, and the certainty of discontent if the attempt were made to transfer these charges to the new tenants—of a hundred other such things there is no need to speak here. We have shown sufficiently that mere fixity of tenure, in any sense in which the word is not a mere sham, is impracticable, or at least illusory, in the first place, and would be socially ruinous in the second.

THE TRADE OF 1880.

THE Board of Trade Returns for December, which appeared at the end of last week, give us the result of the foreign commerce of the country for the whole year, as well as for its closing month. The information thus brought out is specially interesting because the revival of trade therein recorded came quite unexpectedly at the end of perhaps the worst harvest of the century. It may be worth while, then, to examine in a little detail what the returns have to tell us. And in the first place we find that both sides of the account show a marked increase for the year. The imports amounted to 409,990,056*l.*, being an increase of nearly 48 millions, or 13½ per cent. over those of 1879, and the exports of British and Irish produce and manufactures amounted to 220,810,526*l.*, being an increase over those of 1879 of more than 31½ millions, or 16½ per cent.

Confining ourselves for the moment to the exports, as it is by them that the goodness or badness of trade is popularly, though erroneously, judged, we find that the increase was not only larger than in the case of the imports for the whole year, but, what is more satisfactory, it was well maintained in the four closing months. It will be recollected that the revival began in September, 1879, and that the three following months showed large augmentations over those of the corresponding period of the preceding year. The four last months of 1880 again showed large augmentations over those of 1879, proving not only that the improvement in trade continued, but that it went on at an increasing ratio. Relatively the greatest increase was in iron and steel, amounting to 45½ per cent.; but absolutely the greatest increase was in cotton manufactures, amounting to over 10½ millions. There was also a very large increase, both absolutely and relatively, in machinery and millwork, in hardware, in coal, in woollen and worsted manufactures, and in linen and jute manufactures. The United States continued to be the largest customers for iron and steel. They took 2,278,916*l.*, against 873,320*l.* worth in 1879, of pig-iron; and they took of railroad iron of all sorts 1,526,092*l.*, against 241,607*l.* in 1879. Next to the United States, British North America, India, Australia, and the other British possessions were our best customers. On the other hand, more than half the increase in cotton goods was due to India. Of the total increase in cotton goods of 10,803,531*l.*, India alone took 5,622,082*l.*, or more than one-half. We have in these latter figures a striking illustration of the importance of India to the great staple industry of Lancashire. As long as India was a prey to famine the spindles and looms of Lancashire were half idle, and the operatives were out of work; but as soon as famine disappeared the demand for cotton goods sprang up again and activity and prosperity were restored to Lancashire, so that now Manchester is busier than it has been for many years past. The figures further illustrate the severity of the recent Indian famine. In the last quarter of 1879 the exports of cotton goods to India were enormous; but, as we see, they have been still more enormous in the year just ended. The explanation is that during the famine period the people were unable to buy clothing, but that since the return of comparative prosperity they have been renewing their wardrobes. No doubt, the large exports of cotton have helped to depress the silver market, and have prevented the full effect of the stoppage by Germany of the sales of silver; but the inconvenience thence arising is trifling in comparison with the great benefit that the vast population of India has received, without speaking of the profits derived by Lancashire. The other countries which have taken larger quantities of cotton goods are the United States, British North America, Brazil, Hong Kong, and the Philippine Islands. There have also been very largely augmented exports of coal, distributed pretty equally amongst almost all our customers; and the purchases of machinery and millwork have likewise been very much larger, the best purchasers being Holland, France, Italy, Brazil, and British India.

Coming now to the imports, we find that, unlike the exports, they fell off to a marked degree in December, and as this occurred chiefly in the raw materials of manufacture, it might seem at first sight that a slackening in the growth of trade had begun; but this is not really so. As we stated above, the increase in the imports for the whole year amounted to 13½ per cent.; but the increase in the imports of the raw materials of manufacture alone amounted to as much as 22 per cent., even allowing for the falling off in December, or not far short of twice the rate of augmentation in the whole of the imports. The real explanation, it will then be seen, is that such large stocks had been laid in in the previous eleven months that some decrease was natural, and even necessary, in December. There was also in December a falling-off in the imports of food, chiefly wheat, as was to be expected from the better harvest last year. Classifying the various kinds of commodities imported, we find, as stated above, that the increase in raw materials was 22 per cent.; in articles of food, only 10½ per cent.; in what we may call luxuries—such as tea, coffee, sugar, wine, and tobacco—only 6½ per cent.; and in unenumerated articles, 13½ per cent. The very much larger proportional increase in the raw materials of manufacture comes out very clearly. The fact plainly demonstrates that trade continued improving to the end, and that manufacturers were thus encouraged to lay in exceptionally large stocks. It would seem, however, that in some instances they went too far, as there are complaints in the wood trade that the supply has become so excessive as ruinously to depress prices. Generally, however, the tone of the manufacturing centres is more sanguine now than

it was at any time last year, and a rise in prices is very generally looked for. The whole increase in the value of the imports of raw materials is 20½ millions, and of this total nearly 6½ millions is in raw cotton—another evidence of the great improvement in the cotton industry. The next largest increase is in timber, which somewhat exceeds 5½ millions. The next is wool, nearly 2,900,000l.; and the next, iron ore, 1½ million. Here, again, we have evidence of the great demand for iron, which not only stimulated the production at home, but also increased the import of foreign ores. It is to be borne in mind, however, that for certain kinds of manufacture these foreign ores are superior to our own; but they form only a small part of the whole iron consumption. In the food imports, wheat, eggs, fish, and pork alone show a falling-off. In all other articles there is an increase—a very large one in living animals, butter, cheese, and maize, and a considerable one in most other items.

Perhaps the most interesting part of the returns is that relative to the imports and exports of bullion. The imports of gold have fallen off to a very great degree in the last three years. They amounted in 1878 to as much as 20,872,216l.; in 1879 they were 13,331,369l.; and last year they were no more than 9,458,996l., or actually considerably less than half those of 1878. Of this total we received 3,614,200l. from Australia; 2,118,036l. from France; from Japan, 1,180,066l.; and from Mexico, South America, and the West Indies, 679,871l.; while from the United States—which used to send us from 8 to 9 millions annually—we got last year no more than 55,365l. On the other hand, the exports of gold amounted to 11,828,822l., or nearly 2½ millions more than the imports. And of this total as much as 5,511,887l. went to the United States; 1,076,380l. to Egypt; 1,090,532l. to Mexico, South America, and the West Indies; and 865,821l. to British India; while France received back only 602,218l. The exports last year, however, were considerably less than in the previous year, when they exceeded 17½ millions. And even in 1878 they were very nearly 15 millions. The imports of silver amounted to 6,828,968l., of which 2,382,492l. came from Mexico, South America, and the West Indies; 2,066,435l. from France; and 1,198,567l. from the United States; while only 407,393l. came from Germany, and 193,305l. from British India. The small import from the United States will be remarked. Only a very few years ago we were threatened with an import thence of 9 or 10 millions, when, as a matter of fact, we see that it now scarcely exceeds a million. No doubt, the coinage of silver dollars absorbs a large portion of the American production; but, after all, the total coinage is under 5 millions in the year, which, if the production of the Nevada mines was anything like what it was expected to be, would leave a large surplus for export to Europe. The export of silver amounted to 7,060,681l., or but very little more than the import. And of the total British India took 4,321,507l., China 1,125,562l., and the remainder went in small amounts to the various countries of the world. The export to India was 1½ million less than in the previous year, and very much smaller than some years ago; but the large drawings by the India Council, of course, supply means of remittance which largely account for the falling off; and the great increase in the exports of cotton goods, to which we refer above, would naturally also decrease the export of silver. However, this decrease in the absorbing power of India is having a marked effect upon the price of silver, which has been falling for some time, and seems likely to go lower; indeed, the accumulation of the silver dollars in the Treasury vaults of the United States and the decrease in the exports to India, it is feared, will together bring about a crisis before very long. We are inclined to think that the apprehensions on this head are exaggerated, as by and by no doubt the exports to India will begin again on a larger scale; but there is little doubt, at the same time, that if Italy does not resume payment in silver, the market for that metal must be depressed.

Coming in the last place to the tonnage of the ships entered and cleared with cargoes during the year, we find an increase in the entries of the shipping engaged in the foreign trade of 13½ per cent.; in those cleared of 12½ per cent.; also an increase in the entries coastwise of 1½ per cent., and in the clearances coastwise of 2½ per cent., and it is worth adding that in the coasting trade the increase is larger in the last month than for the whole year. From the foregoing review we see that the year has been in every respect one of profitable and improving trade. We pointed out a couple of weeks ago what the character of that trade has been. The prices of commodities have declined from the high level they reached twelve months ago; but this decline helped to maintain and stimulate the revival which had then begun. The first effect of the American purchases of iron was to send prices up too high, and thus to endanger the permanence of the improvement. The fall of prices put an end to this danger, and allowed the improvement to go on and become strengthened. It has now become so extended that its permanence cannot any longer be doubted. The American imports of iron and steel have long fallen off; but the growth of trade has continued nevertheless, and nearly every country now shows larger purchases of some commodity or other. We remarked above on the very large increase in the exports of cotton goods to India, and although no other instance of the same magnitude can be cited, it would be easy to show, if it were not too wearisome, that there has been an increase in the trade of nearly every country. The present feeling through-

out the country is that the year upon which we have entered will be a still better one than that which has just ended; especially it is expected that the demand for iron will by and by become very great, and that prices will go up. Coal, too, which has been so long depressed, has improved, and, as we pointed out above, the exports to all countries have increased, not very much in any one direction, but very considerably in the aggregate. Apart from the demands from India, the state of the Manchester trade too is exceedingly good, and the intelligence from that city is to the effect that the mills have not been so well employed for several years past.

SOME RECENT MUSIC.

ELEVEN years after his death, Berlioz, who during his life could scarcely gain a hearing for his music, has scored a complete success in London, and *La Damnation de Faust* has attracted audiences whose enthusiasm almost verges upon extravagance. Last year Mr. Charles Hallé brought his admirable Manchester orchestra and choir to London for the purpose of introducing this work to the public, and so great was the success on that occasion that he determined to reproduce it this season. The band and singers, it is true, are not altogether the same as on the first production, but notwithstanding this the original intention of giving two performances of *La Damnation de Faust* has already been extended, and it may not perhaps be extravagant to hope for yet more performances. Save perhaps on the occasion of his death, through the obituary notices in the daily newspapers, the general public within the last year or two was ignorant of anything beyond the name of Berlioz, though his works were gradually exercising their power over the minds of not a few who have since achieved success in the musical world. His influence, whether for good or for bad, is already great, and credit must be given to Mr. Hallé for pointing out whence this influence proceeded. We do not intend to discuss the question whether what has for want of a better name been called "programme music" is desirable or not, nor need we now inquire whether Berlioz's methods are worthy of imitation or not; but we cannot help thinking that the stage might be a fitter place than the concert-room for the performance of such a work, as *La Damnation de Faust*. The Faust legend has for centuries been the almost exclusive property of the stage, and if ever there was an adaptation of it which required action to perfect it, this is surely the case with Berlioz's adaptation. It may be said, of course, that the composer never intended it for stage representation, and the objection has some force; but if some enterprising manager were to undertake its representation, we could scarcely hesitate to prophesy its success. So dramatic is the music that we felt that the one thing in which the performance suffered was the want of action that belongs of course to a concert-room. There are doubtless some situations which would be hard to overcome upon the stage, such as, for instance, "The ride to the abyss," but even this, one may imagine, would not be impossible. Of one thing, at any rate, we feel certain, and that is that dramatic action would greatly enhance the effect of the music. Berlioz's *Faust* differs in many ways from the versions which are already before the public, and in one particular at least it may seem for theatrical purposes to have gained in dramatic interest. The signing of the contract between Faust and Mephistopheles is deferred in this version until Faust learns that Marguerite is in prison on suspicion of causing the death of her mother, and the motive for his signing the dread document is that Mephistopheles promises her escape if he does so.

The work opens with a quiet pastoral *motif* indicative of the return of spring, which is followed by a piece of instrumental music, in which the chorus of peasants and the Hungarian march, which are to follow, are skilfully interwoven. The peasant chorus is one of those remarkable efforts of which Berlioz was master, and it seems to carry one along with a rush of joy, while the Hungarian march, which closes the prologue or first part, is a masterpiece of that form of musical writing. The second part shows us Faust in his study disgusted with life and seeking to free himself by poison, when, as in other versions, his hand is arrested by the sounds of the Easter Hymn without. The sudden appearance of Mephistopheles unbidden by Faust is, however, the cause of Faust's relinquishing the thought of suicide, and from this point the action follows more or less the lines of other versions of the legend. Brander's song in Altmayer's cellar in Leipzig, and the subsequent fugue on "Amen," are a strange mixture of humour and erudition, and Mephistopheles's "Once a king he it noted" is sufficiently comic. In the third scene of this part Mephistopheles has a fine air, "Maid banks of roses," which is followed by a remarkable chorus of sylphs and gnomes intended to lull Faust to sleep, which was very gracefully rendered, and to this succeeds one of the gems of the whole work—namely, the "Ballet of Sylphs." For fairy gracefulness this piece of music is almost unrivalled, and the orchestra did much justice to its beauty. Faust on waking cries for Margaret, whom he has seen in his dream, and Mephistopheles, after a prologue to show her to him, urges him to mingle with the crowd. On this follows a chorus of soldiers and students, which brings the second part to a close. In the third part Margaret appears for the first time. The ballad of the King of Thule in the first scene is extremely tender and quaint, and the composer has caught the spirit of the words in a manner most remarkable, while the sigh which ends

the song is almost indescribable in its effect. An incantation by Mephistopheles follows, to which is added a fantastic "Dance of Will-o-the-Wisps" the prelude of which introduces us to the "Serenade." This, the most remarkable number of the whole work, and which has been indicated more than once before, is, for diabolical humour, at once one of the strangest and most fascinating products of Berlioz's genius. Written in *tempo di valse*, it is accompanied by a guitar-like movement, and the disregard of conventional closes makes it sufficiently grotesque. The shriek of the demon chorus at the end of each stanza has in it something appalling. With the exception of the "Chorus of Infernal Spirits," a piece of strange eccentricity, perhaps even Berlioz has never written anything so completely diabolical. The rest of the work resembles to a great extent, as far as plot goes, the other versions, and thus gives occasion to a beautiful duet between the lovers, and the song known in the German as "Meine Ruh' ist hin," for Margaret, until we reach the part where Faust signs the "musty deed" which gives Mephistopheles the absolute power over his soul. "The Ride to the Abyss," a singularly impressive and dramatic piece of music, ensues, and ends with the destruction of Faust and the joy of the Infernal Spirits. As a specimen of Berlioz's eccentricity, we give the words of the Infernal Chorus, leaving the reader to make what he likes out of it:—

Has, Irimiru Karabras?
Tradition murexill traduxa burrudixe
For my dinkorlitz O mari Katu omeytax
Uraaike
Muraaike
Diff, Diff, mcrondor mit ays'lo
Has, has Satan, Belphegor, Mephiste.
Has, has, Koix, Astaroth, Belzebuth,
Sat rayk Irimour.

To the performance of the work much praise must be given. Miss Davies sang Margaret's part with considerable success, and Messrs. Lloyd and Pyatt sustained the respective parts of Faust and Brander very creditably, while Mr. Santley's Mephistopheles—the only part really dramatically delivered—was a thoroughly admirable performance, tantalizing only by the absence of stage effect. To Mr. Hallé's indefatigable energy and skill in conducting is due the completeness of the success which the work has met with this season. We hope that he has been sufficiently encouraged in the production of this work of Berlioz to introduce to the London public *Enfance du Christ* by the same composer, which, we see, he has already given at Manchester.

The last Monday Popular Concert was chiefly remarkable for the reappearance in London of Mlle. Marie Krebs. The programme contained no novelties and was somewhat shorter than usual. Mme. Norman Neruda, Messrs. Strauss, Zerbini, and Piatti gave an admirable rendering of the quintet in G minor by Mozart, an old favourite at these concerts, and Mlle. Marie Krebs played the famous "Waldstein" sonata of Beethoven. This sonata, one of the most difficult of execution which Beethoven ever wrote, was evidently intended by him as a test for the powers of the pianoforte player; yet while it is replete with difficulties only within the range of the most expert performer, he has succeeded in retaining a world of poetry and imagination. The gymnastics he allots to his performers do not rob his work of true music. Mlle. Krebs's rendering of the favourite sonata was admirable, and we are glad to welcome such an artist as she is to London again. Beethoven's Serenade Trio was the only other instrumental piece. The vocalist on this occasion was Miss Hope Glenn, and the really fine manner in which Miss Glenn sang Haydn's "Il pensier sta negli oggetti" deserved, in our opinion, more recognition than it received. To a fine rich voice she has added careful study, and, from what we have heard of her singing, we should say that she has a future before her.

DUTCH MASTERS AT BURLINGTON HOUSE.

THE magnificent series of Dutch masters from the Hope collection gives, as we have already observed, exceptional importance to the present display at Burlington House. With a hearty recognition of what is offered to us in the work of other schools, it is, nevertheless, to the art of Holland, as it is displayed in the Second Gallery, that we find ourselves constantly returning with an ever-increasing sense of its extraordinary value and interest. Nearly all the eminent Dutchmen are here, nor, amid the large gathering of their works, is there often occasion to question the authority of the catalogue. The examples in nearly every case are of convincing genuineness and of superb quality, and in some instances we have an opportunity of studying the art of men who are comparatively little known in this country, or known at best by work that imperfectly represents their powers. The large composition by Van der Helst (87), apart from its high historical interest, is in this way a revelation of the painter's remarkable gifts. Nor are there many collections in Europe which could boast of three such examples of Paul Potter as are here exhibited. But if the loan from Deepdene is rendered exceptionally attractive by the specimens which it comprises of men whose works are rare and unfamiliar, it is even more remarkable for the fulness with which it illustrates the genius of painters whose place is universally recognized and whose style is widely known. Terburg, Jan Steen, Metz, and De Hooche have never certainly been seen

to greater advantage. The portrait of a Burgomaster (80), by the first-named painter, comes from the San Donato collection. It has been sent to Burlington House by Sir William Abdy, who contributes several interesting examples of early Italian art which we shall have occasion to notice in their order. This specimen of Terburg's powers in portraiture is of admirable quality, although it appears to have suffered somewhat in colour; but, good as it is, it will not stand comparison with the exquisitely finished composition of "Soldiers Drinking" (110), which forms one of the gems of the Hope collection. Here we see the full measure of Terburg's powers as a colourist; and we have to acknowledge that, with the exception of De Hooche, he was in this respect without a rival among the genre painters of Holland. It is not merely that he has a fine sense of colour, and that he can select and combine the most delicate tints, but that he is able to preserve the harmony he has invented without the surrender in any part of his work of the imitative truth proper to the representation of each separate object in the scene. The steel armour worn by the principal figure gleams with a brilliance and reality that approach almost to illusion; and the silk scarf around the soldier's waist, his heavy leather boots, and his embroidered sleeve are all executed in a style of the highest technical finish, which, at the same time, takes due account of every variety of texture and material. And yet with this extraordinary minuteness of detail there is associated a breadth of style and a perception of the refinements of character and movement which assert the presence of the artist no less than of the accomplished craftsman. It is interesting to note how in another Terburg, from the same collection, this costume, with its breastplate and back piece, is faithfully repeated (108), but under such different conditions of light and tone as to yield in the result an entirely distinct artistic effect. These are the two finest specimens of the master in the exhibition. A third example, also from Deepdene (116), and treating of the hackneyed theme of a Music Lesson, is of far inferior quality, though here, as in the other two, it is worthy of remark with what skill and understanding the painter interprets the character of the dog as forming part of the domestic life of the time. In every one of the three groups a dog is introduced, and in all the bearing of the animal is shown with the keenest observation of nature.

The several paintings by Metz are not of uniform excellence. There is one of a Lady Reading a Letter (125) wherein his peculiar gifts are expressed in absolute perfection. No painter of the school possessed in equal measure the power of giving a sense of dignity and even of beauty to the forms of simple people. He could treat the costume of his time in such a way as to let the action of the figure have the freest expression. There is sometimes a suggestion of almost classic grace in the bearing of these cumbersome Dutchwomen, and we know of no instance where he has employed his art with happier effect than in the figure of the waiting-woman in the picture before us, as she stands with the pail under her arm, and a letter lightly held between her fingers, while with her right hand she draws aside the curtain that covers a picture upon the wall. This delightful little composition is further interesting as showing the extraordinary subtlety with which the best of these Dutchmen interpreted the social life of their century. The grouping of these two women, the one intent upon her letter, the other lingering in the room in the presence of her mistress, has an air of unconsciousness which is truly wonderful. There is no deliberate attempt to invent a subject or to depict a striking scene. The actors in this uneventful little drama have evidently been unaware of the artist's presence, and yet this chance glimpse at the ways of their daily life tells us more, and tells it more simply, than a hundred pictures with a portentous moral and a liberal display of cheap domestic pathos. The smaller painting of a Gentleman Writing (127) is an admirable piece of technical work, but it has not the same intellectual charm, while the two remaining Metz from the Hope collection are markedly inferior in every respect. Indeed, it is difficult to believe that the dark and poorly coloured composition of a Lady Writing (130) can be an authentic example of the master. We have just spoken of the absence in most of the Dutch painters of any deliberate dramatic motive in their work. There is a notable exception to the rule in Jan Steen, who is also splendidly represented on the present occasion. But what is gained in his case by the admixture of a spirit of conscious comedy will not, to our thinking, atone for the inferior perception which he displays of qualities of a purely artistic order. His technical powers at their best are not to be surpassed, and they could not be better illustrated than in "The Christening" (100), or the still finer interior (104), wherein a lady offers a glass of wine to her guest, while an old woman in the background is employed in opening oysters. In both there is an extraordinary variety and vivacity of expression, combined with the most careful elaboration of every detail. But, in spite of the fullness of incident with which he enriches the canvas, it is impossible not to miss those finer truths of form and character which reveal themselves, as if by some sort of magic, in the quiet gaze of men like Metz and Van der Meer of Delft. Of the last-named painter there is only a single example (93); and, although not of the first merit in regard to colour, it forms a valuable contribution to our knowledge of a very great and a very rare master. Three very beautiful works by De Hooche, one lent by Her Majesty (113), the other by Lord Strafford (101), and the third from the inexhaustible treasures at Deepdene (126), would alone

suffice to give exceptional interest to this section of the exhibition. Light and colour in their infinite combinations of glowing tone were the facts that exercised a permanent charm over De Hooghe's imagination. He is never weary of these warmly-lit interiors, in which figures and furniture alike are only so many instruments by which he registers the most delicate gradations of tint and tone, and by his own constant delight in his subject, and by the endless variations to which he submits a single motive, he contrives to convince us also of its inexhaustible interest and beauty. The picture from Buckingham Palace is in some ways the most remarkable of the three, although it has apparently suffered some damage in one of the faces; but the last of the series, with the scarlet skirt of the seated figure glowing in the diffused sunlight that fills the room, offers perhaps the highest expression of his force as a colourist. We must not take leave of the genre-painters of Holland assembled in these galleries without drawing attention to a *Toniers* of superb quality (96) lent by Lord Cowper, and to the highly-wrought examples of Gerard Dow (97) and Franz van Mieris (121).

Rembrandt, the incomparable genius of the Dutch school, whose powerful individuality rejects any attempt at classification, is not altogether well represented in the exhibition. The portraits of a Lady and Gentleman (75) is an interesting work of his early time, but it affords small indication of the ultimate direction of his art. The half-length male figure in the adjoining room (161) bears date eleven years later, and in certain respects it ranks as a very noble and characteristic work of the master. Its effect is greatly injured, however, from the fact that the right eye has been at some time injured, and has since been repainted in the most bungling fashion imaginable. We presume there is good reason for attributing to Rembrandt the large equestrian portrait of Marshal Turenne (165), though it does not bear the evidence of the master on its face; but there can, we fancy, be no sufficient authority for accepting as genuine the Christ and His Disciples in a Storm (168), a work in every respect unworthy of Rembrandt's genius.

THE THEATRES.

THE managers of the St. James's Theatre have done a bold thing. In a spirit of what may almost be called reckless adventure, they have produced a new play by a native writer, and, strange to say, their rash experiment is likely to prove eminently successful. This is for several reasons matter of congratulation. To those who have recognized at its due worth the artistic spirit which has always characterized the management of Messrs. Hare and Kendal their success will seem amply deserved. They have persisted, in spite of considerable discouragement, in maintaining a high standard of excellence in the representations at the St. James's Theatre, and in seeking to win the approval of the public they have ever been mindful of the claims of their own art. The continued prosperity of such a management is therefore a subject of concern to all who care for the progress of the drama in England. But, apart from such considerations as these, it is gratifying now and then to get out of the region of revivals and adaptations. There has been a little too much caution of late in the conduct of houses specially devoted to comedy. The growing esteem in which the actor's calling is held amongst us, and the increasing attention devoted to the theatre, have combined to breed a spirit of prudence and timidity that must be reckoned inconsistent with the practice of any of the arts. It is impossible to deal with the things of the intellect in the manner that befits the conduct of a counting-house. The drama, although it may often prove a source of profit, is not an investment that can ever be ranked with Consols; and it is idle to suppose that any amount of ingenuity will free its professors from the anxieties of a speculative career. And yet we fancy that a good deal of the present fondness for adaptations may be traced to an exaggerated feeling on the part of managers against any sort of risk or uncertainty. They are willing to pay liberally, sometimes even exorbitantly, for the fruits of a Parisian manager's judgment; and should the bargain prove disastrous, they have at least an intelligible line of defence. But to risk their reputation by pledging themselves to the production of an English piece is a very much graver matter. A failure here is held to reflect upon the soundness of their tastes; it shakes the confidence of the public in their infallibility; and it leaves all concerned without any kind of plausible excuse.

The production of *The Money Spinner* marks an agreeable departure from this attitude of caution. Mr. Pinero, the author of the new piece, is a clever actor who has already shown some aptitude in dramatic composition. He has written one or two comediettas which have been decidedly successful; but it was not conclusively shown in these earlier experiments that he possessed the literary force needed for the development of a more serious dramatic motive. It is true that the principal characters in *The Money Spinner* bear to one another a kind of relationship which has been made familiar to us in the work of an earlier writer. The old reprobate with his two daughters—the one so astonishingly refined, the other so naturally vulgar—cannot but recall the central group in Mr. Robertson's play of *Caste*. It is to a certain extent the Eccles family over again, and in the place of the aristocratic D'Alroy we have a clerk in a large house of business at Rouen. But while we easily identify our old friends under their new

names, we do not feel that the recognition implies any grave reproach upon Mr. Pinero's talent as an author. He has employed his material with skill and originality. The plot of his play is new, and it has besides a kind of strength that is unknown in the Robertsonian drama. The action as it progresses calls out certain qualities of individual character for which Mr. Pinero has to trust altogether to his own invention, and the result therefore ranks rather as a separate development of a motive common to the work of both writers than as an appropriation of another man's labour. The chief merit, indeed, of Mr. Pinero's play lies in the harmony which he always preserves between the dialogue and the action. He shows a rare tact in bestowing upon each incident the right measure of spoken words. What the actors have to say is never allowed to interfere with what they have to do, and this sense of balance between pantomime and dialogue is perhaps the surest test of a writer's true instinct for dramatic composition. It is allowable perhaps to complain that the characters which he has taken such pains to exhibit effectively do not for themselves claim our warmest sympathy. But it is very easy to push this kind of criticism too far. When it is suggested, as it has been in the present case, that the only person worthy of respect is the detective, who in the course of duty has betrayed his friend, the theory surely reduces itself to an absurdity. In the drama, as in real life, the interest of the looker-on is awakened much less by moral rectitude than by mental suffering. We feel most for those whose feelings are most deeply stirred, nor does it follow that because our interest is strongly aroused that we are therefore betrayed into any unworthy sympathy with wrongdoing. But, even if it were true that the characters in *The Money Spinner* are lacking in good qualities, the fact would only give additional emphasis to the skill with which Mr. Pinero has contrived his play. The two chief sinners in the piece are the fraudulent clerk and his wife, and if we were left without any explanation of their doings, the picture would certainly be neither attractive nor edifying. The woman who cheats at cards in order to save her husband, who has swindled his employers, might of course be no more than an ordinary representative of the criminal classes. But here there are special circumstances which serve to place her in a different category. She is the daughter of a brandy-drinking old card-sharp who has kept a gambling-hell in Paris, and yet she has not amid all her youthful temptations once yielded to the practices in which her gifted parent is an adept. It is only when he, her husband, is on the verge of ruin, and when she has pledged herself to repay the money he has taken, that she finds the old scoundrel's encouragement too strong to resist. This part is played by Mrs. Kendal with great power and great refinement. By a mode of interpretation that is always vivid and yet never unrestrained, she lets us see the full measure of the mental struggle that is going on before she can bring herself to execute her desperate resolve. And, when all is over, her absolute self-abasement and shame are rendered in such a manner as to anticipate and disarm the hostile feeling which her crime might otherwise awaken. Mr. Kendal, who plays the part of her victim, has a task which does not so entirely fit with his powers. To render the marriage with the vulgar little daughter at all probable there is need of a stronger accent of eccentric stupidity than he is able to command. It is a part suited rather to a "character-actor" than to a *jeune premier*, and the very qualities which serve him well in the ordinary creatures of light comedy are, in some sense, a hindrance to the success of the performance. Apart from Mrs. Kendal the burden of the piece falls chiefly on the shoulders of Mr. Mackintosh and Mr. Hare. The author has provided a new and very careful study of the figure of the detective, and the actor, seizing the idea with intelligence, completes the original conception with the happiest touches of art. As for Mr. Hare, it was clear from the moment of his first entry on the stage that he had a part in which he could exercise some of his most characteristic gifts. He evidently enjoyed, and contrived to make the audience enjoy, every carefully elaborated detail of the representation. The type is familiar enough, and it is for this reason the greater achievement to be able to transform the type into an individual portrait. The old scoundrel takes his place from the first as a new creation; and the odd mixture of dignity and meanness, of an exaggerated ease of manner, combined with a grotesque and unconscious vulgarity, are made admirably suggestive of the man's varied antecedents and surroundings. The piece is now preceded by *The Wolf in Sheep's Clothing*, in which Mrs. Kendal appears for the first time before a London audience. The part, however, makes no very severe demand upon her resources, or perhaps it would be more just to say that it exhibits her art in a form in which it had already achieved success. The telling alternations between an assumed gaiety and anxious suffering are very effectively rendered, but they do not greatly differ in kind from the rapid changes of mood which she had to pourtray in *The Ladies' Battle*. On the first night of the production of Mr. Pinero's new play *The Wolf in Sheep's Clothing* stood as the last item on the bill, and to some extent it suffered from the fact that the curiosity and attention of the audience had been already bestowed. The reversal of the order in which the two dramas are taken is certainly judicious, and by the omission of *Old Cronies* the evening's entertainment is now brought within reasonable limits.

The praise which we have been able to give to the English actors at the St. James's Theatre would certainly shock the sensibilities of a writer who has been discoursing on the English stage in the current number of *Scribner's Magazine*. The impres-

sions of a foreigner are always interesting, and here they are evidently founded upon some considerable acquaintance with the facts. This in itself is a substantial advantage, although it of course deprives the critic of that airy lightness of touch which belongs to the Frenchman with only a day to spare who believes that it is as easy to describe the condition of the English stage as it is to fathom the secrets of the universe. And yet, with all his faults, the Frenchman native-born is almost more charitable to us in our unregenerate state than the critic who has only borrowed the accent of French taste. No Parisian is so contemptuous towards English acting as the Englishman or the American who has worshipped at the Comedie Française. It seems from the article under notice that French taste does not permit any show of affection on the stage; and, as a matter of course, it is equally obnoxious to the writer. In common with an English critic who has lately favoured us with his views, the author of the paper in *Scribner's* was shocked by Miss Terry's bearing towards Bassanio. It is "too free and familiar" for Portia—who, we are told, was a "great lady"; and great ladies behave with decorum. This is of course only a single specimen of the kind of criticism which is here offered for our consideration, and many other curious specimens might be quoted, although they would not represent the best that the writer has to tell us about the English stage. But throughout the article there is an undertone of contemptuous indulgence towards our efforts in the art of acting which is highly characteristic of a certain school of modern critics.

REVIEWS.

LEADER'S MARY, QUEEN OF SCOTS.*

MR. LEADER has taken up a part of this noted woman's story that has been hitherto comparatively neglected. The greater number of the numerous writers who have taken Mary Stuart for their text have treated her rather as a bone of contention than as a study of biography. Hence it comes that certain brief snatches of her life have been made the subject of countless volumes of special pleading by writers whose aim it has been to prove her either a sainted martyr or a fiend in human shape. The vindication or vilification of her character has become a party question between Roman Catholics and Protestants, and has been pursued in a truly sectarian spirit, her defenders and accusers in turn attacking one another with all the fierceness and bitterness that usually characterize a religious controversy. Indeed, but for this religious element the subject must have been dropped long ago, for if the veil of prejudice and sentiment which obscures the story of Mary Stuart's life be thrown aside, the disproportion between the vast amount of attention which she has attracted since her death and the very unimportant part which she played in the world's history during her life becomes apparent. She was Queen of a poor and insignificant kingdom that had no influence on the politics of Europe, and she could not even keep the government of that kingdom, small as it was, in her hands more than a few years. Even in the larger kingdom whose throne she shared for a brief space, she had none of the influence which, considering her nearness of kin to the Guises and the close alliance that had so long subsisted between France and Scotland, might have been naturally looked for. Fate had, indeed, marked her out as a stirrer-up of strife from her cradle to her grave, and that strife waxed louder and more violent after the grave was closed upon her. But she was more a passive pretext for, than an active agent in, a great deal of that strife. While still an unconscious babe she was made the excuse for the wasting of her country by its powerful Southern neighbour; but that was the natural result of the relative position of the two kingdoms at this juncture, for England was in strong hands and Scotland in weak ones, and under those circumstances an invasion on one pretext or another was sure to happen. Mary personally had nothing whatever to do with it, any more than she had any part in promoting the invasion of England by which Philip ostensibly purposed to avenge her death. In her life she really did nothing that should make her memory revered. Though all the sovereigns in Europe, including the Pope, professed to take a great interest in her, she had not influence enough over one of them to induce him to draw the sword in her defence. All the intriguing which occupied the latter half of her life, clever as it was, produced but insignificant local disturbances in the kingdom of which she and her partisans chose to consider her the lawful sovereign. Nor was there anything in her character to make up for this want of achievement, and to justify the place in the first ranks among the leading figures of the sixteenth century that posterity has assigned her. The facts that she was very beautiful, that she could write Latin letters, that she was three times married, that the last marriage was as imprudent a runaway match as any schoolgirl's heart could desire, that she died a violent death and did a great deal of fancy needlework, have surrounded her memory with a halo of romantic sentiment which her personal merits certainly did not deserve. Looked at impartially, what strikes one most about her is the pertinacity with which she contrived to turn all the things that should have been for her wealth into occasions of falling. She had great

natural powers of intellect, and yet could not manage her own affairs; great powers of fascination and discernment of character, yet used them only to attach to herself the most unworthy objects. No one had more sagacity and shrewdness in forecasting future events, yet she ruined her cause by repeated acts of headstrong folly. Not the least foolish of these was her voluntary surrender of herself into the hands of Elizabeth. Knowing her rival as thoroughly as she did, Mary must have foreseen that she would never willingly let her go, and that an appeal to the arbitration of the sovereign of England was the surest way to alienate the affections of the patriotic party among her own subjects. She must have known also that the disaffection of the Roman Catholics in England, which she did her best to foster, must lead to the complete seclusion of a rigorous captivity. Probably she did not foresee how long that captivity would last. It seems, indeed, incredible that one so fond of excitement and of movement and of active exercise as she was, could linger on through twenty years of monotony and isolation. That her captivity lasted so long was a wonderfully happy thing for Scotland, for it secured peace with England, and peace with England was the one condition essential to the prosperity of Scotland.

It is the story of a part of this long captivity that Mr. Leader has now written. He has confined his work to the years which Mary passed under the guardianship of Shrewsbury. He thus takes up his story after the Conference of York, the point at which Mary's captivity may be said to have begun, and ends it with the year when Sir Ralph Sadler was commissioned to relieve Shrewsbury of a charge of which he was long before that time heartily weary. Mr. Leader thus avoids those two great whirlpools of the Marian controversy—the first appearance of the Casket Letters and the discovery of the Babington plot. He is thus spared the necessity of committing himself to an opinion on either of these important points. But, though not joining the camp of either party in the Marian war, Mr. Leader evidently does not think that Mary wrote the Casket Letters; but he does think her guilty of plotting against Elizabeth—indeed, he considers the whole time of her stay in England as one continuous series of intrigues, in which plans for the dethronement of Elizabeth found a place side by side with schemes for her own liberation. Mr. Leader's book is in no sense a controversial work; he has merely undertaken to give a faithful record of Mary's life, and of everything connected with her safe-keeping during these tedious years. He has done his work thoroughly well, and has spared no pains in searching out and bringing forward every scrap of information that can elucidate his subject. Lodge, Labanoff, and other writers; collections of letters and State Papers; all the documents, published or unpublished, that contain any reference to Mary, her gaolers, or her accomplices, have all been put into requisition, and the whole arranged so as to form a continuous and interesting story. From this story every one interested in the captive Queen may learn how she was lodged, fed, and guarded; whom she wrote to, and who wrote to her; what wondrous needleworks she wrought, and upon whom she bestowed them; who succeeded and who failed in visiting her—in short, all she did and said and looked and thought, with as much minuteness of detail as if she were the heroine of the last new novel. The outline of the story is soon given. There are few events to tell. Nothing occurs to break the apparent monotony of the captive's life save the occasional removal from one house to another. From Tutbury, of which she complains the most, describing her rooms as two paltry holes, and the garden as a place only fit for pigs, she is taken to Wingfield, thence to Chatsworth, and then on to Sheffield, and her life in each house is very much the same life, except that every now and then there are suspicions of underhand practices, or discoveries of attempts to communicate with the world outside, or rumours of plans for a rescue organized by her friends without; and after every such discovery the confinement grows stricter, the guards are increased, and the watchfulness is redoubled. At one time there was such good reason to fear an attack on Tutbury that Mary was removed in great haste to Coventry, where she had to be lodged at an inn. The unseemliness of keeping her in such public quarters was a cause of great anxiety to Shrewsbury, who was well pleased to get safely within his own walls again. All through the dreary record one hardly knows which to pity most, the captive or her keeper. No doubt he at first felt proud of the trust committed to him as a signal proof of his sovereign's favour. And the man who could write as he did, that he considered himself more highly favoured than all his "ansyesters" because Elizabeth answered his anxious inquiries about her health by a scrap of a note in her own handwriting, must have had a very servile soul and hardly deserved anything better than such cheap rewards for his faithful service and endurance of manifold provocations. One of his greatest trials was that Elizabeth never would allow him money enough to meet the expenses which his charge entailed upon him. At first he was allowed 52*l.* a week, a sum which he complained was not enough to pay for the maintenance of the Queen of Scots and her following, and afterwards this allowance was cut down to 30*l.* Even parting with this paltry sum, inadequate as it was, tried Elizabeth's niggardly soul sorely. Then, too, she over and over again grew suspicious of Shrewsbury's loyalty, though she had no more faithful servant, and proposed to hand his prisoner over to the keeping of Huntingdon. Had Shrewsbury been a wise man he would have let her go, and been right glad to get rid of her. But he dreaded any change as implying distrust of his honour, and therefore did his utmost to retain this very burdensome inmate in his household. How irksome his task was to him

* *Mary, Queen of Scots, in Captivity.* By John Daniel Leader, F.S.A. Sheffield: Leader & Sons. 1880.

may be gathered from his letters. Now he describes how either she or his wife contrives to be always with "this queen" so as to keep her, if possible, from making mischief; in another letter he says he has had "more trouble than he ever had before in one day." Then we find frequent complaints from Mary of the way in which her health gave way from want of exercise; and Shrewsbury, who dare not trust her out of his sight, has to walk out with her himself, though he suffered from the gout. His mind, too, was constantly kept on the strain for the detection of "practices" either among the Queen's people or his own. Moreover, he found himself made the object of the most groundless calumnies. At one time his own chaplain went up to London to denounce him as being a "practiser" himself. Even his wife, possessed by jealousy, after having at first zealously assisted him in his charge, went off, leaving him to bear the burden of it alone. Only once was he allowed a holiday during the whole long fourteen years, and that was when he went to London to act as President of the Commission of Peers at Norfolk's trial. After the execution of the sentence, which he then pronounced, he was made Earl Marshal in Norfolk's stead, and this empty honour was the only reward he got to make up for the loss of money, the loss of health, of peace of mind, and of domestic happiness, all which he suffered in the discharge of the arduous duty which his Queen demanded at his hands.

Another grievance, of which, however, Shrewsbury's tenants had more reason to complain than Shrewsbury himself, was, that whenever this expensive guest was moved from one house to another, the country people had to bear the burden of the removal of her baggage, the furniture, and plenishing required to make her lodgings suitable to her quality. All the carts and packhorses that could be got hold of were put in requisition to carry her effects, a *cortège* at which the owners grumbled mightily. Of all the houses at which she was quartered in turn, Sheffield was found the most convenient and suitable, both on account of its size, its strength, and its position, and also because there was another house within the limits of the manor to which Mary could be easily moved for change of quarters without much trouble. It was at Sheffield, therefore, that she passed the greater part of the time that she was in Shrewsbury's keeping. As Mr. Leader points out, it is strange that while every scrap of tradition is eagerly caught at in connexion with all the houses Mary Stuart ever stayed in, and even with some in which she never stayed at all—such as Hardwick—and while every spot in which she is even reported to have spent a night is thought worthy of notice, Sheffield Castle, where she spent many more nights than its owner can have desired, has been comparatively dropped out of sight, and is seldom even named in connexion with her story. It is certainly rather hard that, while the possession of a set of bed-curtains, of a pair of fire-screens, or of any other relic of needlework made by the busy fingers of the Queen of Scots, is supposed to give to an otherwise obscure dwelling-place a certain prestige and flavour of antiquity, Sheffield, under whose shelter all these elaborate designs took shape from the fingers of this illustrious needlewoman, should be regarded as a wholly modern and vulgar place, fit only for the making of knives and money, and as such quite beneath the notice of the romancer and the historian. Now Mr. Leader knows all about Sheffield, and very properly wishes to see it reinstated in its proper place in romantic history. His account of the Castle, the Park, and the Manor House is at once clear, graphic, and picturesque. Attached to the Manor was a building called the Lodge, in which tradition places the lodging of the Scottish Queen. It had a flat lead roof, on which she used to take the air. The view she enjoyed there is thus described by Mr. Leader:—

On this elevation it is probable the Queen of Scots took the air, and enjoyed the prospect, over the vales of Don, Sheaf, and Porter. The view on a clear day is most extensive. Even the dirt of a manufacturing town fails wholly to destroy the charm of the landscape. The hills are the old hills of Hallamshire, as they rise above the valleys, where flow her five streams. In their former wildness they were grand; but even now, cultivated, fenced off, built upon, gashed by quarries, marred by mine heaps, blackened by chimneys, they retain much of their old charm, and tempt the men of Sheffield to emerge from their crowded town and breathe God's air.

Mr. Leader's book is embellished by photographs from portraits of the Earls of Norfolk and Shrewsbury, and of Shrewsbury's famous wife, Bess of Hardwick. The frontispiece is a full-length of Mary at the age of thirty-six from the famous Hardwick portrait. Certainly, it does not represent any surpassing beauty of feature, but then it must be borne in mind that it was painted after years of confinement and disappointment had injured her health, and must have told upon her looks. Mr. Leader's remarks touching the apparent contradictions in Mary's portraits are worth noting. After quoting from a letter of Mary to her uncle the Cardinal, commissioning him to have four portraits of herself made to give as presents, he says:—

Does not this passage throw some light on that curious subject, the portraiture of Mary Stuart? Likenesses bearing her name abound in the old houses of England, yet few of them can be proved genuine, and many are utterly irreconcilable with the idea that they represent the same face. This letter offers a solution of the puzzle. The portraits were ordered from France, probably copied hastily from some picture there, and were distributed rather as tokens of recognition, than with any idea of recalling the features of a familiar face. Some would go to persons who had never seen the Queen of Scots, and would be prized, not because they were likenesses, but because they were her gifts. Hence we find all those strange diver-

sities of feature and of complexion which have perplexed enquirers, and led some to ask whether the Queen of Scots were a chameleon in her frequent changes of appearance.

Mr. Leader's description of Buxton, or the "Baynes of Bush-stones," which was then just beginning to come into favour, and was repeatedly visited by Mary, and always with benefit to her health, is amusing as contrasted with the Buxton of to-day. But want of space will not permit us to touch on all the varied points of interest in this the last contribution to the Marian literature. Suffice it to say, that it is a thoroughly readable record of a period which has hitherto been a neglected chapter in Mary Stuart's life.

THE POLYNESIAN RACE.*

THE Americans have long felt the want of an aristocracy in the United States. It is reported that an Aryan Society is now to be founded as a kind of order of nobility. None but Aryans need apply. The ingenious Hebrew, the bold Ganowanian (as Mr. Lewis Morgan calls the Red Man), the industrious Ah Sin, and the prolific negro will all sink to the level of a proletariat. As to the Irish emigrants, we presume that undeniable Celts will be admitted to the Aryan Society, but persons of Silurian or Iberian descent will be sternly rejected. But the aristocratic Aryans of the States may not be aware that they will have to admit such "coloured people" as the Polynesians to their new society. If Mr. Fornander is right in the opinion expressed in his *Polynesian Race*, then most of the Polynesians "are descended from a people that was cognate to, but far older than, the Vedic family of the Arian (*sic*) race." This theory was advanced by Mr. Fornander in the first volume of his book, noticed in the *Saturday Review*, on February 9, 1878. Mr. Fornander has collected and studied with much industry the legends, beliefs, songs, and genealogies of the Hawaiians. His notion is that Aryans of an age much earlier than the composition of the Rig-Veda entered India; got mixed up with Dravidians, and thus acquired a dusky hue; became "moulded to the Cushito-Arabian civilization of that time" (what time?); left India for the Indian Archipelago; yielded more and more to Cushite ideas, whatever they may have been; and at last pushed into the Pacific, not later than the first century of the Christian era. In our notice of Mr. Fornander's first volume we ventured to treat with gentle irony the philological arguments by which this pre-Vedico-Ario-Dravidio-Cushite Polynesian pedigree is supported. For example, granting that Nuka is the Polynesian word for an island, we should not at once connect Arginusa or Ichnusa with Nuka, or derive them from the language of the Cushite Arabs. We also declined to see any necessary connexion between Aitu-Take, one of the Hervey group, and It or Ait, a famous ruler of Arabia, renowned in "Indian lore," and known to the Greeks as "King Aetus." Mr. Fornander has not been shaken by our opposition; nay, while he "sends his warm *Aloha*" (Cushite halleluia?) to several English critics, he does not greet us with this kindly salutation. But, as he returns in his preface and the early chapters of his second volume to his pre-Vedic theory of the origin of the Polynesians, we venture once more to express our opinion that certain of his arguments are not real proofs of his hypothesis.

Mr. Fornander says that the folklore of the Polynesians "refers to events in the far past, which have hitherto been considered as the prehistoric heirlooms of Cushites and Semites alone." He also finds in the race "some customs and modes of thought exclusively Aryan." Now it is an abuse of words, though a very common one, to speak of "Aryan customs and modes of thought." The term Aryan can only be scientifically applied to language. Professor Max Müller himself has protested against the wide and erroneous use of the word as employed by Mr. Fornander. There are no such things as "customs and modes of thought exclusively Aryan," and there is, probably, no savage or barbarous custom or mode of thought which "Aryans" cannot be shown to have known and practised. Again, we do not believe that there exist, in folklore, any "prehistoric heirlooms" peculiar to the Semitic race alone. The Cushites we leave to Canon Rawlinson and the *Anglo-Israel Banner*. This is a point which can only be illustrated, of course, by examples, and we have no room here to show that Semitic folklore exists, in a rougher form, among Bushmen, Zulus, Finns, and Basques. One instance may be mentioned. Mr. Fornander (vol. ii. p. 42) speaks of Naula-a-Maikes, who was swallowed by a whale and vomited up alive. "If this is not a remnant of ancient myths and legends brought with them by the Polynesians from their trans-Pacific ancient homes . . . it is, at least, a remarkable coincidence with the Jewish legend of the Prophet Jonah." But the myth of a person who is swallowed by a whale, an elephant, a sturgeon, or what not, and escapes alive, is common to Red Indians, Finns, and Bushmen. Did they receive it from Cushite or Semitic authorities? The truth is that the *märchen* of the tribes of earth are at bottom the same, and there is no reason why we should seek an origin for them in Semitic or Sanscrit literature. It is in Egyptian, or Sanscrit, or Semitic books that we first find the *märchen* in a literary form; but that explains neither their origin nor their distribution. To put the matter shortly, both

* *The Polynesian Race: its Origin and Migrations; and the Ancient History of the Hawaiian People, to the Times of Kamehameha I.* By Abraham Fornander, Circuit Judge of the Island of Maui, H. I. Vol. II. London: Trübner & Co. 1880.

popular tales of the marvellous and popular customs are such natural productions of the human mind in the savage and barbarous stages that they rarely afford any proof of community of race or of contact between races. They are peculiar to no race or races, they are human.

Mr. Fornander's second volume is devoted to the traditions contained in the genealogies of great Polynesian families. While we are prepared to admit that some elements of history must have been preserved in genealogies sometimes fifty generations long, we are less ready to allow that these historical elements can always be disentangled from the dross of legendary fancy. Again, we are less inclined than Mr. Fornander is to calculate periods of time by assigning thirty years to each generation. Our author himself admits that many genealogies are distorted, and many are amplified, by family pride and the conceit of bards and other inheritors of tradition. But this is no new critical problem. The best opinions are still divided as to the way in which we should understand the heroic legends and genealogies of Greece and of Iceland. What is the historical element, what the legendary, in the story of Jason, and the quest of the Fleece of Gold? This is but one instance of genealogical records and legendary tradition, often very coherent and plausible, which meet us in the early history of Hellas. For our own part, we can only discern two points of light in the question. First, when the adventures of the heroes of the Greek genealogies meet us also in the heroic legends of China, Finland, and New Zealand, and in popular fairy tales, we think these adventures may be regarded as mythical. It is impossible for us to discover who were the original narrators of these stories. We cannot accept them as historical, yet the Greek heroes of the tales have coherent genealogies connecting them with historical families. We have only discovered one error of three generations in all the legends of the *Odyssey*. Again, we may accept the accounts of institutions given in such traditions, as more or less true of the age which told the story, especially if analogous institutions are found to have an historical existence among known peoples. Perhaps we might also accept legendary accounts of great movements and migrations of peoples as not unbased on fact. Mr. Fornander, however, is inclined to believe much more in the historical truths of the Polynesian legends. We cannot give more credence to them than to the tales of Danaus and *Ægyptus*, or to the legends of the Paladins genealogically connected with the great historical French houses. Mr. Fornander says, "We believe the Icelandic folk-lore which tells of exploits and voyages to far distant lands," and why should we not believe the Polynesian? Well, so far as Polynesian legend talks of long voyages between the various groups, we may accept that general fact as historical. But the Icelandic genealogies in the *Sagas* are usually brief, and concerned with persons removed but by a few generations from the age of the narrator. The Polynesian genealogies, on the other hand, are as long as those of the MacLaines of Lochbui, and other Highland houses, and run back to the most distant and foggy antiquity.

The Hawaiian genealogies carry their principal line of chiefs "up to Nanaulu, or some forty-three generations ago. On the principle of allotting thirty years to each generation, this gives us twelve hundred years, and takes us back to 680 A.D." But, just as in the case of Highland genealogies, the first pages are blank enough. "For thirteen or fourteen generations, or between four and five hundred years, I find nothing in Hawaiian legends, except the bare genealogical tree, to indicate even the faintest ripple of national life and existence" (vol. ii. p. 5). About the commencement of the eleventh century, however, we come to a kind of epic, or heroic age of Polynesian legend, like the time of Pelops, Danaus, Jason, the Trojan cycle, and the rest, in Hellenic legend. "An era of national unrest and of tribal commotion seems to have set in," says Mr. Fornander. After, and perhaps as a result of a period of excitement, Mr. Fornander finds in the legends traces of customs previously unmentioned, as more stringent tabus and human sacrifices. "In support of this surmise, I may state that in all the legends or allusions referring to the period previous to this migratory epoch, I have found no indications of the practice of human sacrifices, though they may have existed" (vol. ii. p. 61). But how could Mr. Fornander expect to find indications of any institutions before the "migratory period," if, as he had already said, he "finds nothing in the Hawaiian legends except the bare genealogical tree"? While we admit that the stories of migrations may be echoes of facts, we cannot feel at all certain that the heroes of the stories are historical characters, any more than Pelops or *Ægyptus*. Of Kahai, for example, the legend says:—

The rainbow is the path of Kahai.
Kahai passed on, on the floating cloud of Kauai,
Kahai passed on the glancing light.

And, again, of Kaulu:—

Rainbow colours, morning light,
He is the one who spreads them out.

No solar mythologist will read these lines without feeling confident that Kahai and Kaulu are, not historical characters, but "solar heroes." We have no such happy facility of guessing; but the well-known character of all early legends makes us hesitate to look on Kaulu and Kahai as more real than the Finnish Ilmarinen or Wainamoinen. They seem to us like knights of the *Mabinogion*, misty figures in the *Turk Truveth*. These doubts will probably be felt by most comparative students of national traditions. Mr. Fornander has industriously compared all extant variants of the genealogies, and thinks it "possible to disentangle the apparent

snarl of the various versions and reduce the pretension of the Hawaii and Maui genealogists and bards to limits conformable with historical truth." But Grote's scepticism about the possibility of any such operation seems to us well founded.

Much more interesting and valuable than Mr. Fornander's attempt to disengage personal history from the legends are his notices of institutions such as the Aha-Alii, a kind of court of noblesse, with gradations of rank and of tabu. All this passage (vol. ii. pp. 28-30) is worthy of the study of inquirers into the history of institutions. The story of the abduction of the Lady Iiina, however, seems almost as like a legend of a Polynesian Helen the Fair as a tradition with an historical basis. Another legend (vol. ii. p. 75) resembles the beginning of the story of Theseus, and a Scythian *märchen* handed down by Herodotus. Very curious are the traditions of shipwrecked white men, possibly Japanese or Spanish (vol. ii. pp. 81, 106-109). When Mr. Fornander reaches modern history, he tells the miserable story of Captain Cook's adventures and death with singular spirit and impartiality. His tendency is to defend Cook against the charge of intentionally allowing himself to be deified as Lono; but, we say it with regret, the evidence of Captain King (vol. ii. p. 175) looks rather the other way. The fortunes of poor Cook's body and bones have a ghastly interest. This volume seems to us infinitely more valuable than its predecessor. Would it be possible to publish, with notes and introduction, the texts of the Hawaiian genealogies? Then people could form their own opinions more decidedly than it is easy to do at present.

TWO FARMING NOVELS.*

HERE, by a coincidence, we have a couple of agricultural novels appearing simultaneously, with engagingly rural titles. One and the other would seem to have been written *con amore* by men who are thoroughly at home in their subjects, and both are readable and instructive to boot. But there the resemblance between them ends. Mr. Tanner, as may be supposed, being Professor in an Agricultural College, is all in favour of progress and scientific farming; while the anonymous author of *Stubble Farm* is more rough and ready in his application of principles, and rather wedded to the traditions of an older school. Leaving it to experts to decide between the rival systems, we may say that people who go to novels chiefly for amusement will find *Stubble Farm* the pleasanter reading of the two. It is a rollicking story, by no means artistically arranged, but full of animation and vigorously-drawn character. Up to a certain point it embodies the highly satisfactory experiences of two English farmers of the enterprising class of the old-fashioned days. They have sufficient capital, and spend it with spirit; they grudge nothing in reason to the land, according to their lights; they treat their people generously, though they look to have work for their wages; and for themselves they are up with the early ploughmen and are always willing to turn their hands to anything. In spite of indifferent seasons and severe agricultural depression, we see no reason to doubt that Mr. Strong the second would have triumphantly surmounted his difficulties and died well-to-do like his father. It needed something more than foreign competition to ruin him. So his fate comes to him in the form so familiar to novel-readers, of trust responsibilities which he is careless in discharging. Even then he would have met his obligations honourably, though he might have had to throw up the lease of the *Stubble Farm*. But he is brought to insolvency and a melancholy end by the scientific extravagances of Mr. Strong the third, to whom, by somewhat involved private arrangements, the *Stubble Farm* has been transferred. Not that science is altogether to blame; for young Mr. Harold Strong is lamentably wanting in discretion, besides being far too much of a fine gentleman, and having married a girl who is a superfine young lady. Still science directed by ignorance and inexperience does a great deal more harm than good. Harold buys a steam-plough, and sets it to work without previously studying the strata of the ground. Consequently he turns up an unkindly subsoil, throwing it on the top of land that has been brought into capital heart by a long course of liberal manuring. And so the unfortunate young fellow cuts his own throat with the deep ploughshares he has introduced with a flourish of trumpets. But, as what is one man's poison may be another man's meat, the case is exactly the reverse with Professor Tanner's hero. That astute young *élève* of an agricultural college likewise goes in for serious steam-ploughing, with results that are the marvel of an excited neighbourhood. But then he had rented lean and neglected acres, and had struck treasures of virgin mould beneath the surface. The result is a show of arable land that looks as if each foot of it had been wrought by spade husbandry, and which blooms like a garden with miraculous crops.

But we have been hurried forward to the sombre *dénouement* in the concluding chapters of *Stubble Farm*, which is in contrast with the brightness of the bulk of the volumes. If Tom Strong was ruined before he was well past his prime, he had thoroughly enjoyed his prosperity while it lasted; and at his commodious homestead of the *Stubble Farm* his lines had fallen to him in

* *Stubble Farm*; or, *Three Generations of English Farmers*. By the Author of "*Ernest's Struggles*," &c. London: Tinsley Brothers. 1880.

The Abbott's Farm; or, *Practice with Science*. By Henry Tanner, M.R.A.C., Professor of Agriculture in the Royal Agricultural College. London: Macmillan & Co. 1880.

pleasant places. The introductory pictures of the farm and its surroundings, in their highly-coloured painting of rural abundance, suggest an easy rent and a handsome balance at the county banker's. We see half-a-dozen pairs of magnificent horses ploughing in the rich loam, in all the lustre of their shining harness and to the music of the jingling bells. Of course there is a superb show of old wheat in the rick-yard; the straw-yard is filled with prime young feeding-stock; the cows come trooping in with swollen udders to yield pailfuls of frothing milk; and a herd of short-legged hogs are being fattened for pork and bacon among poultry of all kinds, from peafowl downwards. Above all, there are servants who have been brought up under "the young master," having worked from their boyhood under his father before him. They have learned to take a personal pride in the farm, and have come to consider Mr. Strong's interests as their own. The consequence is that everything has prospered; things seem to go upon greased wheels, as between the employer and his head labourers; and Tom Strong, with few cares in the world, leads the active but jovial existence of the most fortunate of gentleman-farmers. He shoots and courses occasionally, and takes a day now and then with the hounds. He keeps a plain but excellent table; he sends his boys to a good middle-class school, and includes a governess in the strength of his domestic establishment. He enjoys admirable health and exuberant spirits, so that when taking an outing in the way of business, in the company of a kindred spirit, he breaks into something like vulgar "larking." But, on the whole, Tom is a hearty good fellow, filling the station in which Providence has placed him with pleasure to himself and profit to his dependents. In the *Stubble Farm* we have these pleasant pictures of the farming in the olden time which seem to be fading from the face of English rural society, as George Eliot and other writers have depicted it.

The man to hold his own in the new state of things is young Mr. John Holmes, the tenant of the Abbott's Farm. He is believed to have rented the land on reasonable terms, and has every opportunity besides for developing his advanced views. For forty years the farm had been in the hands of an easy-going gentleman, who had been content to pay his way and do his farming in the old-fashioned grooves. Mr. John goes in for a sweeping revolution. He is pledged by his antecedents to cultivate up to his character, which stands deservedly high in scientific circles. He has distinguished himself at the agricultural college, and has been holder of the Wrexborough scholarship. That he is brimful of ingenious theories we may easily conceive, but intuition with him seems to take the place of experience. He has an extraordinary flow of well-chosen language, and is a master in those arts of practical logic which make converts offhand in the most improbable quarters. From our personal observation of human nature, and, above all, of human nature in the country districts, we should say that his ideas must have been scouted notwithstanding their intrinsic merit, and himself held up to general detestation. He has no notion of dealing gently with prejudices; he is most uncompromising in the statement of his startling opinions; he dogmatizes in a tone of authoritative infallibility that will tolerate no reply; and quotes chemical facts and scientific figures with a fluency that should have sent his primitive interlocutors into fits. As a matter of fact, however, Professor Tanner's hero is always left in command, not only of the argument, but of the situation. His father has been long in occupation of a farm adjoining his own. Mr. Holmes, junior, sets to work at the vulgar process of teaching the old gentleman "to suck eggs." He broaches plans the bare statement of which somewhat scandalize the intelligent senior, who nevertheless hastens to subscribe to them cordially, on the simple explanation of the young enthusiast. That may be set down perhaps to paternal partiality. But it is just the same with poor Farmer Watkins, who sets up his opinions chapter after chapter, that they may be summarily bowled over by young Mr. Holmes. When John Holmes has found an hour or two to spare, and that has been a matter of no little difficulty, owing to the methods of his habits of work and the quick succession of his numerous engagements, he walks over to call upon Watkins, who is his nearest neighbour. A stroll round Watkins's antediluvian farm well repays him for his trifling sacrifice of time. His unfortunate host is unmercifully snubbed as he directs attention to those sights about the place which had always been the pride of his honest heart. His visitor sneers alike at his implements and crops, and humbly suggests mackintoshes for the unfortunate stock that stand shivering in the wet and the open stackyard. After all, Watkins ventures to call Mr. Holmes's attention to one arrangement which he hopes is above criticism. It is a covered pit for the reception of liquid manure; and he appeals to the fragrant aroma exhaling from it as evidence of the richness of the quality. Even there his irrepressible guest has been smilingly lying in wait for him. Holmes rejoins, triumphantly, that the very strength of the smell is conclusive against the folly of the deluded Watkins. It shows that those fertilizing particles which ought to have been fixed are escaping, to be caught in due course by the "nets" he has spread over the surface of his steam-ploughing. In short, Farmer Watkins is routed horse and foot, whether he tries to make a stand on his fattening stock or his root crops; and, having been introduced into the story to point a moral, he and his household are turned into a terrible example. He dies and leaves his family almost destitute. What is more, his pretty daughters are helpless, having been idiotically educated above their station; and are only saved from penury and worse by the benevolent interposition of Mrs.

John Holmes, junior. For Mr. Holmes had found a 'helpmeet' worthy of him in a young woman who brings him all the virtues for her dower. Mr. and Mrs. Holmes are the beneficent geniuses of their neighbourhood, and, carrying their spirited and munificent squire along with them, almost revolutionize the neighbourhood. They found an Industrial College for young ladies; they promote independence among farm labourers by judicious assistance; they instruct them in all the advantages of life insurance; they encourage lectures which draw admiring audiences; they find the funds for female agricultural scholarships; and are the authors of an infinity of useful minor reforms. It is sad to relate that, after all, the self-sufficient Mr. Holmes is brought almost as near to the brink of ruin as the energetic but unphilosophical Tom Strong. Only while Strong has come to insolvency in spite of his farming, it is high-farming that has landed Holmes in his difficulties; and is only extricated by the timely interposition of the Squire, who rewards his scientific enterprises by the offer of a lucrative land agency. We have already remarked that Professor Tanner's little book may be read with considerable profit. But it proves just as much or as little as any fanciful story that is written with a purpose, and in support of certain preconceived conclusions.

WHEATLEY'S SAMUEL PEPPYS.*

IN this well-printed and truly readable volume Mr. Wheatley has turned his gifts as an antiquary and as a pleasant writer to good account. It might, indeed, be asked whether there was any need to go outside the *Diary* for an account of Pepys and his world; for of all gossip Charles II.'s Clerk of the Acts is the prince, and of all autobiographers he is the most candid. But Mr. Wheatley has distinctly "shown cause." He has done, *mutatis mutandis*, what a college lecturer does with his Horace's Epistles or his Cicero's Letters; he has given the history of the work, has thrown together the allusions, has written chapters to elucidate points that Pepys himself took for granted, and has gathered into a focus the scattered indications of the writer's character. The book has chapters on Pepys before, in, and after the *Diary*, on his books and his friends, on London, the Court, the public characters of the time, on Tangier, whither Pepys was sent with Lord Dartmouth in 1683, on the navy, on manners and amusements under the Restoration. A number of appendices are added, one of them a list of plays—they are more than one hundred and fifty in number—which Pepys saw acted, giving an interesting bird's-eye view of the Restoration theatre; another, a list of the Secretaries of the Admiralty, communicated by Colonel Pasley, being a real contribution to the history of the navy.

Pepys was born in 1632, either at Brampton, near Huntingdon, or in London, where his father, though a member of a good old family, was a tailor. He was educated at St. Paul's School and at Magdalene College, Cambridge; at twenty-three he married a beautiful French girl, Elizabeth St. Michel, daughter of a queer visionary who had been "gentleman carver" to Queen Henrietta Maria, and who spent his later years and most of his sorry substance in taking out patents for inventions. Mr. Wheatley gives a list of them in an appendix, and odd inventions they are—contrivances for curing "smoakeing chimneys," for keeping horse-ponds free from mud, for moulding bricks, not to mention other and vaster schemes which never came to the patent stage, such as for raising submerged ships and working the gold-mines of King Solomon. Mrs. Pepys, charming creature as she seems to have been, and oddly matched with her matter-of-fact husband, shows traces of her parentage. When the *Diary* opens, we find Pepys already married, and on the look-out for a living. The *Diary* begins on January 1, 1659-60, and ends—the author's eyesight failing him—not quite ten years later, May 31, 1669. Coleridge, in one of those manuscript notes of which he was so prodigal, speaks of this loss of Pepys's eyesight as "a greater and more grievous loss to the mind's eye of his posterity than to the bodily organs of Pepys himself. It makes me," he goes on, "restless and discontented to think what a diary, equal in minuteness and truth of portraiture to the preceding, from 1669 to 1688 or 1690, would have been for the true causes, processes, and character of the Revolution." The point to be observed is that this "minuteness and truth of portraiture" spring from the fact that the *Diary* was written without any thought of what might be published and what might not. It was never intended for any one but the author to read, and, in fact, never was read by any one till more than a century after Pepys's death. The volumes which contain his invaluable record were all written in shorthand of an exceptionally difficult type, and were left without a clue to their interpretation. Mr. Wheatley thus recalls the circumstances under which they were first deciphered:—

When Pepys's library was presented to Magdalene College, Cambridge, by his nephew, John Jackson, in 1724, there were, among the other treasures, six small volumes of closely-written MS. in shorthand (upwards of three thousand pages in all), which attracted little or no notice until after the publication of Evelyn's "Diary." Then it was that the Hon. and Rev. George Neville, Master of the College, drew them out of their obscurity, and submitted them to his kinsman, the well-known statesman, Lord Grenville, who had as a law student practised shorthand. Lord Grenville deciphered a few of the pages, and drew up an alphabet and list of arbitrary signs. These were handed to John Smith, an undergraduate of St. John's

* *Samuel Pepys and the World he Lived in.* By Henry B. Wheatley, F.S.A. London: Bickers & Son. 138s.

College, who undertook to decipher the whole. He commenced his labours in the spring of 1819, and completed them in April, 1822—having thus worked for, nearly three years, usually for twelve and fourteen hours a day.

It was only a few years ago, as our readers will remember, that the final revision of these shorthand volumes and the publication of a "definitive" text was accomplished by Mr. Mynors Bright, President of Magdalene College.

The *Diary* has a psychological and an historical value; and it is of course in the latter direction that Mr. Wheatley attempts to supplement it. One of his best chapters is that on Tangier; a story of incompetence, corruption, and muddle, that even at this distance of time is enough to make an Englishman blush. Tangier was English for twenty-two years, from 1662, when it came into the King's possession as part of the dowry of Katharine of Braganza, to 1684, when Lord Dartmouth solemnly blew up the fortifications and evacuated it; and during all this time Pepys had much to do with the management and victualling of the town. It was managed by a Board of Commissioners in London, none of whom knew anything of it, and who were so well fitted for their work that, as Pepys said, none of them knew whether they were paying too much or too little for the mole which was to make a safe harbour for the new port. Immense sums were spent on this mole, and sums equally great found their way into the pockets of the managers at home. Pepys, who had a keen eye to his own interest, made a handsome profit out of his victualling; and he had powerful protection which relieved him from any danger of interference:—

In January, 1668-69, Lord Sandwich proposed that a paymaster should be appointed at Tangier, and suggested Sir Charles Harbord for the post; but the Duke of York said that nothing could be done without Pepys's consent, in case the arrangement should injure him in his office of treasurer. Our Diarist was much pleased at this instance of the kindness of the Duke, and of the whole committee towards him.

With such "vested interests" at headquarters, and with Governors like the celebrated Colonel Kirke, it is not surprising that Tangier should soon have been found an unprofitable holding. The Moors were for ever attacking it in the invariable fashion of those desert tribes—sweeping down upon detachments or convoys, and disappearing into the wilderness before vengeance could reach them. Moreover, political jealousy began to be excited at home. The House of Commons "expressed their dislike of the management of the garrison, which they suspected to be a nursery for a Popish army"—an odd suspicion, by the way, considering that the Portuguese Governor had resigned his post at the time of the cession to England rather than surrender the town to heretics. In the end, Lord Dartmouth (who took Pepys with him) sailed with secret orders to Tangier in 1684, and brought away the garrison, after destroying the mole and the fortifications. Decent people at home were ashamed of the whole business, of the little use that had been made of the "Key of the Mediterranean," of the "swearing, cursing and drinking" which were the staple of the life of the inhabitants, and of the humiliating but very necessary surrender. The one advantage that England derived from Tangier seems to be that Wenceslaus Hollar, commissioned by the King, etched some charming views of it.

Another valuable chapter in Mr. Wheatley's book is that on the Navy, with which Pepys was officially connected from the time of his appointment as Secretary to the Generals at Sea in 1660 to the Revolution. In many ways this chapter is not much pleasanter reading than that on Tangier; it is the same story of incompetence and corruption. Sailors unpaid and deserting to the enemy, officers jealous of each other and laying hands on each other's ill-gotten gains—this is the normal state of things in the English navy under Charles II. The Duke of York did his best to reform matters, and Pepys wrote for him a letter to the clerks of the office, which Mr. Wheatley calls a "most complete instance of a 'wiggling' given by the head of an office to his staff." But this could only mend the behaviour of the chief officials; it could not cure the fatal economical condition which was ruining the navy—which allowed the sailors to be paid by "tickets," and had to find money by means of bills that were commonly negotiated at a loss of 10 to 15 per cent. Perquisites and the sale of places were the rule. On a visit to Chatham Dockyard in 1661, with Sir William Batten, the Surveyor of the Navy, Pepys found the house of the Director or Commissioner of the Dockyard trim and comfortable. "I wonder," he says, "how my Lady Batten walked up and down with envious looks, to see how neat and rich everything is, saying that she would get it, for it formerly belonged to the Surveyor of the Navy." Pepys himself was offered 1,000*l.* for his place as Clerk of the Acts, and when he was promoted he did not scruple to divide the place between an assistant and a disreputable brother of his own. It need hardly be said that the navy was no worse than other departments at the time.

It is pleasant to turn from the chapters in which Mr. Wheatley describes the business and the pleasures of the England of the Restoration, from the pages quoted or adapted from De Grammont, and from the official records of ill-organized offices, to the chapters that relate to Pepys himself, and notably to that headed "Pepys's Books and Collections." This business-like, methodical, prosaic Clerk of the Acts was one of the most eager of bibliophiles, and he lived in a golden age when competition was not, at least in England. "Without flattery, I love to find a rare book for you," wrote Robert Scott, the bookseller of Little Britain, in sending him three choice volumes for thirty-four shillings. London, we know from other sources, was full of booksellers' shops, but purchasers hungry for treasures did not abound; and it was possible for a man who was

not particularly rich to amass the Pepysian Library, with its nine Caxtons, its precious MSS., its five folio volumes of broadside ballads, and all that makes the room in Magdalene College so choice a storehouse of good things. Pepys made a mistake now and then, as collectors do who "weed out" their collections; for instance, he exchanged a third folio of Shakespeare for a fourth folio—gold for brass, indeed, from the point of view of rarity. But what strikes the reader most in the matter of his Library, as in everything else, is the spirit of neatness and order, reaching to pedantry sometimes, that the man was possessed with. He numbered his books over and over again, to the despair of his wife and of all who have had to do with them since; he arranged them in the presses made by Sympton, the joiner, "to my extraordinary satisfaction," raising up the short volumes by means of wooden stilts to the height of their taller neighbours; he organized and re-organized till the thing was at last ordered aright. Here is a passage which Mr. Wheatley quotes (February 2, 1667-8), a passage which will commend itself to many a book-lover who is past the first fervour of youth:—"Whereas, before, my delight was in multitude of books and spending money in that and buying always of other things, now that I am become a better husband, and have left off buying, now my delight is in the neatness of everything." This excellent hint for the book-hunter shall be the last of our borrowings from Mr. Pepys and his introducer. We are grateful to Mr. Wheatley for bringing us across him again. There is an inexhaustible charm in the man, in spite of his vulgarity, vanity, folly, and his eye so steadily fixed on the main chance. In turning from his pages to those of the courtly Evelyn, we feel, indeed, much as Miss Burney's Evelina felt when she passed from the society of Polly Branghton to dance a minuet with Lord Orville; but Polly Branghton was at least flesh and blood, which Lord Orville perhaps was not. And, with all his faults, Mr. Secretary Pepys was unquestionably flesh and blood.

HAROUN ALRASCHID.*

PROFESSOR PALMER has been peculiarly happy both in the choice and in the treatment of his subject for the New Plutarch Series of biographies. The Caliph Haroun Alraschid (to adopt the popular spelling of his name) possesses many of the qualities which make a man's life worthy of record. His personal character was remarkable alike in its extremes of kindness and malignity, and his public history involves the records of the golden age of Mohammedan culture. Haroun stood to his Court in something of the relation which Lorenzo de' Medici held towards the men of the New Learning. Like the Magnifico he was a graceful scholar and a genuine admirer of letters; but at Baghdad in the eighth, as at Florence in the fifteenth century, it was the setting of the royal gem and not the jewel itself that gave forth the lustre which has ever encircled like an aureole the names of Haroun and Lorenzo. The portrait of Haroun Alraschid involves a picture of the Mohammedan world at the climax of its greatness. Never had the empire of the Arabs extended so far towards the four quarters of the globe; never had their rule been so powerfully impressed upon the distant provinces, always apt for rebellion; never had the will of one man received such unquestioning obedience over so vast an area, or that obedience been tested by a more uncertain or capricious will. And whilst Africa from the Straits to the Red Sea, and Asia from the Mediterranean to the Indus, waited anxiously on the unpredictable whims and turns of fancy of one changeable mind, the man on whom this burden of government lay was ever seeking to drown the horror of death by an endless round of amusements and pleasures, and surrounded himself not so much with the wise in statescraft and the learned in law, as with the gay in song and feasting, and the quick in repartee, the poet, the jester, and the buffoon. The Court of Haroun attracted most of the wit and talent of his empire, and all who possessed any gift in rhyming or jesting would come to Baghdad to try their fortune, and risk their heads, at the palace of the Caliph. But though the prevailing tone was certainly light and frivolous, and a joke was more worth than a judgment, there were not wanting men of science and learning, skilled in the reasoning of the Greeks, or well stored with the treasures of tradition, ingenious in theological casuistry and in the interpretation of the Koran, to complete the circle of wisdom, and make the Court a true reflection of the world which obeyed it.

Haroun Alraschid has also this advantage, that he needs no introduction. We have known the good Caliph from our infancy. He has taken us by the hand, and led us by night through the narrow winding streets of his capital—when he made those mysterious expeditions which are narrated in the voracious histories of the *Arabian Nights*. We know the scrapes he was always getting into, and the magisterial finale which eventually came to them all—the blessing of the deserving lovers, the rewarding of the good storytellers, and the magnanimous marrying of the most charming of the heroines, with which the good Haroun happily closed the adventures of everybody. But the legends are certainly vague; Haroun plays a subordinate part, as listener or judge, and is seldom a principal performer. It would be pleasant to be introduced to the home life of the Caliph and to

* *Haroun Alraschid, Caliph of Bagdad.* By F. H. Palmer, M.A., Lord Almoner's Professor of Arabic in the University of Cambridge. New Plutarch Series. London: Marcus Ward & Co. 1881.

learn something of his public acts and his private tastes. This Professor Palmer has accomplished for us—not quite for the first time, as the editors' preface claims, for Major Osborn has told us a good deal about the great Caliph—but certainly for the first time completely and independently, apart from the general history of Moslem rule. Professor Palmer gives a brief but sufficient sketch of the events which led to the establishment of the Abbassid power and the succession of Haroun, and then devotes himself exclusively to the Caliph and his government. The sketch is only designed for popular reading, and needless refinements of spelling, references to authorities, and other requisites of a scholar's treatise, are very properly eschewed. A clear portrait of the great Caliph, alike in his personal habits and his mode of governing his vast empire, is all that is wanted in this class of work; and Mr. Palmer may be congratulated on the successful manner in which he has seized the leading features and the skill with which he has grouped his materials. It has seldom been our good fortune to read so well written an account of a peculiarly interesting life. Oriental studies are too apt to be dry. Professor Palmer, however, is among the few who can breathe the life into the dry bones; and his present creation is full of interest and even charm.

It is the fate of the biographer to destroy illusions; and the life of Haroun Alraschid cannot be regarded as an exception to the general rule. The genial boon-fellow, the beneficent monarch, the patriarchal governor, on closer inspection proves to differ widely from the personage we know in the *Arabian Nights*. It is true enough that Haroun could be a pleasant companion over the wine-cup when he chose, and could do a generous act when he was in the mood; but the drawback to his amiable qualities was this question of the mood. No man was more uncertain of temper than this man on whose self-control depended much of the happiness and prosperity of half the civilized world. His dearest friends could never feel safe in their necks, and no soul could tell what the humour of the Caliph might be in an hour's time; and, so violent was his fury when it was excited, that no man in his empire dared approach him, for fear of instant execution. When angry, the Caliph stopped at nothing. The man who had given him the devotion of a life would be ordered to yield up that life for want of a clever retort, or perhaps for no reason whatever save that *le roy le veut*. One reason for Haroun's morbid and uncertain humour was the sleeplessness which seems to have been his normal condition at night, and explains the nocturnal frolics which are associated with his name in the *Arabian Nights*. The habit of turning night into day has produced ill-humour in other ages than Haroun's; but in his case the morning melancholy seems to have been unutterably desperate, and the misery of wakeful nights more than commonly hateful. In the delightful collection of stories which Professor Palmer has arranged as the final chapter (entitled "The Caliph of the Legend," occupying nearly half of the book, and unquestionably the most amusing and characteristic part of it) there is a deplorable picture of the depths of boredom to which Haroun Alraschid could descend:—

One night Haroun was very sleepless, so he sent for Jafer the Barmecide, and said, "I desire you to dispel the sadness and weariness which I feel. Allah has created many folks capable of cheering the sad—maybe you are one of them."

Said Jafer, "Let us come out upon the roof of the palace and watch the myriads of stars, how complicated and how lofty they are; the moon rising like the face of one we love, O Commander of the Faithful!"

"No," said the Caliph, "I have no mind for that."

"Then," said Jafer, "open the palace window that looks over the garden, and see the beautiful trees, and listen to the songs of the birds, and the murmuring of the waters, and smell the sweet odours of the flowers, and hearken to the water-wheel humming, with a mean like that of a lover who has lost his love; or sleep, O Commander of the Faithful, until the dawn arise."

"Nay," said the Caliph, "I have no mind for that."

"Then," said Jafer, "open the window that looks over the Tigris, and look at the ships, and at the sailors singing, sailing, working, and amusing themselves."

"Nay," said Alraschid, "I have no mind for that."

"Then," said Jafer, "O Commander of the Faithful, rise, and let us go down to the stables, and look at your Arab horses—beautiful creatures of all colours. There are steeds—grey, and chestnut, and dun, and bay, and white, and cream-coloured, and pied, and other colours—that would daze one's wits!"

"Nay," said Alraschid, "I have no mind for that."

"Then," said Jafer, "O Commander of the Faithful! you have three hundred girls who sing, and dance, and play; send for them all, it may be that the sadness which is on your heart will cease."

"Nay," said Alraschid, "I have no mind for that."

"Then," said Jafer, "cut off your servant Jafer's head, for he can't soothe his sovereign's grief!"—Pp. 170, 171.

In this anecdote the great Haroun appears very much in the light of a spoilt child "who does not know what to do," and it must be admitted that Jafer's fertility in expedients for driving away *ennui* is scarcely above that of a very mediocre nurse; still, the suggestion of the amusement to be gained by cutting off a head is a happy one. It was this intensely morbid and melancholy nature which made Haroun so exacting a monarch. He would not tolerate any one about him who was not good at something or another that would drive dull care away. He was, moreover, fastidious in his criticism, and would have nothing to say to a poor poem or a second-rate joke; on the other hand, no one was more appreciative of true merit in literature or burlesque, and no one more liberally generous to poets and humorists, so long as they kept up to his very variable standard and suited themselves to his ever-changing tastes. He would take a great deal of impertinence

in good part if it were accompanied with real humour. Abu-Nawwas, the most famous of the Court poets of his time, was constantly getting into trouble with his patron, and then extricated himself by a clever stroke of wit. For example, it is related that he and the Caliph were one day discussing the truth of an axiom laid down by the poet, that "An excuse is often worse than the crime," which Abu-Nawwas offered to prove that very night to the Caliph, who,

with a grim humour peculiarly his own, promised to take off the jester's head if he failed to do so, and went out in a rage. After a while, Haroun came in a somewhat surly temper to his harem, and the first thing that greeted him was a kiss from a rough-bearded face. On calling out violently for a light and an executioner, he found that his assailant was Abu-Nawwas himself.

"What on earth, you scoundrel, do you mean by this conduct?" asked the enraged sovereign.

"I beg your Majesty's most humble pardon," said Abu-Nawwas, "I thought it was your Majesty's favourite wife."

"What!" shrieked Haroun; "why, the excuse is worse than the crime."

"Just what I promised to prove to your Majesty," replied Abu-Nawwas, and retired, closely followed by one of the Imperial slippers.—Pp. 147, 148.

Another and more serious case is thus told:—

The Caliph, who was himself much addicted to drinking and otherwise violating the precepts of the Koran, one day in a fit of virtuous indignation ordered Abu-Nawwas to be executed then and there.

"Are you going to kill me," asked the poet, "out of mere caprice?"

"No," said Haroun Alraschid; "but because you deserve it."

"But," pleaded the poor fellow, "God Almighty first calls sinners to account, and then pardons them. How have I deserved death?"

"For that verse of poetry of yours, in which you say:—

"Oh, prithee, give me wine to drink, and tell me it is wine!

Let me have no concealment when plain dealing may be mine."

"And do you know, O Commander of the Faithful," asked Abu-Nawwas, "whether they gave me it, and I did drink?"

"I suspect so," said the Caliph.

"And would you kill me on suspicion, when the Koran says, 'Some suspicion is a sin'?"

"You have written other things," said Haroun, "which deserve death. That atheistic verse of yours, for instance:—

"None has e'er come back to tell

If he in Heaven or Hell doth dwell."

"And has any one come back to tell us?" asked the poet.

"No," said the monarch.

"Then surely you would not kill me for telling the truth!" said Abu-Nawwas.

"But," besides all this," continued Haroun, "was it not you who wrote those blasphemous lines:—

"Mohammed, thou to whom we look when trouble's storms arise;

Come on, sir, for we twain could beat the Monarch of the Skies."

"Well," asked Abu-Nawwas, meekly, "and did we?"

"I don't know what you did," answered the Caliph.

"Then surely your Majesty will not kill me for what you don't know."

"Cease this nonsense," said Haroun Alraschid, getting impatient.

"You have over and over again in your poetry confessed to things for which you deserve death."

"God knew all about those things," said Abu-Nawwas, "long before your Majesty did, and He said in the Koran, 'These poets are followed by their familiar demons. See'st thou not how they wander in every valley, and how they say things which they never do!'"

"Let the fellow go," said Haroun; "there's no catching him any way."—Pp. 149-151.

In the same way another man escaped his sentence of death by weeping, and explaining his tears by the remark:—"I am not afraid of death, for that is the common lot; but I am distressed to leave the world while the Commander of the Faithful is angry with me." Haroun laughed and spared his life.

Mr. Palmer is very right to insert so many stories of this kind in his book, for they throw more light on the character of the man and his times than any dry annals could give; and we must think that the long list of revolts in Chapter II., although useful as showing the difficulties of the central Government and the miseries of the "golden prime," might advantageously have been abridged. The mode of government and the haphazard manner of appointing governors adopted by Haroun are, however, well illustrated in this chapter, and this side of the Caliph's character is in some respects more important to chronicle than the better known private habits of the man. The chapter on the Fall of the Barmecides is a fine description of one of the most affecting episodes in Mohammedan history, and shows very clearly the cruel and passionate nature of the great Haroun Alraschid, which outweighed all his talents, his bright intellect, eloquent speech, and often affectionate impulses, in the scale of good and evil. He might have been a good man in a lower rank, but

the preposterous position in which he was placed almost necessarily crushed all really human feelings in him. It must not be forgotten that he inherited what was practically the empire of the civilized world; that he was the recognized successor and kinsman of God's own viceroy on earth; that he was the head of the Faith; that, in a word, there was not, and could not be, a more grand, important, or worshipful being than himself. . . . That such a man should not be spoilt, that such an absolute despotism should not lead to acts of arbitrary injustice, that such unlimited power and absence of all feelings of responsibility could be possessed with an unlimited indulgence, was not in the nature of human events. He was spoilt, he was a bloodthirsty despot, he was a debauchee; but he was also an energetic ruler; he humbly performed the duties of his religion, and he strove to his utmost to increase, or at least preserve intact, the glorious inheritance that had been handed down to him. If, in carrying out any of these views, a subject's life were lost or an enemy's country devastated, he thought no more of it than does the owner of a palace who bids his menials sweep away a spider's web. When he could shake off his imperial cares, he was a genial, even an amusing, companion, and all around him liked him, al-

though such as ventured to sport with him did so with the sword of the executioner suspended above their heads.—P. 223.

With all his faults, Haroun Alraschid cannot be charged with a want of individuality; his character was an original one both for good and bad; and Mr. Palmer's fine delineation of it is a really valuable addition to the treasures of biography.

MURRAY'S HISTORY OF EARLY GREEK SCULPTURE.*

IT is by no means easy to do justice to a volume of the weight and learning of Mr. Murray's *History of Greek Sculpture*. The pages are so full of interesting and novel statement, of abstruse reflection and ingenious theory, and of a knowledge evidently exhaustive so far as research has yet proceeded, that the reviewer is tempted at first to resign his critical position altogether, and confine himself to enthusiastic praise. It is a fact that, from a certain point of view, the scientific or exact, Mr. Murray's book does seem to us to demand something little short of undiluted eulogy. It is like the work of a thoroughly patient and competent German scholar of the days when German scholarship had not begun to flag; but unfortunately from the other, the purely literary, side, it has imperfections analogous to those that deform so much admirable German work. Mr. Murray's style is laboured and inelegant; he is always—as indeed an historian should be, but perhaps on this occasion a little in excess—more occupied with the matter than the manner of his discourse, and his sentences have the disadvantage of seeming isolated statements, instead of links in a long chain of argument. As a good deal of the work is distinctly dialectical, it cannot be denied that this absence of style interferes with the lucidity of the thought. It does not in the least destroy the permanent value of the book as a contribution to exact knowledge; but it will doubtless prevent it from becoming as popularly useful as so sound a work ought to become. Having stated the only fault we have to find with Mr. Murray's *History of Greek Sculpture*, we proceed to give some account of its contents.

The first chapter is occupied with a dissertation on the principles of composition in sculpture, which we cannot but regard as exceedingly valuable in these days when so many wild and fanciful theories of art are promulgated to perplex the public. Every young sculptor would do well to note the striking passage in which Mr. Murray remarks on the necessity that the artist should remain true to the nature of his material. This principle, understood by the Greeks from the very first by a happy instinct, has been singularly neglected by the moderns, who owe to their neglect of it many of their most perplexing failures. From discussing this point, and the speculations that arise out of it, such as the necessity of subordinating the design to the form of the surface or space to be operated on, the author proceeds to the consideration of realism and selection in plastic art. The phrases "realism" and "idealism" have been so idly abused in art criticism that we are glad to meet with a critic who has formed for himself a distinct idea of each. As Mr. Murray understands realism, it is the habit of slavish imitation of nature, without choice, without collation of types, without assistance from imaginative insight. It will be observed that there is some novelty in this view of the meaning of "realism," a view which especially lends itself to the art of sculpture. It has hitherto been used in serious criticism in a more favourable sense, as the force compelling art to return to nature after an indulgence in debased and conventional forms. In speaking of the modern sculpture of Western Europe we are accustomed to praise the realism with which Thorwaldsen in one generation and Rude in another recalled the sculpture of their time to a reverent, but not slavish, following of nature. But we notice that Mr. Murray, who mentions Rude only of all modern sculptors, speaks of him rather as a type of intelligent idealism than of realism. The fact is that there is no greater error than to strain too far in either direction the metaphysical signification of words, and the phrase under discussion may take two different meanings according to the starting-point of the argument, and so realism may be a term of reproach to a sculptor ascending towards Phidias and a term of eulogy to one contending against Canova. In this sense Mr. Murray finds himself obliged to blame the designs of the famous *Æginetan* marbles, although he expressly admits that here, upon the verge of perfection, realism had become rather forcible than coarse. When the threads are drawn so subtly as this, the differences of personal taste begin to perplex a critic; and so it happens that, from the days of Pausanias downwards, there have been people found ready to claim for Onatas, or whoever it was who was the moving genius of the *Æginetan* school, a higher place than for Phidias or Praxiteles. Mr. Murray gives a variety of details in which these friezes differ in their type of manhood from the sculptures of the Parthenon. It seems that Onatas, modelling obediently from nature, made the width between the hips a little smaller, the legs a little longer, and the arms a little shorter than Phidias afterwards decided should be the proportions of a perfect figure. Mr. Murray, like Raffaele and the world in general, prefers this slightly conventional type, which lends itself without doubt to the grander conceptions of poetic imagination. Yet something might still be said for the spare and muscular type which Onatas ob-

served before the Athenians first thought of improving a little upon nature. It should be noticed that the illustrations here given of the *Æginetan* marbles by no means suggest the peculiar rigidity of the originals.

Nothing is more interesting or inspiring than to follow the advance of an art when it is approaching, but has not yet reached, perfection. There is a subtle fascination in tracing the progress and yet incompleteness of men like Marlowe or Masaccio which it is impossible to feel in the case of Massinger or the Carracci. The goal is reached, the noon is over; we can hope for nothing better than a pleasant return, a graceful decline. The same early charm of suspended effort, of struggle and ascent, is given by the history of Greek sculpture just before its perfection. Mr. Murray presents to us, for the first time in any sane historical order, the successive masters as they appear very dimly in the pages of Pausanias and of Pliny, in ancient fragments and in later copies. Those who delight in such parallels will be able to find in Ageladas a sort of Perugino, with his pupils Phidias, Myron, and Polyclethus, who may vaguely represent Raffaele, Michelangelo, and Lionardo, while across the sea in *Ægina* there flourished in Onatas a sort of Albrecht Dürer. These comparisons, though beneath the dignity of historical criticism, are not without their value in popularizing history, and are less trivial than they seem, since human nature and the accidents of progress differ but little in each great age of discovery. Of the fame and prestige of Ageladas we hear much from Pausanias, who describes four or five works by him, none of which have descended to us in any form whatever. But in the case of his great pupils there is no lack of material on which to build a consistent idea of the paramount characteristics of each. Mr. Murray's plan does not permit him to speak of Phidias; but he gives us an elaborate and highly interesting account of Myron and of Polyclethus. From coins, and from late, yet now imperfect, copies in bronze and marble, we can obtain a sufficiently clear notion of the treatment of his famous group of *Athena* threatening the satyr *Marsyas* for attempting to take up the flutes she had cast away. Pliny, describing this work, says, or seems to say, for the text is difficult, "fecit Satyrum admirantem tibias et Minervam"; and the peculiar gift by which Myron dazzled his contemporaries seems to be hinted at in the word "admirans," he being the first sculptor who rendered violent emotion either in gesture or features. A relief evidently suggested by this group is to be found in the National Museum of Athens. Mr. Murray, who gives a figure of this relief, thinks that it may indicate the design of Myron's group; but of course it has not escaped the minute observer that the flutes are represented in the act of falling, and that the satyr so regards them. But this incident though possible in bas-relief, is impossible in the round, and therefore, not only the position of the flutes, but the attitude of *Marsyas*, must have been entirely different in the original. In the *Lacanian* fragment the satyr gazes with astonishment on the group before him, and the flutes may perhaps have lain on the edge of the skirt of *Athena*.

Myron, arriving on the stage just before the moment of fine perfection, seems to have shown a sort of vacillation, a curious inequality, in the extent of his invention. On some sides he remains conventional and archaic, where all his contemporaries were hastening to a more exact observation of nature. He was peculiar for his practice of treating hair in the rude antique manner. But he was a great master of movement; he introduced *genre* into sculpture; and the illustration of fleeting emotions, such as humor and passion, is attributed to him. Polyclethus, his fellow-pupil, seems to have followed and surpassed him in the rendering of human proportions. It will be observed that Mr. Murray, acting upon the distinct statement of Pliny no less than upon what can be gleaned of the character of Polyclethus's work, places him before Phidias, instead of after him, as has been usual. His position among the artists of his time was one of protest, and it is a touch which seems to us singularly modern that he wrote a pamphlet defending his theories against the practice of his contemporaries. His statues had none of the freedom and versatility of those by Myron and Phidias; he did not approve of their imaginative license. In the eyes of Polyclethus, delicate and accomplished workmanship, a subtle characterization within narrow limits, and the perfection of mundane grace, were better than all extravagant imaginings of the vigour and beauty of gods and demi-gods. Cicero speaks of his work as having attained an absolute technical perfection, and a soft delicacy of finish that has never been equalled. The bust known as the *Farnese Her* is considered the most beautiful specimen of the manner of Polyclethus now in existence, and as being not later than 450 B.C. His *Canon*, as it was called, a male figure which he carved as a deliberate model of selected beauty and proportion, is so entirely lost that it is a matter of dispute whether it was a *Diadumenos*, or athlete binding a crown upon his head, or a *Doryphoros*, or athlete holding a spear. Both these subjects were chosen by Polyclethus for famous statues, and a variety of copies and late statuettes exist which may be supposed to preserve the manner of the great master to some slight degree.

We have dwelt at length on those passages which have the most importance to the student of fine art, and have left ourselves no space for discussion of the scarcely less interesting chapters which appeal mainly to the antiquary and the scholar. The drawings of art in the Homeric age, the influences brought to bear on Greek handicraftsmen from Egypt and Phœnicia, the character of archaic industrial decoration—these are themes that never excited more curious speculation than at the present moment. Mr. Murray

* *A History of Greek Sculpture from the Earliest Times down to the Age of Phidias*. By A. S. Murray. With Illustrations. London: John Murray.

sums up our actual knowledge on these points with exhaustive skill. We leave to experts the analysis of his ingenious restorations of the Shield of Achilles, the Chest of Cypselus, and the Throne of Apollo at Amikyn. We can do no more than refer, with special approval, to his lucid disquisition on the archaic metopes of Solinus, the most important, because the most accurately defined in date, of all existing relics of ancient Greek art. In short, the book is full of valuable matter, arranged with such copious and conscientious references that it does not seem likely that it can ever be superseded, unless, indeed—what is scarcely to be hoped for—the results of excavation should present to us so many masterpieces of Calamis and Pythagoras and Canachus as entirely to revolutionize Mr. Murray's ingenious restorations of their style. In the meantime, we hope that the author will take up the thread of his history where he has dropped it, and in due time present us with a history of Greek sculpture from Phidias onwards to the decline of art.

THE MYSTERY IN PALACE GARDENS.*

MRS. RIDDELL is very severe upon the wickedness of the present age, but we greatly doubt whether by this, her latest novel, she will do anything to lessen it. Certainly, if her book does not do much harm, it will not tend to make the world a whit the better. She wishes, we are willing to believe, to write a moral story. In the end she rewards every one in accordance with his merits. The chief sinner commits suicide, and the minor sinners repent. A much-injured man finds that, "by some curious twist of fortune, eighty thousand pounds reverts to him." The virtuous heroine, in an eloquent country rector—the cousin and the heir of a Viscount moreover—gets such a husband as all virtuous heroines could desire. Her sister, who is by no means up to her level of exalted virtue, nevertheless finds such a husband as she deserved, and lives happily enough. Another young lady, who by marrying the man she loves loses a fortune of eighty thousand pounds, is rewarded by having for her husband the very man to whom the other fortune of exactly the same amount had so unexpectedly reverted. But the conclusion of a story is often the least important part of it. Many an author, like many a man who dies on the gallows, makes a very pious and a very penitent ending, and yet does little, if anything, to promote the virtue of the world. We could very well have done without his exit had he only spared us his entrance. No one could be more severe than Mrs. Riddell in her judgment of the age. She is hard enough upon Society, but she is still harder upon men engaged in business. For them she can never find too bad a word. For instance, she is describing London at the end of the season. "Dives," she tells us, "was gone. Clothed in his purple and fine linen he adorned the West-end no longer." This is harmless enough. Even rich men can hear about Dives with perfect complacency. But she goes on to say that "there was not much doing in the City, save cheating, which there, as elsewhere, goes on in season and out of season." The extravagance of such a libel as this only becomes tolerable when we consider its absurdity. The abuse showered by some of our writers on men of business in general would lead us to imagine that they themselves had invested in some worthless bonds and had paid the penalty of their credulity. Those who prefer high interest to good security are too apt to cry out against the world when they have really themselves to blame. Can Mrs. Riddell walk through the streets of London and see the vast trade that is carried on, and believe that it rests on a foundation of dishonesty? Does she believe that the thousands and tens of thousands of people whom she meets hurrying along the streets, each bent on some piece of work, are so many swindlers? She must be unhappy indeed if she has been thrown among men of business—City men of business—and has not found among them men of the highest honour. One great swindler is more talked about than a hundred honest traders, and it is by the talk that goes on that ignorant people form their judgment of the world. If a second Timon, living a life of wild wretchedness in his cave, should say that there was not much doing in the City save cheating, our pity would lead us to forgive him. But when such a charge as this is made in the pages of an indifferent novel, it is altogether another matter. Some City man might with reason turn round on Mrs. Riddell and say, "Madam, in your three volumes is there not a great deal of what is called book-making? Is not the story spun out? Have you not spoilt your work by making it bigger, in somewhat the same way in which certain manufacturers spoil their calico by adding worthless substances to it so as to increase its weight? Is there such a great difference between the 'padding' of a book and the shoddy in a piece of cloth?"

She might answer, and answer no doubt with truth, that she had not written a single line that she looked upon as superfluous. She might maintain that she had never troubled her head about filling three volumes, more or less, but had steadily kept to her plot and her characters. In that case it might be justly rejoined that, though her honesty is beyond question, nevertheless she is very ignorant of, at all events, one part of the story-teller's art. Certainly her three volumes might be very easily cut down to two, and yet the interest of her story be greatly increased. How easy,

for instance, it would be to cut out a few pages in which we are shown how the hero of the story "found himself commencing to understand the sort of dual life persons whose minds are well furnished from the storehouses of the past may lead in even the newest and least promising of neighbourhoods." He, by the way, lived in Kensington, which scarcely seems to answer to this description. However, "in a vague, inconsequent sort of fashion," he begins to think about the Roman occupation of Britain. Then he comes down to the time of Henry VIII., when "Linacre the learned" planted the first damask rose. "What lots of roses have come and gone since then!" remarks either the hero to himself or the author to her readers. From the roses the reader, in company with the hero, passes on to "the useful cabbage," and its introduction into England, and from "the useful cabbage" to "the firm, white-hearted lettuces," which in the days of William III. were sent over express from Holland. Hence, by a rapid transition, he is brought down to the accession of Queen Victoria. In a foot-note, that almost fills a page, he is provided with an account of Her Majesty's proclamation. He reads that in the courtyard beneath St. James's Palace was to be seen, on the 20th day of June, 1837, "an immense assemblage of persons, principally ladies of distinction, who vied in every demonstration of loyalty and devotion." We are gratified to learn that in this country enough ladies of distinction can be found to make up the chief part of an immense assemblage. We had hitherto thought that they did not exist in such vast numbers. From the proclamation he returns to the battle of the Boyne, and to Queen Mary's lying in state at Whitehall. The digression at last comes to an end, and the story begins once more to move on. In another part of the book we have a sermon reported at considerable length. The author calls her report "a mere outline of the sermon; the slightest skeleton of a discourse which the preacher's genius and earnestness made flesh and blood—a living, breathing humanity." If what we have given us is but the slightest skeleton, we trust that we may never come across the entire body. For the skeleton of a sermon—unlike most other anatomies—is far less terrible than the sermon itself. We must admit, however, that the author has some justification for introducing her preacher and his discourse. The hero is present in the church, and is greatly moved by what he hears. In fact, he wishes to make the priest his confessor. As the good man was on the point of asking the hero for the hand of his daughter—as he and every one else supposed the young lady to be—with the greatest promptitude he declines the position. In the end, however, the hero does make his confession, and nevertheless, though he is seen to have been a very great sinner, the marriage does take place.

Though the story is spun out in an intolerable way, yet it is not on account of its digressions and its multitude of words that we chiefly blame it. Mrs. Riddell, as we have said, sets herself up as one who judges, and severely judges, the world; and yet we fear that, in this story at all events, she takes anything but the right path towards its improvement. In the first place, there is often a certain tone of vulgarity in her writing. While she abuses society and the City, she manages to fall into the slang of both the one and the other. But, worse than this, she draws at full length the character of a most revolting woman, with whom she describes her hero, Sir John Moffat, as living for many years a life of sin. Now Sir John she paints as an almost perfect man. It is true that he had committed one great sin, and that his after life was mostly spent in making atonement for it. But it is inconceivable, every reader must feel, that such a man should have gone on living year after year with such a woman. The necessities of the author's plot required that the same man should be a treacherous scoundrel and yet a thorough saint. She had planned a conclusion in which he should display all the Christian virtues, and should rise superior in every way to the man whom he had so grossly wronged. Very good men may fall, as very good men have fallen; but no good man could have acted the part of Sir John Moffat. Either he should have been made a little lower than a saint, or the woman who spoils his life should have been raised a little higher than a devil. In spite of the good man's sufferings and his repentance, in spite of the wicked woman's suicide, in spite of the general air of magnanimity and devotion with which the book closes, we feel that it is unwholesome reading. Happily its unwholesomeness is often lessened by the folly of the language into which the author falls. Fortunately, moreover, it is when she is writing about the wicked woman that her words become most foolish. We have her at one time introduced to us "while, surrounded with mystery and bathed in an atmosphere impregnated with perfume, she stood in the stillness and majesty of the departing night beckoning him to her, beckoning him to her ruin." Many years later on, we see her "a woman possessed of imperial beauty; in middle age more striking-looking, more remarkable in appearance, more to be remembered with every accession of wealth and well-being, and assured station about her than" she had been—to cut the author's long description short—as described above. We then come upon her when "she wore a morning dress that was a master triumph of simplicity, fashion, and expense." Her ribbons were trembling, her ruffles were creamy-looking, her hands were white and lovely, and her hair was thick and luxuriant. We pass on, and we see her "in her sables and her velvets, in her rich attire"—something different from her sables and her velvets it would seem—"in the very zenith of her magnificent beauty." Yet again we are told of her "marvellous beauty, which had seemed something superhuman when seen by the glinting moonbeams under the arching trees."

* *The Mystery in Palace Gardens.* A Novel. By Mrs. J. H. Riddell, Author of "George Geith," "City and Suburb," &c. 3 vols. London: Richard Bentley & Son. 1880.

The husband—the supposed husband, we should say, of this splendid creature—rich though he was, so far neglected every accessory of assured station that by way of dinner he one day took “a chop and half-pint of bitter in the City.” It is no wonder that his very butler despised him, and the opinion of a butler—to judge by the important part that he always plays in such stories as these—is by no means to be treated with contempt. In one passage certainly—City man though he was—he rises in his language almost to the level of the author herself. He talks of a man who “elects” to keep open house. Surely so fine a word as that, if it is allowed to pass eastward of Temple Bar, should have been confined to those “incipient Lord Mayors” whom Mrs. Riddell more than once mentions.

While we find so much to condemn in this story, yet we cannot but feel that the author, if she would only follow better models, might yet write a novel that would be worth reading. Unhappily, she seems to have made her chief study in a bad school, and to be more familiar with the works of the least admirable writers of her own sex than with the great novelists of a better age. In one of her characters, the good heroine of the story, she shows that she has the power of drawing a character that is not deficient in virtue, attractiveness, or interest. When she next writes, let her leave off abusing the world, and do what she can to make it a little better by giving it a book to read which shall be both interesting and wholesome.

THE ITCHEN VALLEY.*

MR. SUMNER is a new and, we believe, a young member of the fraternity of etchers, but his work has already obtained recognition both in the Black and White Exhibition and in the Royal Academy, where he had last May several etchings, of which a mournful but powerful and attractive view, “Near Bruges,” will probably be best remembered. If he is not, in the narrowest sense of the words, a “true etcher,” he is in every sense a true artist. The true etcher, in the purely technical sense, is he who delights in the etched line for its own sake, neither attempting to conceal it nor to exceed its acknowledged powers and legitimate uses. Mr. Seymour Haden is perhaps the greatest living example of a true etcher. But between Mr. Seymour Haden and, for instance, Mr. Samuel Palmer, there are many degrees and kinds of departure from the orthodoxy of Rembrandt. The illustrations to Mr. Andrew Lang’s *Oxford*, published about a year ago by the same firm to whom we are indebted for *The Ichen Valley*, have little indeed in common with the art of Mr. Haden, and yet Messrs. Brunet-Debaines, Toussaint, and Kent Thomas are highly esteemed etchers. But it is remarkable that Mr. Sumner is as different from these three etchers as he is from Mr. Haden. He is, in fact, both an original and a courageous etcher, and with the thought, feeling, and draughtsmanship which are manifested in even his least successful experiments, he can hardly fail to have an important influence in the development of the English school of etching. In many of the plates before us we may look in vain for the familiar but indecipherable qualities of the pure etched line. It is lost or disguised, as Samuel Palmer loses or disguises it. But there are no tricks to be detected. The needle and the varnish, the copper and the acid, have done it all, apparently, only they have been set sometimes to unaccustomed tasks, and called upon for effects hitherto considered alien to true etching.

The question which at once suggests itself is, “Why not seek some at least of these effects by the shorter method of mezzotint?” In turning over the leaves of the *Ichen Valley* we do not often stop to ask ourselves whether the result is good. In most of the plates it is, and in some it seems to us remarkably good, so beautiful, in fact, that it is not without an effort that we assume a critical attitude, and constrain ourselves to examine how it is achieved. And yet there is surely no problem which etchers are at present more concerned to solve than this—“Can the best and most distinctive qualities of etching be preserved without speed, and can speed be attained without the frank display of the etched line?” The sense of power, for instance, and the freshness that comes of the instant translation of the thought into the picture—are these sacrificed or endangered? And if so, is the sacrifice or the risk compensated? Recollecting the tenderness, the poetry, and the true artistic beauty of such etching as Samuel Palmer’s, and having, too, before us such a kindred work as the second plate in this volume, we dare not answer yes or no; but, heartily commending the matter to Mr. Sumner’s consideration, pass on to make a few remarks on his book.

In the first plate, “Tichborne,” there is much that is pleasant, little that is startling. The reflections of the trees in the water are well given by the ordinary use of dry-point, and there is a fine bit of windy sky in the left-hand corner. On the right, however, there is a more original attempt to indicate small clouds in the upper atmosphere, which hardly strikes us as completely successful. The use of line in this instance is unlike Mr. Sumner, who, as we have observed, is not too fond of it.

The second plate, “Near Alresford,” is delightful both in conception and execution. As a picture, it somehow reminds us of Frederick Walker; as an etching, it undoubtedly suggests Samuel Palmer. And yet nothing is more certain than that it is Mr.

Sumner’s own. The moon is sending through the clouds broken light upon the mists which rise from Alresford pond. In the right foreground an old labourer drags weary limbs along the road. If you had met him in that gleam you would ever afterwards have thought of him and it together, for he and the moonlight and the misty pond and level meadows and black trees and hedges are together that one thing—the “motive” of a picture. The scale of the picture happily enables the etcher to treat the foliage in single deeply bitten lines, which, however, are of course quite different from the ordinary and typical etched line, which hardly exists pure and simple and uncrossed except in the orb of the full moon. The necessity from which Mr. Sumner could not escape, of thus expressing, by a conventional symbol, that to which line is perhaps least of all appropriate, is in itself an argument for the frank recognition of the limits of pure etching elsewhere. The shadows of the trees, too, on the field are just recognizable as a series of uncrossed lines, and are thus, we think, the least satisfactory, because the least harmonious, details in this very beautiful picture.

But it is impossible within our present limits to discuss, or even to notice, each of the twenty-two plates in which Mr. Sumner has illustrated the course of the Itchen. In the fourth, “Near Avington,” we have an interesting and by no means unsuccessful experiment in the rendering of middle distance foliage. The sky and the extreme distance in this etching are especially satisfactory; but the Itchen winding along the valley hardly presents so flat a surface as we could have wished. The sixth plate boldly confronts the problem of the long unbroken roof line of Winchester Cathedral. There is a remarkable honesty in the acceptance by the artist of this characteristic but unmanageable feature of the Cathedral; and, with the aid of several smoking chimneys and an admirably drawn tree in the foreground, he has succeeded in giving us a picture as well as a fact.

In the interior of the Lady Chapel (Plate 7) he is careful and accurate without being dull, and has made us feel that there is atmosphere between us and the traceried roof. No. 8, “The Soken Bridge,” is, whether from choice of subject or defect of light and shade, the least successful of the series; but the boys in the left foreground are well and vigorously drawn. Perhaps, in spite of the poetical and artistic charm of the second plate, the tenth, “Winchester College Chapel,” is altogether the best in the book. The leafless trees, whose interlacing branches form an open screen rather than a veil, the atmosphere behind them, and then after an interval the building itself, clearly, but not too clearly, seen, combine to make a picture as full of reverence as it is free from affectation. The subject of the next etching, “Seventh Chamber,” will commend it especially to Wykehamists, while its fine effect of firelight and shadow will interest artists who cannot claim that honoured title.

“S. Catherine’s Hill” (No. 14) strikes us as one of the best etchings of the set. In the sky we have once more something like an experiment, but this time it is an attempt to indicate and suggest rather than to imitate, and this is altogether more frankly an etcher’s work than most of the others. In the choice of his point of view, Mr. Sumner has pleasantly shown the originality which, in the preceding plate (S. Cross Brothers), wore almost an air of willfulness, if not of eccentricity. No. 15 (“View from S. Catherine’s Hill”) is not one of our favourites. There is a fine feeling of space, but the hill-forms in the middle distance are neither quite natural nor picturesque.

The two difficult skies in the 16th and 17th Plates are well and boldly indicated; but there is some foliage in the latter which seems to us the worst bit of work in the book. We have little fault to find with the last five etchings of the series. In the 20th Mr. Sumner has fully felt the appropriateness, as an etcher’s subject, of a wide stretch of calm water, with low mud banks, and the clear crisp lines of mast and sheet; and to these he has added a sky in which the wind has left long wreaths of torn and straggling cloud to witness to a stir and motion in effective contrast with the safe repose and indolence of sea and ships. This, then, is the Itchen at Southampton, and, after a capital view of the old Barge (No. 21), Mr. Sumner bids adieu to the river in a view of the Southampton Water, in which it is lost to sight before it mingles with the open sea.

In this last etching there is a very remarkable sky. A huge cloud sweeps over more than half the picture, and pours a heavy shower over the right distance, while the left is clear and bright. In this sky there is just that sense of speed and power which we value so highly. We cannot doubt that the artist watched the progress of that cloud, and that its huge volume, darkening the flat expanse of land and water beneath it, stirred his heart and urged his hand to swift decisive strokes. The bold and deeply bitten lines of the foreground are in perfect harmony with such a mood, and we turn from this, the last of Mr. Sumner’s etchings, with the conviction that, if he sometimes adopts unfamiliar methods, or accepts seductive compromises, it is not because he lacks the essential qualities of an etcher, or has chosen his art amiss.

We have confined our brief criticisms of the Ichen Valley strictly to the plates, because it is essentially an artist’s and not an author’s book, and the letterpress is properly subordinate and unambitious. It only makes us feel as if the artist were at our elbow, suggesting allusions, mentioning facts, recalling anecdotes, but, for all that gives unity to allusion, fact, and anecdote, pointing quietly to the plate before us—the result and expression of the brief hours when all these were fused into one motive by an emotion which entered at his eyes. Thus he starts with the derivation

* *The Ichen Valley, from Tichborne to Southampton.* By Heywood Sumner. London: Seeley & Co. 1880.

of Tishborne from Do Itchen bourne, leaves the tired peasant and the moonlight to interpret their own "song without words" by Alresford pond, and, even at the last, only silently reminds us how

The width of the waters, the hush
Of the grey expanse where he floats,
Freshening its current and spotted with foam
As it draws to the ocean, may strike
Peace to the soul of the man on its breast
As the pale waste widens around him—
As the banks fade dimmer away—
As the stars come out, and the night wind
Brings up the stream
Murmurs and accents of the infinite sea.

For all he tells us in so many words is that, "So ends the Itchen, in the quiet, matter-of-course sort of way, that all rivers join the sea, and the change steals gradually over the spent stream, as Southampton Water, with its broad shallows, leads on the breezy Solent."

A word of praise is due to the clever little woodcuts which occupy the place of initial letters to most of the chapters, and which we should have been glad to find explained in the list of contents. No pains have been spared in the printing and binding of the book. The paper is good and suitable, and the cloth boards are admirable both in colour and design. In fact, the same spirit of thoroughness seems to have animated the artist and his publishers, and they are rewarded by a completeness in the result which ought to make *The Itchen Valley* a strong new link between the public and this branch of art.

GERMAN LITERATURE.

THE enterprise of the veteran Ranke in beginning a universal history (1) at the age of eighty is of a nature to astonish those most impressed with the marvelous elasticity of his powers. The undertaking seems at first sight hardly less remarkable a feat than Odo the Censor's acquisition of Greek at the same age, or the octogenarian Pedro de la Gasca's restoration of the royal authority in Peru. A nearer investigation, however, somewhat diminishes the apparent arduousness of the task. Ranke's work is, strictly speaking, not so much a universal history as an essay upon universal history, bearing much the same relation to history proper as Voltaire's brilliant introduction to his *Age of Louis XIV.* does to the graver works which supplied him with materials. The treatment is, notwithstanding, thoroughly objective; the writer's aim of impressing his own views of the historical development of mankind upon the reader being attained not by dissertation or disquisition, but by the skilful selection and appropriate grouping of circumstances. The book is thus the most artistic that Ranke has ever written, and exhibits him in a totally new light. His former histories have been laboriously elaborated by the aid of archives, and have been indebted for their value to the painfully studious interpretation of these documents. In the present work the historian's power is again shown in his mastery over an overwhelming mass of material, but there is no endeavour after originality of research. Taking the incidents of the story as he finds them, he marshals them to their places, and briefly assigns to each group of events its proper station in the history of humanity. "There is," he says, "an historical life, which progressively propagates itself from nation to nation, from one group of peoples to another." To be the biographer of this historical life, to note how, beginning on the banks of the Nile, it lays hold, one after another, of all nations capable of civilization and draws them to itself, to fuse all at last into a moral and intellectual, if not a national, unity, is the aim of the historian. Egypt, Palestine, Assyria, Medo-Persia, early Greece, the conflicts of Greek and Persian, and the development of Hellenic civilization, Alexander's conquests and the rise under his successors of a culture embracing both Greek and barbarian, are the principal chapters and landmarks in this brilliant review, in itself the crown of a laborious life and the flower of a consummate culture. It adds little or nothing to the knowledge of well-informed persons, it offers the uninformed no adequate substitute for the current histories, but it exhibits, as works of more restricted scope cannot, the mutual connexion and independence of the histories of all civilized nations. The present instalment concludes with the African expedition of Agathocles, when Hellenism and Semitism seemed to hold each other in perpetual check, unconscious of Rome in the background.

The uprising of the Bavarian peasants in 1705 (2) against the Austrian troops, which had occupied the country after the battle of Blenheim, is an episode of which history has almost forgotten to take notice. It is a tragic story, terminating with a massacre of the insurgents at the battle of Sendling, and in great judicial severities. Dr. Schäffler has related it in an interesting style after the best contemporary sources of information.

The author of "Excursions of an Austrian" (3) informs us that he has been a steady opponent of absolutism in his native country, and that he is deeply impressed with the importance of Austria's civilizing mission among her Slavonic neighbours. One might,

therefore, have expected to have found more direct allusion to these momentous topics in his book, which is little but a reprint of light and lively articles about certain districts in Austria, about Heligoland, and on the history of the petty princes of mediæval Italy. They are, for the most part entertaining, but might have been left where they were without disadvantage to the national literature.

Alphons Thunn's work on the agricultural and industrial condition of Central Russia (4) since the emancipation of the serfs is, on the other hand, very valuable, and very dry. It is full of important statistics illustrating the various evils under which the Russian peasant groans—want of credit and capital, excessive taxation, excessive toil, worst of all, his own indolence and frequent dishonesty. The writer nevertheless regards these dark spots as in a considerable degree incidental to the present transitional condition of social arrangements. A considerable development of material prosperity may be looked for when the redemption of the land has been completed in the first quarter of the twentieth century; it is only to be feared that a hopelessly dependent proletarian class will in the meantime have been created.

Dr. Popper's essay (5) on mutual insurance among the poorer classes, especially from the legislative point of view, is interesting, from its bearing on the question whether such insurance should be made compulsory.

Röhrich and Meisner's collection of narratives of pilgrimages made by Germans to the Holy Land (6) contains twenty-three of these documents, between 1346 and 1588. These include, for the most part, details of the pilgrims' travels on the way to the Holy Land, which are frequently more interesting than their accounts of Palestine itself. There are also an historical introduction, a list of all known German visitors to the Holy Land during the period, and a bibliography, containing a thousand entries—the number, however, being made up by including Dr. Oswald Dykes's *From Antioch to Jerusalem*, which is no narrative of travel, but a treatise on the primitive Church. It is dangerous to catalogue or classify books without seeing them.

Herr Bühler's prize essay on the Old Catholic movement (7) contains nearly everything about it which readers in general can desire to know. One portion is historical, tracing its origin and development in the various Catholic countries where it has hitherto manifested itself; another compares it with the numerous attempts at reform upon a primitive basis which have already been made within the bosom of the Church of Rome, many of which have appeared exceedingly promising, but all of which have ultimately come to nothing. A third part treats of the prospects of the movement, which the author's attachment to its principles probably induces him to estimate too favourably.

Professor Preyer (8) occupies much the same position in Germany as Mr. Proctor in England—a lively and intelligent writer, not destitute of originality, but better known as a popularizer of scientific discoveries or speculations than for discoveries of his own, and with an especial preference for the outlying domains of research, suggestive of problems to which the present condition of our knowledge affords no solution. Such are spontaneous generation, the limits of sensuous perception, and hypnotism, which are all subjects of thorough discussion. Another interesting essay treats of the development of the rational faculties in the infant, under the appropriate title of "Psychogenesis." Interesting notes are added on the reanimation of dried or frozen animals or plants, the vitality of germs, and other curious and partly enigmatic questions.

It is some satisfaction to the student of an intricate and mysterious subject to encounter a guide who is quite sure that the clue to it is in his hands. The assurance may be a delusion, and yet cheerfulness and confidence are apt to prove inspiring. Every possible satisfaction of this description will be the lot of the Egyptologist who consults the moderate-sized volume into which Professor Lauth (9) has condensed the entire pre-Christian history of Egypt. Professor Lauth is no charlatan, but an independent and eccentric scholar, who reposes great confidence in methods of interpretation in which other Egyptologists repose very little, and whose confidence in his own judgment is absolutely unlimited. His claim is to have determined all important chronological dates with approximate accuracy, and to have found places for all Manetho's dynasties in consecutive succession without carrying the historical period further back than 4000 B.C. It is easy to allow for the seductiveness of such results to an ingenious and imaginative man; but their very neatness and completeness should have inspired him with distrust of their soundness. The orthodoxy of Egyptology may be relied upon to fill up the measure of what is lacking in this respect; it is only to be hoped that the apparently paradoxical character of much of Dr. Lauth's work will not deprive him of due credit for his ingenuity and suggestiveness.

The late Dr. Stark (10) was among the most eminent of modern archaeologists, and Dr. Kinkel's edition of his miscellaneous essays will be exceedingly acceptable. Among them are essays on the epochs of Greek religious history, on the myth of Niobe, a parallel between Pompeii and Præstum, and a notice of Mr. Newton's discoveries at Halicarnassus. Another class of papers refer to mediæval art, treating of the development of early German art from the Byzantine, of Leonardo da Vinci, and of Albert Dürer. Another division consists of biographical sketches of eminent archaeologists, including Crouzer, Böckh, and Kichly.

Dr. Soltan's treatise on the popular assemblies of ancient Rome (11) is a work proceeding from the school of Mommsen; so diligent and erudite that it can hardly be appreciated by those whose advantages for the study of the Roman Constitution have not equalled the author's.

Chamisso (12) belongs to the poets who have made a reputation at a stroke by a single production, not noticeably above the mass of their performances in point of execution, but embodying some idea which has taken the fancy of the reading public in every country. His *Peter Schlemihl* has rivalled the popularity of his friend Fouqué's *Undine*; the man without a shadow has been accepted as the peer of the maiden without a soul. Like Fouqué, he has written a great deal more, hardly inferior in literary merit, but he has failed to add another figure to the repertory of popular fiction. His poems nevertheless occupy a niche apart, honourably distinguished by their perfect finish, their generally objective character, and the clearness which might be anticipated from the poet's French extraction. His life was worth writing; even though, besides his emigration from France and his voyage round the world, it contains little that can be fairly called eventful. He was by no means one of the "problematic natures" that fascinated Goethe. Simple, honourable, and candid, he lived for his family and friends, producing and editing much good poetry, the most conspicuous figure of a very respectable Berlin literary coterie. His present biographer, with the centenary of his birth in view, has combined new material, chiefly of a domestic nature, with the narratives of Hitzig and Palm, and has produced a very creditable memoir, not hyperbolically, but perhaps somewhat too monotonously, panegyric.

Herr Reissmann (13) is confessedly one of the best writers of musical biography; industrious, clear, concise, and, from his technical attainments, able to satisfy alike the general and the professional reader. For obvious reasons, the latter gets by far the larger share of his biography of Sebastian Bach. Bach's music affords an inexhaustible field for criticism, and Herr Reissmann has done all that could be done with his uneventful life.

The second volume of Kamann's translation of Liszt's writings (14) contains the eminent virtuoso's essays on musical subjects and his letters while on his travels in the years 1837 and 1838. The former are declamatory, fantastic, and inconsecutive; the latter are excellent wherever, as is indeed most frequently the case, the writer does not attempt to philosophize, but contents himself with narrating what he has done or describing what he has seen. Elsewhere there is much affectation blended with genuine enthusiasm, of which the writer himself seems conscious, and which he endeavours to excuse at the expense of the age in which his lot is cast.

Thirty-five years and twenty editions sufficiently attest the merit of Vilmar's History of German Literature (15), which is probably the best of the innumerable works on the subject. The chief drawbacks are the angularities and asperities of the author's temperament, and the brief and inadequate treatment of the post-Goethean period, contrasting strangely with the pains lavished upon the middle ages. Heine, for instance, is dismissed in a paragraph, though for his own contemporaries at least he is of more importance than all the epics of chivalry put together. This deficiency was more excusable at the date of the original publication; but it is a pity that Vilmar's injunctions against altering his book should have been interpreted so strictly as to prevent Herr Goedeke, who has superintended the present edition, and is most competent for the task, from entirely rewriting the latter part of the volume.

Two new commentaries on *Faust* (16) present themselves with claims to attention that can hardly be described as competing, as

neither trenches upon the other's ground. One is philosophically abstruse, the other brief and practical; one excludes the text upon which the other is content merely to encroach. The more ambitious comment, by Oswald Marbach, displays thought and learning, but labours under the common defect of profound criticism, the defect of being alternately superfluous and obscure. It is true that the larger portion of it is occupied in grappling with the enigmas of the Second Part. How Herr Schriber will fare with this Sphinx remains to be seen; his notes on the First Part are full of sound, although, we should certainly have thought, frequently unnecessary, information. Can Germans of an age and capacity to study *Faust* really require to have *Regent, Marine, Metaphysik* explained to them? The introductory essay upon the origin and composition of Goethe's work, its versification, and its first representations, presupposes in the reader a considerable interest in literary history, to which it is an acceptable contribution.

Sir Orfeo (17), an English metrical romance of the middle ages, is edited from a thorough collation of texts, with copious notes and a full introduction, by Dr. Oscar Zielke. The publication is a valuable contribution to English philology, but apart from this the romance has considerable poetical merit, and the fable is very pleasing. It is a travesty of the myth of Orpheus, in which the mediæval King of Faerie plays the part of Pluto, but "Sir Orfeo's" conjugal affection and musical accomplishments are rewarded by a happy *dénouement*.

Ebers's new novel, "The Emperor" (18), is announced as closing the cycle of Egyptian fiction in which his talent as a novelist has hitherto been chiefly exercised. It is to depict Egyptian society under the Romans, as the last work of the series depicted it under the Ptolemies. The Emperor is Hadrian, and the story turns chiefly on the tragic and mysterious fate of his favourite Antinous. Antinous is represented as a faithful, affectionate, rather stupid person, attached to Hadrian with the blind fidelity of a spaniel, and laying down his life for him with a kind of dull enthusiasm which fails to move from its intrinsic want of reasonableness. There would have been the gravest ethical difficulties in depicting a more impassioned character, but the inanimateness of the portrait is nevertheless prejudicial to the novel. Hadrian's versatile disposition is far more interesting, but its traits are merely copied from antique portraits, and the whole, though true to nature, is heavy and lifeless. The descriptive passages show the author's usual mastery, but the prevailing want of action and passion renders "The Emperor" the least generally attractive of his fictions.

The sixth, and apparently the concluding, part of Freytag's "Ancestors" (19) displays a much more marked falling off. It is absolutely uninteresting, and seems to bear internal evidence of having been composed with difficulty and reluctance, merely from the supposed necessity of bringing the writer's prose epic down to nearly our own times.

With the exception of the first, a pathetic and elegantly told, but not very original, story of plighted love, all the tales in Paul Heyse's new volume (20) turn on those Italian themes which are his special predilection. The "Talented Mother" is perhaps the best—a lively, comic story of a love affair among visitors to the Eternal City, with enough of serious interest to keep the attention on the stretch, and terminating with a pleasant and unforeseen *dénouement*. In "The Posterity of Romulus," bright traits of ordinary Roman life are mingled with the hallucinations of an old painter devoted to Spiritualism, a situation suggesting reminiscences of Tieck and Balzac, and inviting a comparison, not wholly unfavourable to Heyse, with one of Mr. Henry James's recent stories. "The Witch of the Corso" is gloomy and melodramatic, with considerable tragic power.

The leading feature of the *Rundschau* (21) is the reappearance of Gottfried Keller, whose new tale, "The Motto," manifests as much freshness, humour, and genuine vitality as any of his earlier writings. Few writers are more thoroughly national than this painter of the modern Swiss, while at the same time he is by no means parochial. A more ambitious and prolific genius who aspired to paint, not only a nation, but an age, forms the subject of the first of Dr. Brandes's series of essays on modern French novelists. Few discoveries, biographical or critical, remain to be made respecting Balzac, but Dr. Brandes's remarks are judicious and well expressed. Karl Lamp, a recent traveller in Mexico, describes the two nations, utterly alien in character, which occupy that splendid country—the Creole minority of rich landholders and political and military adventurers, with its superficial education and glittering, but spurious, civilization; and the stubborn, stolid, unimprovable aborigine. The latter, Herr Lamp thinks, will get the upper hand, unless, he might have added, the Creole calls in the Anglo-Saxon. The provincial towns, he remarks, are getting more and more forsaken by the whites, and the concourse of the latter at the capital renders it for the time a most showy and apparently opulent city. Political

and legislative insecurity, however, cause the interest of money to rule very high; enormous fortunes are gained and lost; and these extremes, and the exclusion of the bulk of the population from public affairs, allow small chance of the formation of the middle class that might insure the stability of the Republic.

NOTICE.

We beg leave to state that we decline to return rejected Communications; and to this rule we can make no exception.

THE UNITED STATES.

The Annual Subscription to the SATURDAY REVIEW, including postage to any part of the United States, is £1 10s. 4d., or \$7 58 gold, and may be forwarded direct to the Publisher, Mr. DAVID JONES, at the Office, 38 Southampton Street, Strand, or to Mr. B. F. STEVENS, American Agency, 4 Trafalgar Square, London. International Money Orders can be sent from any office in the United States, and Subscriptions, payable in advance, may commence at any time.

PARIS.

Copies of the SATURDAY REVIEW may be obtained every Saturday of M. FOTHERINGHAM, 8 Rue Neuve des Capucines.

The SATURDAY REVIEW is duly registered for transmission abroad.

The publication of the SATURDAY REVIEW takes place on Saturday Mornings, in time for the early trains, and copies may be obtained in the Country, through any Newsagent, on the day of publication.

Copies of the SATURDAY REVIEW Bill of Contents will be forwarded every Friday Evening by post, prepaid, to any Newsagent in Town or Country on application to the Publisher.

Now ready, VOLUME L., bound in cloth, price 10s. Cloth Cases for Binding all the Volumes, price 2s. each. Also, Reading Cases, price 2s. 6d. each. May be had at the Office, or through any Bookseller.

ADVERTISEMENTS.

HANDEL, BY HOGARTH.

THE unique PORTRAIT of HANDEL, by HOGARTH, has been exhibited before H.R.H. the Prince of Wales and H.R.H. the Duke of Edinburgh, and has been seen and acknowledged to be Painted from Handel by Hogarth by W. Holman Hunt. Mr. Ruskin has also seen the Painting.

All Communications respecting this Picture address, FINE ARTS, care of Mr. Harris, 159 Piccadilly, St. James's, W.

THE GROSVENOR GALLERY.

WINTER EXHIBITION.

The GROSVENOR GALLERY Exhibition of Water-Colour Drawings, and Decorative Designs, by living Artists, NOW OPEN Daily, Ten to Six.

Admission, 1s. Season Tickets, 5s.

DORÉ'S GREAT WORKS, "CHRIST LEAVING the TABERNACLE," "CHRIST ENTERING JERUSALEM," and "MOSES BEFORE PHARAOH," each 35 by 25 feet, with "Dream of Hagar's Wife," "Christian Martyrs," &c. at the DORÉ GALLERY, 35 New Bond Street. Daily, Ten to Six. 1s.

WILTS and HANTS AGRICULTURAL COLLEGE. DOWNTON, Salisbury. For intending Landowners, Land Agents, Farmers, Surveyors, and Colonists. THE ONLY AGRICULTURAL COLLEGE in GREAT BRITAIN POSSESSING A FARM. SPRING TERM begins January 25. For Prospectus apply to the PRESIDENT.

THE NORTH LONDON COLLEGIATE SCHOOL for GIRLS, Sandal Road, Camden Road, N.W., will RE-OPEN on Thursday, January 20, 1881.

THE CAMDEN SCHOOL for GIRLS, Prince of Wales Road, N.W., will RE-OPEN on Tuesday, January 19, 1881.

THE Misses A. & R. LEECH'S SCHOOL for LITTLE BOYS will RE-OPEN on Tuesday, January 25, at 65 Kensington Gardens Square, Hyde Park, W.

SAINT PAUL'S SCHOOLS.—About TWELVE SCHOLARSHIPS will be Awarded next Term. For information address CLERK to Governors, Mercers' Hall, E.C.

D O V E R C O O L E G E. President—Earl GRANVILLE, K.G.

A Chapel and another new Boarding House have recently been completed. Each Boarder will now have a separate Bedroom. The 2nd place for Cooper's Hill, entries for Woolwich, Sandhurst, &c., have been obtained during the last year. Tuition from 13 to 18 Guineas. Board, £16 6s. For particulars apply to the Rev. W. BULL, M.A., the Head-Master, or W. KNOCKER, Esq., the Honorary Secretary.

LEAMINGTON COLLEGE. The NEXT TERM begins January 28th. Scholarships lately gained at Balliol, Queen's, Clare, Trinity Hall, Probus, for the Hertford. Twelve Certificates in July last in Public Schools Examinations. In the Junior School Boys are admitted at the age of Eight, and are prepared for Scholarships Apply, Rev. Dr. WOOD, College, Leamington.

B R I G H T O N C O L L E G E. The NEXT TERM will commence on Tuesday, January 25, 1881. F. W. MADDEN, M.R.A.S., Secretary.

ISLE of WIGHT PROPRIETARY COLLEGE, Limited.—Head-Master, the Rev. F. D. TEESDALE, M.A., Scholar of Winchester and New College, Oxford, late Head-Master of the Northern Counties College, Inverness. The SPRING TERM will commence on Friday, January 25, on which day it is expected that all boys will be at the College at 9.30 A.M. All particulars may be obtained from the Secretary, T. R. OWEN, The Cottage, Melville Street, Ryde.

S. PAUL'S COLLEGE, STONY STRATFORD.—Head-Master, the Rev. H. W. MCKENZIE, B.Sc., Oxford, late Sub-Warden of S. Paul's. A PUBLIC SCHOOL in accordance with Church of England Principles. Terms, Sixty Guineas.—Full particulars on application to the WARDEN. The NEXT TERM begins January 19.

B R U C E C A S T L E, T O T T E N H A M. Head-Master—Rev. W. AIMACK, M.A.

The main features of this School are its extreme healthiness, convenient buildings, and extensive grounds (30 acres), its system of education (which provides for special as well as ordinary requirements), and the thorough domestic care and organization. Few schools have greater natural advantages.

STRATFORD-ON-AVON.—TRINITY COLLEGE SCHOOL. The Warden, RICHARD F. CURRY, M.A., is assisted by Seven Resident Graduate Masters. Special attention paid to Modern Languages, Classical and Modern Studies. Junior Department for Young Boys. Exhibition to the Universities. Large Playing Fields, Gymnasium, 1,000 Yards, &c. Terms, 50 and 60 Guineas. Apply to the WARDEN.

PERCEVAL HOUSE SCHOOL, BLACKHEATH, S.E. Principal—WM. KIESER, M.A. The NEXT TERM will commence on January 25.

ST. EDMUND'S COLLEGE, SALISBURY.—A HIGH-CLASS SCHOOL for SONS of GENTLEMEN. The religious training is upon definite Church principles. Boys are Educated with much care and thoroughness. They receive individual teaching and help wherever needed. Candidates for Matriculation at the Universities are specially prepared. Terms, 25 a year. For references, prospectus, or any further particulars, apply to the Warden, Rev. G. H. BOURNE, D.C.L.

MORNING PREPARATORY CLASS for the SONS of GENTLEMEN (exclusively), 13 Somerset Street, Portman Square. The LENT TERM will commence Monday Morning, January 17.

STIFFORD'S BRIDGE, MALVERN.—Thorough PRIVATE TUITION, in a large country house, is offered on moderate terms to a few GENTLEMEN'S SONS willing to read.—Address, J. C. GAWTHRAK, M.A. Oxon.

CARSHALTON HOUSE SCHOOL, Surrey.—BOYS carefully prepared for Civil and Military Examinations.

CHIGWELL GRAMMAR SCHOOL, Founded 1620, on the borders of Epping Forest, offers a sound EDUCATION on the system of the Modern Schools of the Public Schools.—Apply to Rev. R. D. SWALLOW, M.A., Head-Master.

PREPARATION for the UNIVERSITIES, for the Naval, Military, East Indian, and Civil Services, for the Preliminary Examinations, for the Legal and Medical Professions, and for Mercantile and other pursuits. Head-Master and Chaplain, the Rev. J. WHITE, M.A., late Head-Master of the University Military College, and formerly Instructor in Mathematics at the Royal Military Academy, Woolwich. TERM commences on January 19.—Particulars as to Cadetships, Exhibitions, Scholarships, Prizes, Medals, Terms, successes of former Pupils, &c., may be obtained of the Secretary. By Order of the Council, ALFRED EAMES, Secretary.

Royal Naval School, New Cross, S.E., December 1880.

FOLKESTONE.—Mr. W. J. JEAFFRESON, M.A. Oxon., assisted by a Cambridge M.A. and competent Teachers, prepares PUPILS for the Universities, Woolwich, Sandhurst, and all Competitive Examinations. A few Vacancies.

PREPARATION for SANDHURST, WOOLWICH, and ENGINEERING.—Special advantages for speaking Modern Languages.—For Prospectus and further particulars, address R. VIDAL, Romville, Surbiton, Surrey.

SANDHURST, WOOLWICH, INDIA, HOME and CEYLON CIVIL SERVICES, &c.—WAITER WREN, M.A., Chaplain, and the Rev. H. F. GURNEY, M.A., Fellow of Clare College, Cambridge, prepare Resident and Non-Resident PUPILS for all Competitive Examinations. Twenty-four of their Pupils were successful in the late Competition for Sandhurst, including first, third, fourth, fifth, sixth, seventh, eighth, ninth, tenth, eleventh, and the first of the Queen's India Cadets. References can also be given to Parents and Guardians of numerous Pupils lately successful in the other Competitions named above, including the last examination for Woolwich.—Prospectuses at Water's Library, 57 Westbourne Grove, W.

THE IRISH DEBATE.

THE mischief caused by the calculated garrulity of the Land League members is confined to waste of time. They have within the last week done much to alienate any sympathy which may have been felt for their cause by the more violent democrats in England. In the last four divisions the Land Leaguers voted alone, having gone too far even for the BRADLAUGHS and JACOB BRIGHTS, who have up to this time zealously supported the cause of disorder. The managers of the faction have also contrived to diminish their own numbers by provoking the formal abandonment of their connexion by Mr. SHAW, Mr. BLENNERHASSETT, Mr. MITCHELL HENRY, and other respectable advocates of Home Rule. The orators of the *residuum* fiercely denounce the seceders, and exhort their constituents to exclude them from Parliament. It is impossible at present to know whether they will be able to enforce their threats, but the gradual expurgation of comparatively scrupulous partisans, which occurs to all revolutionary factions, seldom tends to their ultimate advantage. It is not to be regretted that Mr. PARNELL has been unable to maintain the tone of affected moderation which surprised the House on the first day of the debate. His offensive personalities, and his audacious denunciations of English rule in Ireland, may perhaps have gratified his followers, but they have weakened his cause. While the chief of the Land League for a time discarded his habitual tone of menace and invective, Mr. JUSTIN MCCARTHY has appeared in the novel character of a political fanatic. Readers of his historical work must be puzzled and surprised by the uncalculating enthusiasm of the cheerful and indifferent annalist who has now become Mr. PARNELL's lieutenant. Mr. MCCARTHY's new-born zeal blinded him to the monstrous anomaly, forcibly exposed by Mr. GLADSTONE, of a proposal that the Crown should, at the instance of the House of Commons, assume a dispensing power, and place a class of unoffending and loyal subjects outside the protection of the law. It was not until two days had been wasted in ostensible discussion that Mr. MCCARTHY became aware of the meaning of his own amendment. Like one of the minor performers at a Spanish bull-fight, he had discharged his self-appointed function by delaying for a time the decisive contest. Mr. DAWSON's amendment was less obviously irregular, and he also contrived to occupy many hours of the time of the House of Commons before Mr. THOROLD ROGERS's ingenuity hit the blot which had escaped the observation of the SPEAKER. Mr. O'KELLY violated only good sense and good taste, without directly infringing the orders of the House.

The amendment about the Irish borough franchise, though it proved to be irregular, was less outrageous in the form which had been selected for promotion of the common object. In performing his task of occupying time Mr. DAWSON found it necessary to digress into the subject of the municipal franchise, which he had forgotten to include in the terms of the amendment. It is neither customary nor reasonable to discuss in a debate on the Address the merits of a Bill which may or may not be hereafter submitted to Parliament. No issue was raised between Mr. DAWSON and the Government which represents the majority of the House, except the immediate urgency of a measure for deteriorating, if possible, the character of Irish constituencies and members. Mr. FORSTER is already pledged to

the proposed reduction of the franchise; and there can be no doubt of his sincerity. Perhaps Mr. DAWSON may be right in his belief that household suffrage would substitute for the Irish ATTORNEY-GENERAL a member of the social and intellectual level of Mr. BIGGAR. Mr. FORSTER would not agree with Mr. DAWSON that such a change would be advantageous; but he has through his whole career consistently preferred the theory of the widest popular suffrage to subordinate considerations of expediency, convenience, and personal fitness. Mr. FINIGAN suggested an excuse for the degradation of the franchise which may probably explain the reasons for agitating the question. The villages which pass for boroughs in Ireland are so insignificant that Mr. FINIGAN is returned by 240 constituents. If the whole adult male population were entitled to vote, he would be enabled to count a much larger number of electors. Whenever the matter is brought forward by the Government, the Conservatives will be well advised in abstaining from opposition. There is no use in irritating real or pretended prejudice by trying to maintain an undeniable difference between English and Irish institutions. The practical results of a reduction of the franchise will be insignificant, for it matters little whether the enlightened constituents of Mr. FINIGAN are swamped or are reinforced by an addition to their number.

Although obstruction is much less criminal than the tyranny of the Land League, it is possible that it may have a greater effect in arousing the indignation of the English constituencies. There are sections of the population which, perhaps, regard with complacency the cruel injustice under which the majority of Irish landlords are suffering; and they may not fully understand the wide operation of the machinery of Land League coercion. Irish landowners are strangers, and the public instructors who conduct provincial newspapers have systematically represented them as tyrants and oppressors. The House of Commons, on the other hand, derives its origin from the constituencies, and the PRIME MINISTER has not ceased to be the popular favourite. That Parliament and the Government should be systematically thwarted in the attempt to discharge their undoubted duty is not a form of anarchy which commends itself to English sympathy. The friends of the Land League are visibly alarmed by the consequences of the pertinacious defiance of English feeling which has diminished its capabilities of doing harm in Ireland. Day after day Mr. PARNELL and his followers are warned by sympathizing journalists that they are injuring themselves without causing equivalent public inconvenience. The election at Wigan apparently indicates a reaction which is perhaps directed rather against the agitators and their English abettors than against the Government. The issue of protection to life and property or complicity with lawless rule was broadly proposed to the electors. It was known that Mr. POWELL would vote for the measure which is invidiously described as a Coercion Bill; and his adversary, in deference to a number of Irish voters for the borough, of the estimated number of fifteen hundred, did not shrink from promising to oppose all measures for the restoration of order and liberty. There is no reason to doubt that the followers of Mr. PARNELL, the professed enemy of England, redeemed their pledge by voting for Mr. LANCASTER. The consequence was that the majority obtained at the general election by the

son of a powerful and popular nobleman in the neighbourhood was now exceeded by 450 votes. Whatever the verdict of Wigan is worth, it might have been thought that it was sufficiently certain; but the journal which has maintained a steady alliance with the Land League, and which has consistently opposed legislation in restraint of its despotism, was equal to the task of explaining the Wigan election away. The voters, it seems, returned a supporter of coercion against an opponent, because they were themselves opposed to exceptional measures, and, therefore, to the Government which proposes a Coercion Bill. That revolutionary passion should so utterly pervert the judgment of an able writer would be a startling paradox, if it were not conformable to many precedents.

The introduction, and even the passage, of a Coercion Bill is, at last, within sight, though it may possibly become necessary to alter during the debate the rules of Parliamentary procedure. Mr. DILLON'S threat that the enactment of the Bill will be met by a general refusal of rent is another illustration of the lawless spirit with which Parliament has to cope. The power which will be given to the proper authorities to effect arrests without the necessity of vindicating them by legal evidence will even now cripple the branches of the Land League by creating a wholesome terror in the minds of their paid agents. If the Habeas Corpus had been suspended in October the country would now have been peaceable; and it may not be too late to undo some part of the evil which has resulted from delay. When protection is afforded to the peaceable part of the population, it is not impossible that dissensions may arise among those who have hitherto obeyed the orders of Mr. PAT-NELL. The persecution which has been directed against liberal and improving landlords has thrown many labourers out of employ. In number they are about equal with the occupiers, and they will soon discover, if they are not already aware of the fact, that they are threatened both with permanent loss of wages and with perpetual exclusion from any share in the land. Peasant proprietors want no hired labour, and it is proposed that they shall have a monopoly of their farms. The vague and unmeaning promises addressed to them by Land League orators indicate a fear that the labourers may break loose from the guidance of the demagogues. The debates on the Land Bill, which is to follow the Coercion Bill, will end in the acceptance of the Government proposals, whatever they may be; but they will probably throw light on political and economic difficulties which have not been sufficiently considered.

CHILI AND PERU.

THE recent victories of the Chilians mark what may be the last phase of a war that has crushed Bolivia, desolated Peru, and severely taxed the resources and energy of Chili. The first stage of the war was the occupation by Chili of the territory which gave rise to the war. It will be remembered that the cause of quarrel was a district, mostly desert, but rich in nitrate and silver, which lies between Chili and Peru. It had been long uncertain whether this territory belonged to Bolivia or Chili, but an arrangement was at last effected by which Chili recognized that the territory belonged to Bolivia, but stipulated that Chilian citizens should be protected in their operations within the limits in question, and be free from onerous duties. Secretly encouraged by Peru, Bolivia broke its engagement and set itself to ruin the Chilian adventurers. Chili complained, and Bolivia replied by going to war, Peru immediately coming forward to her assistance. There was no shadow of justice in the conduct of Peru, but there was a deliberate and plausible calculation of profit. If Peru through Bolivia could get hold of the nitrate held by Chilians, she might, with her own supplies in addition, get a monopoly of the nitrate market, and come into a renewal of the wealth which she had obtained from guano and squandered. Chili had no vessel like the *Huascar*, and Peru might hope to command the sea, while the united forces of Peru and Bolivia might be thought to be more than a match for any force that Chili could send to the disputed district. War began, and its first stage was a series of successful operations by which Chili made herself mistress of the disputed district and of a portion of the southern territory of Peru, and so punished the Bolivians that they

virtually retired from the contest. The next stage was the struggle for mastery at sea. Chili again triumphed. The *Huascar* was captured, Peruvian ports were shelled or blockaded, and a small Chilian force was landed not far from Lima, to give a taste of the horrors of war to those who had stirred it up. Then came the third stage. Time ran on without any marked event, and the belligerents were mainly engaged with preparing for the great event of the war, the attack on Lima and its defence. This pause offered an opportunity of mediation, and the United States undertook the task. This attempt to bring the war to a conclusion failed, as Peru would not accede to the demands of Chili. What Chili asked for is not precisely known. Probably she asked not only for the disputed territory, but of some portion of the southern region of Peru which she judged necessary to secure undisturbed the possession of the district which had been Bolivian. Directly it was known that the negotiations had failed, the Chilians set themselves to the execution of the arduous and bold undertaking which they are now engaged in prosecuting, and the Peruvians collected the last forces they could muster to save their capital.

The Chilian expeditionary force is said to consist of 22,500 infantry, 2,400 artillery, and 800 cavalry, with eighty pieces of artillery and ten Gatling guns. The landing, which the Peruvians were not in a position to dispute, was effected at a point on the coast somewhat to the south of Lima. At a distance of eighteen miles from Lima, the Chilians came on a Peruvian force stationed at a little town called Lurin, near the coast, and connected by a railway with Lima. The Peruvians made a creditable resistance, but they were only a detachment from the main Peruvian force, which is said to amount to 40,000 men, and had to yield to superior numbers. This left the Chilians free to proceed to the attack of the main Peruvian line of defence. From Lima run two little railways belonging to the same company, and terminating in the same station in the capital. One goes to the port of Callao, which is defended by a fort of great natural and artificial strength. The other goes to the watering-place of Chorillos, a few miles to the south of Callao. The Peruvians thus held a triangle, its three points being Lima, Callao, and Chorillos, and it was necessary for the Chilians to break into this triangle before they could think of assailing the capital. Chorillos was not fortified, and it had therefore to be held by a large force. The latest news is to the effect that a battle has been fought at Chorillos, and that the Peruvians have again been defeated. The losses of the Peruvians have been heavy, but nothing is known as to the losses of the victors. Unless their losses have been so large as to disable them, they are now free to march on Lima. It is a fortified town, but the fortifications are said to be old, ruined, and worthless. It is not, therefore, the fortifications of Lima that would stop an assault; but men of Spanish descent, like most other people of the second class in military skill, fight well with walls to protect them. The Chilian commander will know that the cost of life in taking Lima will be very heavy, and it might not be easy to hold Lima, if taken with the remnants of an army which at its outset consisted of less than twenty-five thousand men. The alternative is to starve Lima into a capitulation. The country round the capital is so fertile and so highly cultivated that it is said to be like a garden, and the Chilians will therefore have plenty of supplies, while as it never rains at Lima, they have no inclemency of climate to fear. It is true that, whatever they do, they will have the fort of Callao behind them, and it is much too strong for them to take by a direct attack. But, if there is a large force there, it is sure to be starved sooner or later, as, with the command of sea and land, the Chilians can easily defeat any attempt to revictual the fort. If the force of the fort is small, it will not be able to give any serious trouble to the army operating against Lima. The Chilians throughout the war have shown equal prudence and energy; and, if they have meant to do a thing, they have almost invariably done it. If the Chilian general decides to assault Lima, the probability is that he will have had such good reason for his decision that he will be successful. But he may decide to remain passive, to cut off all supplies from Lima and Callao, and to wait for reinforcements from home.

Even the capture of Lima might not terminate the war.

The President of PERU may not choose to be shut up in the capital, and while there is still a road for withdrawal open to him he may prefer to take his army with him and get into the mountain districts, where the Chilians could scarcely follow him. But in these wild and sterile regions he could not keep his army together, and this army would break into bands of guerillas which would be always ready to sweep into the plains and harass the Chilians while seeking supplies. The war might in this way last an almost indefinite time. But the possession of the capital by an enemy throws everything into such confusion, so paralyses all organization, and so disheartens the population, that the suffering nation is sorely tempted to make terms at almost any price. Chili will now probably ask not only the territory in the south, which there is not the remotest chance of the Peruvians retaking, but a war indemnity. This indemnity will fall on the classes who will suffer most by the capture of Lima, and if they loudly protest that they would rather bear the future burden of an indemnity than face present ruin, their voice can scarcely fail to make itself heard. It may be remarked, too, that the President of PERU is nobody unless he is at Lima. There is no other centre of population and wealth to which he can escape, and from which he can wage a new war. A defeated man roaming about mountains would not be at all the kind of President to whom the people of Lima are accustomed. In Peru revolutions are always made at Lima. A revolution at Lima made the present PRESIDENT, and another revolution at Lima may unmake him. He has been able to carry on the war hitherto because he has maintained a reign of terror at Lima, and having the populace with him, he has been easily able to stifle the feeble voices of those who whispered that peace and not more war was what Peru really needed. If he goes away his reign of terror will be at an end, and there seems no obvious reason why the people of Lima should be loyal to him when they no longer see or fear him. They have only got to make a new President to terminate the war, and of all things to make a new President seems, to Spanish Republicans, the simplest. We may be sure that the PRESIDENT can make the calculation for himself as well as any one can make it for him. He is more likely to remain President if he stays at Lima, although he only stays there to witness its capture, than if he takes to the hills, and becomes in every sense an outsider. He could scarcely suppose that if he, as President, remained in Lima after it passed into the hands of the enemy, the war would go on elsewhere without him. He must contemplate the necessity of making peace if Lima is taken and he is taken with it. The Chilians may, therefore, be right in their calculation that, if they can but take Lima, the war will be at end, for a fugitive President would cease to be President, and a President who did not fly must make peace. No one can venture to predict what will take place in a Spanish Republic, but there are apparently good reasons for thinking that the Chilians, in making their great effort to terminate the war, have not miscalculated its effects if it continues to be successful.

THE GREEK DIFFICULTY.

SOME of the French criticisms on M. BARTHÉLEMY ST.-HILAIRE's despatch to Count DE MOUV are not unfounded; but the subject has lost much of its interest since the project of arbitration was withdrawn. It was perhaps injudicious to dilate in a formal State paper on the probability that war between Greece and Turkey would be followed by insurrections in the neighbouring States and provinces; and that disturbances in the East might not improbably involve some of the Great Powers in a general war. The concert of Europe ought not to be so lightly regarded by one of the Governments which are at present professedly acting in cordial co-operation. There is no reason why the Powers should allow turbulent little States to direct their policy; and, indeed, there is little risk of war if, as it is proper to assume, Russia is sincerely desirous to avoid a present disturbance of the peace. M. ST.-HILAIRE's language tended to furnish the Government to which it is addressed with an excuse for obstinate rejection of sound advice. The Greeks may naturally think, and perhaps they may say, that they at least have nothing to lose by movements which would be

directed, not against themselves, but against their adversary. It is nothing to them that Macedonia may be in flames, or that Bulgaria or Servia may welcome an opportunity of extending their present limits. As to the possibility of a European war, they may reasonably disclaim responsibility for a result which, if it occurs, must have causes more deeply seated than the attempt of Greece to occupy Epirus and Thessaly. The French Minister perhaps unconsciously used the arguments which had determined the policy of his own Government as reasons for the conclusions which he desired to impress on the Greek Ministry. France on sufficient grounds deprecates any proceeding which may tend to war; while Greece is not disinclined to profit by the occasion of fishing in troubled waters.

Although it may be inexpedient that diplomatists should indulge in rhetorical phrases, M. BARTHÉLEMY ST.-HILAIRE's despatch ought to have been deemed conclusive. The authority which he derives from his position supersedes the necessity of persuasion. The wishes and the resolutions of the French Government could not safely be disregarded, even if they were supported by much feebler reasoning than that of the FOREIGN MINISTER. At one time there was a certain apparent vacillation in French policy; and the uncertainty was attributed to a difference of opinion between the responsible Ministers and the leader of the Republican party. It is now well understood that M. GAMBETTA has either modified his former opinion, or deliberately abstains from interference with the policy of the Cabinet. Public opinion is unanimous on the expediency of avoiding diplomatic complications which might lead to war; and Greece may be well assured that M. ST.-HILAIRE speaks with full authority in the name of his country. On one material point he is an unimpeachable witness. The Greek Ministers affect still to adhere to the belief, which they may at one time have seriously entertained, that the Berlin Conference delivered a formal and final judgment. The members of the tribunal, who must be competent to interpret their own meaning, unanimously agree to M. ST.-HILAIRE's declaration that they confined themselves to a simple recommendation which could have no binding force until the assent of both Turkey and Greece was obtained. It may be plausibly argued that the measure was injudicious, irregular, and calculated to mislead; but combined Europe, if it makes a mistake, has the right and the power to correct it. There is reason to believe that at present all the Governments concur with France in a hearty desire to get rid of the controversy as soon as possible.

According to a report which may probably be well founded, some of the Powers are not disposed to maintain in negotiation the claims of Greece to Janina. It might have been supposed that the question had been fully considered by the Berlin Plenipotentiaries; but it now seems to be discovered that the Turkish Government has throughout been justified in its contention that the position was unnecessary for defence, and that it was favourably situated for aggression. The anxiety of the Greeks for the acquisition of Janina is compatible with the theory that the possession of the place might facilitate further acquisition of territory. It happens that the capability of the new frontier to be used for purposes of defence is not of primary importance. Greece possesses the great advantage of a practically indefensible title to any territory which it has once lawfully occupied. Another neighbour might possibly encroach and retaliate; but against Turkey Greece has a virtual guarantee in the disinclination of Europe to allow any enlargement of Mahometan dominion. If Janina were once ceded to Greece by treaty, Turkey must renounce all hope of recovering possession. It is true that another class of difficulties might arise if the Southern Albanians were disposed to assert their independence. They would be formidable enemies to a State which cannot permanently maintain a large military force. It is said that the town of Janina is essentially Greek in the language and character of the population; but the disposition of the neighbouring tribes has not been satisfactorily ascertained.

The Turkish Government, with characteristic adroitness, takes advantage of the warlike demonstrations of Athens to exhibit as a contrast its own peaceable disposition and its deference to the counsels of the Great Powers. The last Turkish Note professes willingness to agree to a cession of territory larger than that which was offered in the abortive negotiations with Greece; and it also proposes

a conference for the settlement of details which should include representatives of all the Powers and of the Porte, nothing being said of the participation of Greece. According to one rumour, some of the Governments are disposed to inquire as to the boundary which Turkey is prepared to concede; but it is unlikely that such a question would produce a definite answer; nor can it be supposed that so distinct an overture tending to a compromise would be hastily made. It may be confidently conjectured that the immediate object of the Porte is to conciliate the European Governments without pledging itself to any definite sacrifice. The proposed exclusion of Greece from the negotiations is a sufficient proof that the invitation to a Conference is not a final offer. It would appear that the late Ministerial changes at Constantinople, which have not extended to the office of Prime Minister, have no immediate effect on the foreign policy of the Empire. The SULTAN is, as on many former occasions, alarmed for his personal safety; but there are no means of knowing whether the alleged conspiracies are real or imaginary. The most acceptable solution of the present difficulty would probably, in the opinion of Turkish statesmen, be a single-handed contest with Greece in which victory could scarcely be doubtful. After a successful war the recommendations of the Berlin Congress and of the Conference would lose their force, and the Turkish Government would not only have humiliated a troublesome adversary, but have secured a considerable material advantage.

The Greek Ministry is ostensibly as resolute as ever, notwithstanding the remonstrances of all its allies, including the Government which is regarded as the special patron of Greece. It is even announced that the war will begin in two or three weeks; but, on the other hand, it is remarked that some of the levies are not yet called out. The Ministers are careful to explain that the delay is not owing to any change of policy, but to an insufficient supply of officers and of arms. Munitions of war may perhaps be procured in abundance, as the Government has succeeded in raising a considerable loan. Officers are less easily provided, especially as the Government has, with strange susceptibility, rejected offers of service from foreigners. Public opinion in Athens, as far as it displays itself, is unanimously favourable to war; but there are probably many dissentients who think it prudent not to encounter popular clamour. There is no doubt that the Government and the nation are genuinely and bitterly disappointed. In common with the rest of the world, they misconstrued the decision of the Conference of Berlin, which was both officious and rash if it was not intended to be operative. They were afterwards encouraged in their hopes by the naval demonstration, especially as the French Government had in the first instance stipulated that it should be employed in support of the claims of Greece. The English threat of a seizure of the Customs revenue, therefore, must have confirmed the conviction of the Greeks that they were backed by powerful supporters. Finally, an English Cabinet Minister announced in a public speech that, if the Greeks made war on Turkey, they would not be left alone. Foreigners may be excused for appreciating but imperfectly the reckless levity of a popular politician new to the restraints of office. Mr. COUMOUNDOUROU and his colleagues have had time and opportunity to correct their illusions. They have now the means of knowing that, though England and France would gladly see them in possession of Janina, neither Power will engage in war for the fulfilment of sentimental aspirations.

THE CHURCH CRISIS.

THE deeper ridicule with which the release of Mr. DALE and of Mr. ENRIGHT has covered the Public Worship Act and its abettors has concurred with the Archbishop of CANTERBURY's answer to the Dean of ST. PAUL's and his brother memorialists. The form which the reply assumes is that of the reaffirmation of a letter which the ARCHBISHOP wrote a short time since to Canon WILKINSON, and which had been published in the Church papers. Now, at least, there is a clear field for some better understanding between Churchmen, and this will remain unadulterated, we sincerely hope, by any favour for the misshapen abortion of legislation passed in 1874 which has, like some fairy changeling, perturbed and blighted the Church's respect-

able household, into which it surreptitiously crept. Peaceable and orderly Church people have at last been certified by the highest judicial authority that the turpitude of wearing the wrong dress at the altar is equal to—not indeed more flagrant, as the Church Association vainly imagined—yet certainly not a whit less heinous than the offence of opening a writ in the Crown Office which ought to have been opened in the Court of Queen's Bench. So instructed upon the length and breadth of ceremonial sin, we are now able to consider the troubles of the Church with something like a firm mental grasp of the postulates of legal morality, and an appreciation of the comparative guilt of various species of that wide and diversified deflection from right-doing known as law-breaking—ranging as it does from murder and arson, from houghing and Boycotting, down to putting on the forbidden dress, or opening the writ in the mistaken place.

The positions to which the ARCHBISHOP commits himself in his letter are that "there must be some exceptional difficulty in present arrangements"; that the clergymen who are, like the officials of our law courts, law-breakers (not that, so far as we can ascertain, the last-named persons have ever had to complain of exceptional difficulties) are—we mean the clergymen—"of otherwise unimpeachable character"; a fact which has "led to so strange a result," while the Metropolitan cannot "but respect the evident earnestness of many who are disturbed as to alleged grievances which attach to our present condition." The mainstay of the ARCHBISHOP's apology for any presumable inaction on the side of the Church authorities is that "a large and very influential Committee" of the Lower House of the Convocation of Canterbury was appointed in 1877 "to consider the constitutional relations between the authorities ecclesiastical and civil in this realm, and the best method whereby common action may be taken by them in matters affecting the Church," and that this Committee did not report till towards the close of the Session of 1879. This, of course, leaves unexplained the critical years between 1874 and 1877. But it is not fair to press the question in a chronological spirit. We can well understand and pardon the man whose thoughts have been somewhat perturbed between the summer of 1879 and the opening of 1881.

This report is, in the ARCHBISHOP's opinion, "exhaustive and most carefully drawn," and, as soon as the forms of Convocation allow of it, he proposes to call the attention of his brethren of the Upper House "to the information it contains and its suggestion for the improvement of our present laws." Nothing can be more reasonable, or within its own limits more satisfactory, than this promise. But, according as the person who considers the conclusion to which it binds its author approaches it with the mind of a statesman or of a polemic, so will he regard it either with increased or with mitigated satisfaction when he recollects who its author is. It comes from the pen of that most able and active administrator who rather less than seven years since brought very much trouble both upon himself and upon the Church, by neglecting to take Convocation into counsel when he embarked upon the root and branch innovations of the Public Worship Bill, and then when he had become conscious of the mistake by curtailing the legitimate opportunities of that body to give an exhaustive and careful consideration to questions as important in their permanent results as they were unexpected in their introduction.

For our own part, while unsaying nothing which we urged while the Public Worship Act was under consideration, we desire now to believe that the Archbishop of CANTERBURY has healthily profited by the experiences of the intervening years. It is not to be expected that one in his position should make a public confession of changed views. No more genuine evidence of matured thought can be tendered than promises such as those which were at first embodied in the letter to Canon WILKINSON, and which now serve in their authoritative second issue to fulfil a more public and important purpose as the twice thought over response to a memorial which is as weighty from its signatures as from its arguments.

We took occasion last week to point out how insufficiently the *Times* handled the memorial by treating it as merely a plea for toleration in regard to Ritual, and by overlooking the representation which it contains to the unsatisfactory condition of the ecclesiastical judicature. It may be said that the ARCHBISHOP's letter is similarly

deficient in the other direction. But it should not be forgotten that we cannot fully judge of it so long as we are ignorant of the communication in answer to which it was originally written. It does, however, contain general expressions of sympathy clearly-referable to the ceremonial trouble, and no one can blame the ARCHBISHOP for preferring to reissue what was clearly a careful expression of policy rather than again travel over similar topics with a merely colourable difference of expression.

We have never lost the opportunity of dwelling upon the exceptional difficulties which surround any ecclesiastical arrangement, owing to the composition and temper of Parliament. We urged caution while the Parliament of 1874 was sitting, and the apparition of that of 1880 is not calculated to make us more rash. But, there is another consideration which we have with equal instance urged. All who are not fettered by red-tape ought to be able to appreciate that much can be done of which Parliament need not be apprised, and which, falling short as it may do of ideal, and therefore impossible, perfection, may yet be sufficient to calm perturbed minds. This is the comfort which is reserved for those who know how to wait—that is, to the men to whom, as a shrewd politician said, the world will at last come. It is to those in whose vocabulary wariness does not exclude condonation that we commend the ARCHBISHOP'S concluding promise that, “so far as I have any influence, the first work to which the bishops will be called in Convocation shall be a calm and thorough investigation of their grievances.”

SOUTH AFRICAN AFFAIRS.

MR. GLADSTONE'S reply to a memorial presented to him by a Dutch Peace Society is judiciously short, and yet it is imprudently offensive. It may have been right to return a courteous answer to an officious communication, but it was unnecessary to assure a set of philanthropic Dutchmen that the decision of the Government would probably satisfy their wishes. Not for the first time, Mr. GLADSTONE shows himself too ready to compromise grave public interests for the gratification of sentimental impulses. It is surprising that he should have learned nothing from the use which the enemies of society have made of his thoughtless rhetorical flourishes about the Manchester murders, the Clerkenwell explosion, and the fatal effects attributed to Irish evictions. A settlement which would please the Peace Society would include the concession of the demands of the Boers and a retraction of all the formal declarations hitherto made by the Government. The foreign sympathizers with rebellion might not unreasonably be accused of impertinence in criticizing the policy of annexation; but they estimated justly the disposition of the only conspicuous statesmen whom they would have ventured to address in similar language. It may hereafter become a practical question whether the barren sovereignty of the Transvaal shall be maintained or surrendered; but the only parties to the discussion must be the English Government, the insurgents, and perhaps to some extent the Cape Colony. Even Mr. GLADSTONE will scarcely show equal condescension to another Association in Holland which is formed for the purpose of assisting the insurgents with men and money. Sir C. DILKE was able to state, in answer to an indiscreet question, that no foreign Government has been guilty of the rudeness of making representations in favour of the insurgents. The Peace Society is less scrupulous and less responsible; but it had no legitimate excuse for interference. It is not impossible that Mr. GLADSTONE'S reply to Mr. RICHARD may cause the prolongation of the war by encouraging the Boers to resistance. The Government probably knows by this time that the firm language of the QUEEN'S Speech had produced a salutary effect in the Transvaal.

The Government of the Orange Free State seems hitherto to have given no cause of complaint; for it is not surprising that the territory of the Republic should be closed against English troops. If the prohibition applies also to the Transvaal insurgents, there will be no just cause of complaint. It is probably difficult or impossible to prevent private adventurers from joining the Boers; but as volunteers will have nothing to gain by engaging in a foreign quarrel, there is no reason to fear that the rebels will be largely reinforced from the Free State. It is stated that Mr. BRAND has informed the rebel leaders that the time for

mediation is passed; and that his Government will remain neutral in the war. In almost all the correspondence from the Cape it is stated that the Dutch of the colony sympathize warmly with the Transvaal insurgents; but probably those who take an active part in the agitation are hastily assumed to represent the entire community. The English colonists may be relied upon to wish well to the Imperial Government, and there seems to be no change in the position of political parties at Cape Town. Mr. SPRUGG continues to enjoy the confidence of the majority in the Legislature and probably in the constituencies. The present Colonial Ministry has always favoured the federal union of the South African provinces; and it is not likely to approve either of separation or of civil war. The campaign in Basutoland is proceeding prosperously; but a strange and untoward event has lately occurred. In the middle of a battle with a force of 5,000 natives, 950 burghers, principally, and perhaps wholly, Dutchmen, were said to have deserted, apparently in pursuance of a previous determination. According to a later version of the story, the burghers simply ran away. Colonel CARINGTON continued to combat, and won a decisive victory. It was supposed that the treacherous abandonment by his Dutch troops of their comrades had some connexion with the dispute in the Transvaal; but if the flight of the burghers was the result of design, the deserters did the worst possible service to their supposed friends and allies. The Dutch portion of the colony, whatever may be its opinions on the Transvaal revolt, is thoroughly bent on the prosecution of the native war. The desertion was an act of bad faith not to the Imperial Government, but to the colony. If it were understood that the insurgents in the Transvaal were allied with the Basutos or the Pondos, the cause of the Boers would be unanimously repudiated by the colonists.

The unprofitable controversy on the constitutional right of the Basutos is still feebly continued with little result in attracting public attention. In the short conversation on the subject Sir HENRY HOLLAND and Mr. GRANT DUFF accurately explained the position of the Government. In answer to a complaint of M. MABILLE, a French missionary, Sir HENRY BARKLY has admitted the charge that the Basutos received no formal notice of the arrangement by which they became subject to the jurisdiction of the Cape. As the ex-Governor says, they would have been incapable of understanding the transaction, and it would have been both idle and irregular to ask their assent. The dispute has ceased to possess any practical importance, for it is impossible that the Imperial Government should hereafter resume the administration of a territory which the colonists are with its passive assent now engaged in reconquering. It may be true that the Crown is likely to be more impartial and perhaps more benevolent to native subjects than a colonial Legislature and Ministry; but from the time at which Basutoland was included in the limits of the Cape the local Parliament became irrevocably supreme in the district. The colony has not hitherto been justly liable to the charge of maltreating or oppressing natives. Those who are settled within the colony, as long as they are peaceable and obedient, enjoy all the rights of their civilized neighbours. It is a proof of good sense that the franchise has been so defined as to render it impossible for native voters to exercise any considerable influence; but those Caffres who are sufficiently prosperous and civilized to satisfy the prescribed conditions have an undisputed right to vote. The same privileges may perhaps not be at once extended to the Basutos when their rebellion is suppressed; but all parties at the Cape understand that it is better to conciliate the natives than to rely permanently on superior force. The disarmament, though it seems to have been ill timed, was a measure in itself essentially just.

Even if the Imperial Government could in any circumstances have interfered between the colonial authorities and the Basutos, its attention would now have been unavoidably diverted to the more pressing difficulty in the Transvaal. A more embarrassing quarrel has never perplexed an unwilling Government. Intelligence is slow in arriving, and probably the Colonial Office is still imperfectly informed of the immediate causes of the insurrection and of its progress. According to some reports, the leaders of the revolt now deny that they were the first to commence hostilities; and it is possible that the rebellion may have originated in an armed enforcement of the law. Sir OWEN LANTON, who is accused of violence, is

an able and experienced public servant, and he is unlikely to have used force except for the purpose of overcoming illegal resistance. If an English officer opposed by force an attempt to take down the QUEEN'S flag, he was not the aggressor. The absurd account of the origin of the struggle, and of the fight at Bronker's Spruit, which is said to be contained in a proclamation of the Boer triumvirate, may possibly impose on some of their own party. It is not certain that this party is unanimous; but those who are favourable to the English will, if they exist, have an opportunity of proving their allegiance. It is an unprofitable exercise of ingenuity to guess at events which will soon be accurately known; but an attempt on the part of the insurgents to excuse their action may possibly be an indication of conscious weakness. There is no ground for hope that the struggle will be suspended. The rebels have occupied some additional posts, and the siege of the fort at Pretoria continues. There was reason to apprehend that it might become necessary to bombard the adjacent town, which is in the occupation of the Boers. Sir OWEN LANTON will certainly be unwilling to take measures which will aggravate the ill-will already prevailing; but all other considerations must give way to the duty of defending a fort which protects not only the garrison, but the English residents, with their wives and families. If the political embarrassment arising from the revolt cannot be at present surmounted, a final decision may be advantageously postponed. The first duty of the Government is to convince the insurgents that they have no chance of ultimate success in the field. It appears that reinforcements from England and from India have been despatched with commendable alacrity. Sir GEORGE COLLEY is probably by this time approaching the seat of war, and Sir EVELYN WOOD, who will be second in command, is on his way to Natal. The Boers are, in some respects, formidable enemies, as they are all mounted, and as they command the resources of the country. It is said that many of them have sent their families to distant parts of the province or across the border into the Free State; so that they will themselves be able to take the field without anxiety. On the other hand, it is believed that a minority among themselves disapprove of the revolt, and are coerced into taking part in the campaign. The Boers have no artillery, and little discipline, though they are familiar by experience or tradition with the practices of local warfare. In their last military operations against SECOCOENI the Boer levies were so inefficient as to incur the ridicule of their native allies, on whom they devolved the most dangerous service. Nevertheless it would not be safe to attribute a want of courage to a community which, though it is of mixed origin, derives its language and its character from Holland. It is to be wished, though scarcely to be hoped, that the impending contest may be of short duration.

THE LANCASHIRE COAL STRIKE.

STRIKES are rarely other than unsatisfactory things alike in their beginning and their end, and the colliery strike in Lancashire is no exception to the rule. At the end of last week some fifty thousand colliers in South and West Lancashire were "playing." At the present season, and with the present weather, any stoppage in the supply of coal is a serious matter, and nowhere could this be more serious than in Lancashire. About one-eighth of the total coal raised in the United Kingdom is derived from this single county, and the demand for coal in the district is probably quite proportionate to the supply. The coal-owners in the neighbouring coal-fields have already profited largely by the strike. The stoppage of machinery involves so much loss in various ways that a very large advance of price has been willingly paid rather than that the furnaces should be suffered to go out. In several of the Lancashire towns there was for several days a genuine panic on the part even of private consumers. Trade was almost suspended because every kind of vehicle was at work, either carrying coal or waiting for coal to be carried. Cladders and refuse of all kinds were bought by those who could not pay the price asked for coal. In short, the strike has had its full share of sensational incidents, and the authors of the excitement have doubtless seen with much enjoyment the natural consequences of their act.

The Lancashire colliery strike is an eminent instance of

faults, or, at all events, misfortunes, on both sides. In the first instance, the masters mismanaged matters. They contrived to convey, both to the men and the public, a conviction that they had made a demand which they afterwards declared they had never meant to make. Just when negotiations of a somewhat strained kind were going on about a rise of wages, a misunderstanding arose about the Employers' Liability Act. The masters proposed that the men should contract themselves out of the Act, upon the understanding that the masters would raise their contributions to the Miners' Relief Society from fifteen per cent., at which it has hitherto stood, to twenty-five, or, if necessary, thirty per cent. The miners' agent at Wigan, Mr. W. PICARD, advised the men to accept this offer. Whether this advice was good or bad was plainly a question for the men to determine for themselves. The law secures them certain advantages upon the happening of certain contingencies; the proposal of the masters secured them certain advantages on the happening of certain other contingencies. Whether the law or the contract offered them most can only be ascertained by those who are practically familiar with the condition of the particular industry. It happened unfortunately that the masters in making this offer to the men managed to persuade them that the option offered was not between employment under the new Act and employment on the terms proposed by the masters, but between employment on the terms proposed by the masters and no employment at all. The condition of continuing to work in the Lancashire collieries would be to forego the benefits secured by the Act. If the men were willing to make this contract, the employers would pay in return the increased contribution to the Relief Society. If the men refused to forego the benefits of the Act, the employers would find other workmen more to their mind. Had this been the real state of the case, the action of the masters would have been exceedingly injudicious. When a law has been passed giving workmen of all classes certain specified benefits, the masters are probably doing what is best, alike for themselves and the men, when they tempt them to contract themselves out of the Act by the offer of great advantages. But to make the acceptance of this offer compulsory, to insist that the workmen shall contract themselves out of the Act on the very day that it comes into operation, without even waiting until its meaning has been settled by legal decisions, would be little short of a deliberate challenge to the workmen to try conclusions. If the workmen had had their way, they would probably have been forbidden by the Legislature to contract themselves out of the Act, and to insist upon their doing so whether they liked it or not would have been the best way possible to start a similar agitation once more.

Fortunately the colliery owners in Lancashire had no such intention. As soon as the cause of the strike was made known, a large number of them met at Liverpool and passed a resolution disclaiming all idea of coercing their men into contracting themselves out of the Act, and declaring that, if the men do not wish to work under the new arrangement proposed by the masters, the latter have no objection to their refusing to do so, it being understood that, in that case, the masters will not hold themselves bound to continue their contributions to the Relief Society. Here, therefore, the strike ought to have ended. The employers had explained their attitude in a way which removed any necessary antagonism between themselves and the men, and it only remained for the men to consider whether the Act or the twenty-five per cent. contribution promised to do most for them. Instead of this, they appear to have thought that, as they were actually on strike, it would be convenient to settle two other questions upon which they and the masters were at issue. The men think that the time has come for a rise in wages; and they further ask that the wages may be paid weekly instead of fortnightly. The employers reply to the first request, that, though times are better, the improvement has not lasted long enough to enable them to recoup their losses; and to the second, that weekly payments are more costly. Whether profits have yet risen to a point at which the coalowners, looking at all the circumstances of their position, can afford to concede a farther rise in wages, is a matter on which it is impossible to have an opinion. Probably the demand has been granted by some employers and refused by others, something depends on the circumstances of individual owners. As regards the weekly payment of wages, we are inclined to think that

the advantage to the men would in many instances be shared by the masters. There can be little doubt that the possession of a relatively large sum of money is a temptation to spend it recklessly, and the week following upon pay-day is admittedly very much broken into by the debauch in which a large portion of the money is spent. It may be objected that if pay came every week, every week would similarly be broken into, and of the old hands this might often be true. But there is an improvement visible in this respect even among colliers, and the general experience of working-men seems to be that frequent payment of wages tends to promote regular payment of debts and to rescue a larger share of the money for the wife and family. This is a point upon which the masters might usefully confer with the more respectable men, and be governed by their opinions. As regards the whole subject of wages, there can be no doubt that, if the proper basis of a sliding scale could be fixed, this method of determining the rate to be paid would have conspicuous advantages. At one time the masters were decidedly opposed to its adoption, and an unsuccessful strike ten years ago was directed to extorting it from them. The employers who met at Liverpool last week declared themselves willing to consider the question again, and a joint committee of masters and men was appointed to consider how a sliding scale could best be adopted. It is plain that everything depends on the point from which the scale is to start; but there is no obvious reason why a committee thoroughly acquainted with the circumstances of the trade should not be able to settle this to the satisfaction of both parties. There is one feature in the present strike which cannot be too much blamed, or too severely dealt with by the local magistrates. There have been several isolated acts of violence, and a not infrequent disposition to levy "assistance" from the shopkeepers of the Lancashire towns. This latter practice has actually been defended on the plea that the men must live, and that it is better to live upon charity than to live upon the rates. The sooner the magistrates impress upon these reasoners that, if a man will not work, neither shall he eat, unless he or his fellows can provide the means, the better it will be for the future conduct of strikes.

THE ROYAL VISIT TO SICILY.

THE King and Queen of ITALY, with their son the Prince of NAPLES, and the KING's brother, the Duke of AOSTA, have been paying a visit to Sicily, and have met with a welcome so fervent and so general as to have somewhat surprised even those who are accustomed to the acclamations with which royalty is everywhere received in United Italy. Everything combined to give brilliancy to the visit, except the weather. Even that, however, had the advantage of stimulating the general enthusiasm. The sea was so rough that the commander of the *Roma*, which took the royal party from Naples to Palermo, telegraphed to ask whether their Majesties would really start. The QUEEN pencilled her reply on a scrap of paper, "Savoy always goes forward," and thus justified beforehand the tributes that were paid when she arrived to her own personal merits and charms and the gallantry of her ancient family. Palermo was beside itself with ecstasy when it at last got its guests in its midst. Delighted crowds watched the progress of the Sovereigns to the Cathedral, greeted them on their exit, and were enthralled with the dumb show with which Royalty recognized their enthusiasm. Every house was decorated, every street was illuminated at night. No soldiers were on guard, or at least none were to be seen, for the people kept order themselves. It is not very long since, on a similar occasion at Naples, an attempt was made to assassinate the KING, and thus the undertaking of the people that faithful guard should be kept by it had more than the customary meaning. Nor was the welcome confined to Palermo. Wherever the Sovereigns showed themselves they were received with the same exuberance of loyalty. There was no difference of feeling in different ranks; high or low, rich or poor, all felt, or seemed to feel, alike. But what was much more noticeable than this ardour of the laity was the equal ardour of the clergy. The hostility of the Vatican to the representative of the usurper of the sacred territory does not appear to have penetrated into Sicily. The KING was received at the Cathedral of Palermo by the Archbishop and a large body

of ecclesiastical dignitaries, and, what seems even more strange, some of these ecclesiastics wore the order of the Crown of Italy. When a day or two afterwards the KING visited the Cathedral of Monreale to examine its curious mosaics, he was welcomed by two Archbishops, who themselves did the honours of the local curiosities. The Church in Sicily has always in minor matters maintained a sort of independence of Rome, and could venture perhaps with more ease than could be done on the mainland to treat its Sovereign as if the quarrel of his dynasty with the Pope had never occurred. It was, too, no doubt pleasant for Archbishops to fall in with the humour of the people and to join in a welcome which they could not prevent. There is apparently no healing of the division between Church and State in Italy, and what happened at Palermo may be regarded as a local episode in a painful history. Still the KING and QUEEN may have enjoyed this happy reign of cordiality all the more because it was temporary and exceptional.

It is now ten years since the KING and QUEEN visited Sicily as the Prince and Princess of Piedmont. When they were then at Palermo the connexion between Sicily and the dynasty of Savoy was only ten years old. It has now lasted twenty years, and it is something to hear that the Sicilians like it better the longer it lasts. Probably Sicily itself has improved in the last ten years. It may not have improved much, but still it has more of orderly and efficient government than it used to have. The only occasion on which its affairs have excited much attention during the last ten years was when the Italian Parliament was asked to give the Government special powers to put down the Sicilian form of brigandage or league of brigands known as the Mafia. In 1874 the then Premier, MINICOTTI, gave his constituents at Legnano a sketch of the state of Sicily, which might, with some few necessary changes, be taken as a faithful description of Ireland at present. He spoke of crimes of bloodshed and plunder and of an audacity beyond belief, and then went on to say that the timidity of honest persons was becoming such that they had no longer the power of offering resistance. Witnesses could not be found, jurymen refused to act, the magistrates themselves were intimidated. The landowner could not visit his estates, dwellers in towns were no longer free agents; everywhere the violators of the law had their local ministers, who spread the terror and carried it to the most remote districts. The existing laws were not able to cope with the evil, and the Premier announced that the consent of Parliament to exceptional measures must be asked. The Government, however, was not very strong, and delayed its application to Parliament. But, meanwhile, it ventured on acts which must have gone beyond the usual boundaries of law. It made two sweeps on the most notorious offenders, and at one time carried off fifty, and another time eighty, malefactors to the islands on the Sicilian coast. In the next year—1875—it applied for and obtained, though not without great difficulty, the necessary Parliamentary powers. Troops had been poured into Sicily, and more were ready to be sent; but the Prefect of Palermo plainly told the Ministry that he could not put down the Mafia with the whole Italian army so long as the brigands could claim constitutional rights. Trial by jury, in fact, naturally broke down when jurors who had ventured to give a conscientious verdict were strangled or seriously wounded. But not only did the adversaries of the Sicilian Coercion Bill assure their friends that it was worthy of the Middle Ages or the most cruel despotism, but they boldly turned the tables on the champions of order, and asserted that the brigandage was the work of the police. We shall probably in the next few days or weeks hear a repetition both of the general assertion and of the special accusation when Irish anarchy comes to be seriously discussed in Parliament.

The remedy of force was tried in Sicily, and with considerable effect. But it is a very difficult thing to extirpate such an evil as brigandage, which the habit of centuries has ingrained into the manners of the people. After the new measure had been, for more than a year in operation, the notorious case of Mr. Ross, an Englishman who was carried off, and only released after payment of a heavy ransom, showed how active and undaunted Sicilian brigands still were. Even now it would probably be very unsafe to go without ample protection many miles beyond the limits of Palermo. At Naples, too, where precisely the same kind of evil has existed from time immemorial, there has recently been an alarm-

ing recrudescence of brigandage. There the evil was fomented or connived at by the sovereigns of the fallen dynasty, who had the peculiarity of being bad, not here or there, but all round and in every direction. They wished to be popular; and, as they had convinced themselves that the brigands were really their leading and most influential subjects, they showed tenderness in the quarter where they thought tenderness would pay best. It is at least satisfactory to find that the popularity of the head of a new dynasty, which has waged to the best of its powers unceasing war on brigandage, is greater at Palermo than that ever bestowed on a royal friend of brigands. Decent people, and in every country there are decent people, really like rulers who protect them better than those who do not, even though the rulers have been obliged to have recourse to measures worthy of the Middle Ages or of the most cruel despotism, or, in less ambitious language, have temporarily dispensed with the machinery of intimidated juries. The remedial measures with which the Italian Parliament has accompanied or followed the introduction of coercive measures mainly consist in giving subvention to help the construction of roads and railways. But Sicily is a difficult country to open up. All, or almost all, the towns are on the coast, and railways which go from one centre of population to another only skirt the island, and are made expensive by the necessity of going from one rocky place to another. Roads to the interior have almost everywhere to be made, and an island which used to be the granary of Rome is now probably not cultivated up to the limit of one-tenth of its capabilities. Much as Ireland and Sicily in some respects resemble each other, they differ as widely in other respects. Sicily has two great advantages—its immense superiority of natural resources and the absence of any political hostility to the governing country. Far from wishing for separation, the greatest triumph Sicily can obtain is won when a Sicilian is allowed to enter the Cabinet. On the other hand, Ireland is far more opened up, and much better cultivated. Sicilian brigandage is a much worse evil, because more persistent and universal, than anything we have to deplore in Ireland. England has done many bad things to Ireland, but it never left it entirely to itself as the BOURBONS left Sicily. Ireland is, on the whole, much forwarder than Sicily, and therefore it may be expected that firm and just government will tell on it more rapidly.

MOSCOW IN LONDON.

TO have lived in London on Tuesday, the 18th January, 1881, and to have survived the experience, is something which any man is justified in remembering, and which ought to justify occasional boasting of the fact. In old days there have been of course freezings of the Thames, roasted oxen, and other things of that sort. But even the most vigorous opponents of the theory that old-fashioned winters have gone out have to go back a quarter of a century before they can find anything to match the experiences of last Tuesday, and even the most fanatical admirers of an old-fashioned winter admit that they have had their wish "and a plague with it." For a week before the 18th, London, and more or less the whole of England, had suffered from, or rejoiced in, sufficiently hard weather. Skates had been got out, domestics had been reduced to small fragments by the combined operations of the water Companies and the makers of improved grates, water had been a thing to fetch from that very unpoetical analogue of the Eastern village well—the stand-pipe. But winter in his roughest mood never—at least in London, and within the memory of middle-aged man—imagined anything like last Tuesday. Heavy snowfalls always strike the business, and to a less degree the amusements, of this city with a temporary paralysis. But the mere snowfall of Tuesday was the very least of its tricks and manners. Seldom, indeed, has a greater quantity of the very pretty and very troublesome commodity in which Kings of Siam disbelieve fallen in a short time. But snow without wind is comparatively manageable. Snow with wind, and especially with such a wind as that of Tuesday, is frankly unmanageable. At an early period of the day, and in comparatively sheltered streets, considerable discomfort, occasional breathlessness, frequent scudding before the wind with a shameful regardlessness of the proper course in which the scudder's steps

ought to be directed, and hair and beards full of icicles, summed up the dangers to which men and women who unwisely left their firesides were exposed. But later in the morning, and about midday, when the snow had fallen in considerable quantities, and had been drifted by the wind into deep banks, while the wind itself still continued, the state of things was aggravated infinitely. Matters became acute about noon, and from that time till the wind dropped at sunset the crisis continued.

It is not a very great distance from Queen Anne's Gate to Marlborough House, and the few hundred yards which lie between these two points may usually be passed over by the walker without his encountering any obstacle greater than the possibly obtrusive legs of some loafing admirer of the ducks on the bridge. A thought of the pleasant old days, when that bridge was not, and when a ferry did the duty, is the only other thing likely to disturb the consciousness of a meditative or occupied person. But on Tuesday a journey from Queen Anne's Gate to Marlborough House was a thing to be remembered. It was in this respect like a journey through the Valley of the Shadow of Death, that the traveller was not troubled with companions. If he thought of the ferry at all, it was with a devout expression of thankfulness that it was no longer necessary to trust to it. Between the northern end of the bridge and the gate into the Mall the snow lay literally thigh-deep, while the easterly gusts poured down from Sir GILBERT SCOTT'S structure on the right in a way which made pedestrians rather thankful for the snow as a kind of steadier against it. In some places, even in this comparatively sheltered situation, there was nothing to do but to turn face or back to the *tourmente* and let it blow itself out before attempting to go on. The storm must have, at any rate, served intelligent students of comparative clothes-learning with an important opportunity for arriving at conclusions likely to be useful in future. Ulsters, especially of a hairy and fluffy make, simply became snow-traps, while mackintoshes of a strait conformation, a stout texture, and a smooth surface did wonders. The piratical vessel in the ballad was "brass within and steel without." A person who should be condemned to dwell perpetually in an atmosphere similar to that of Tuesday should be fur within and mackintosh without if he wishes to laugh at the weather, which in the course of time, and after much acclimatization, he might possibly do.

It is only fair to say that the hackneyed complaints about municipal unreadiness in dealing with the snow hardly deserve repetition on this occasion. The treacherous drift of Tuesday would have prevented even that impossible million of carts which the London grumbler desiderates from carrying off the shifty avalanche which descended upon us, and by a reasonable time on Wednesday most of the principal thoroughfares were passable, at least on foot. How to make them passable in any other way on such occasions is a problem which would probably tax a good many of those who grumble at the absence of a solution. In wide roads the matter is not difficult, because the snow can be banked up at the sides as it has very generally been banked up during the last few days. But in narrow ones, such as unfortunately abound in London, this is hardly possible, while the bodily abduction of the snow has often been shown to be a simple impossibility. Hence, as usual in such circumstances, vehicles in London during the middle of the present week were conspicuously few. Omnibuses ceased to be after midday on Tuesday; cabs were not to be had for love at all, nor without a considerable expenditure of money; and the hansom with leaders once more made its appearance. It is a proof of the wisdom that comes with experience that the modern hansom leader is usually postilioned. When some fifteen years ago the idea first struck enterprising cabmen, terrible sights used to be seen as a consequence of the inability of the drivers to drive tandem, and the disinclination of the steeds to be so driven. A leader calmly descending area steps with a driver in vain endeavouring to correct him, and a weeping fare of the weaker sex appealing to high heaven and the bystanders, is too harrowing a spectacle to be permitted. Sleighs, too, have made their appearance in some numbers, and the perfect crispness and dryness which characterized the snow suited them admirably. Indeed, the most remarkable thing about this present frost has been its singular steadiness and consistency. For at least ten days it has never condescended to the slightest thaw. Hence, except inside the house, the sufferings experienced

have been perhaps somewhat less than they are in those periods of misery when sloppy slush surmounting frozen snow, and fresh fallen snow surmounting sloppy slush, furnish the London pedestrian with his alternatives. Inside the house sufferings have indeed not been small. We do not now speak of those unspeakably unfortunate inhabitants of Lambeth for whom well-deserved assistance is asked, and who saw and felt their houses invaded by deluges of filthy and half-frozen river water on Tuesday. The grievance of the happier and more well-to-do Londoner is not that his house is invaded by water, but that water sternly refuses to enter it on any terms, friendly or hostile. The HOME SECRETARY, as we all know, is going to do wonders with the London water supply, and the first wonder to the production of which it may be hoped he will direct his mind is the devising of some means whereby those who pay for water shall not need to pay for it during indefinite periods twice over, and to have to fetch it at their own risk and trouble as well. It is true that the London builder is in that matter as guilty as the London Water Company, and perhaps the only remedy would be the Constantinopolitan one of hanging a Water Company and a score or so of builders every severe winter. A less soluble difficulty is presented by the want of milk, which effectually prevents a plagiarism of the famous suggestion that, in default of bread, cake might make a pleasant, wholesome, and nourishing diet for the lower orders. Blocked trains have stopped the London milk supply, and the few surviving suburban dairymen must be driving a roaring trade and rubbing their hands over the temporary downfall of their supplanters. So that, on the whole, it would be scarcely correct to say that the present season is a wholly delightful one even for people who have no actual want to dread, like the more hapless beings who are pleaded for at this season. There is, to recur to our starting-point, a fearful joy in having been out on Tuesday and in having continued to live. Farsighted people may also reflect that such of us as survive and are favoured by fortune will probably drink good wine about twelve or fifteen years hence, for a sharp winter is usually, if not always, followed by a hot summer. This, however, is philosophy, and philosophy cannot be expected of everybody. What may be expected of everybody is a desire for a thaw, mixed with a fear of the period of briefer, but almost sharper, misery which that thaw will usher in.

FRENCH ELECTIONS.

THE complementary elections of Sunday were remarkable for the entire defeat of the Communists. The new municipal Council is substantially the old one over again. Those who wish to see a rational Conservatism predominant in French administration, whether national or local, will not derive much comfort from this fact. It is something, no doubt, to know that the care of the public buildings of Paris will not devolve upon the gentlemen who burnt them in 1871, and that the Republican troops will not again have to besiege the capital of the Republic. But the Council, which by comparison with the Communists we are forced to call moderate, is the Council which has been responsible for the many petty acts of tyranny which have lately been committed in Paris. It is the Council which has secularized the schools, driven Sisters of Charity out of the hospitals, pulled down religious emblems, and given a new name to so many Paris streets. It is, and glories in being, a thoroughly Radical Council. Nor is the defeat of the Communists at all likely to make it less Radical. That defeat will relieve both the Council and its constituents of the only fear to which they seem subject—the fear of another Communist outbreak. The most extreme Radical is inclined to become Conservative when he is afraid of having his house burnt over his head by a more pronounced Radical than himself. When that fear is removed he feels once more free to consult his own fancies. What these fancies are is abundantly shown by recent Republican legislation. The rule with the party now in power is, when in doubt attack religion, and up to this time the results seem to have justified their choice of a maxim. Schisms in the Republican ranks have more than once been healed by this convenient device, and none of any importance has been created. The Church turns out to have no friends, and it receives the treatment which is popularly appropriated to institutions in that helpless condition.

The Session which began on Thursday does not promise to be a very eventful one. At least this would be true if it were not said of a Legislature which has been singularly fertile in surprises. It is the last Session of the present Chamber, and Legislatures are seldom very active on the eve of their dissolution. They have not time to make a new character, and they may easily lose what character they have already made. One question, however, the Chamber of Deputies can scarcely avoid debating. The eve of a general election is an inappropriate time for many things; but it cannot be called inappropriate for considering how the votes of the electors are to be given. The substitution of the *Scrutin de liste* for the *Scrutin d'arrondissement* has the obvious advantage that it will increase the Republican majority. The *arrondissements* which now return Conservative deputies will in many cases be swamped when the voting goes by departments. But then, in order to secure this party triumph, both deputies and electors are asked to make a heavy sacrifice. Under the *Scrutin d'arrondissement* local claims are ordinarily paramount. Here and there a man of unusual mark finds a seat out of his *arrondissement*; but the majority of the deputies are returned by people who know something about them. If the department becomes the electoral unit, local knowledge must go for very much less. Candidates will seldom be famous enough to be as much at home in their department as they have been in their *arrondissement*. It will be needful, therefore, to resort to some other means of recommending them to the electors; and there can be no doubt what this means will be. A Republican Committee, with branches in each department, will sit in Paris, and will arrange the list of candidates for the whole country. The object of a man who wishes to get into the Chamber will no longer be to recommend himself to a special constituency. The good will of the Committee will be the thing to secure, and in the majority of cases this will naturally be gained by men who live in Paris. The introduction of the *Scrutin de liste* will be the best news possible for barristers, journalists, or doctors who find politics a more interesting or more profitable pursuit than the dull and perhaps ill-paid routine of their own professions. If they can but make themselves known by speech or writing, they will have a chance of being sent down to some constituency stamped with the Republican hall-mark, and reasonably sure of being returned. But it will not be equally good news for the barristers, journalists and doctors whom the new arrivals from Paris will displace, and as it is to these last-mentioned classes that the present deputies largely belong, they are not specially anxious to bring in the new gospel. Whatever the *Scrutin de liste* may do for the party, it can only do harm to those with whom it rests to introduce it, and in this case the existing deputies may fairly plead that their skin is nearer to them than their coat. If the electors were known to wish for the change, the deputies might not care to let their views on this question appear. They would not do anything to secure their re-election, since the *Scrutin de liste* would be made a party test, and the fact of their having rejected it would certainly be used against them. But there is no reason to suppose that the electors are very well disposed to the *Scrutin de liste*. A voter in a small community is a more important person than a voter in a large community, and he has consequently nothing to gain by exchanging the former position for the latter. All experience goes to show that the average elector's interest in politics is keenest when it is circumscribed within a small area, and is stimulated by local associations and local hates. A country election in England is a much less exciting affair than a borough election, and under the *Scrutin de liste* every French election would, except in the very largest towns, be put upon the country level. Still, against all this there must be set another consideration of great and, it may be, overbalancing importance. M. GAMBETTA is known to wish for the *Scrutin de liste*, and what M. GAMBETTA is known to wish for, that, to all appearance, France wishes for. That M. GAMBETTA should be dissatisfied with the existing Chamber seems natural enough. He has helped, no doubt, to make it what it is; but that need not prevent him from disliking his own handiwork. Few deliberative assemblies have shown less capacity for giving steady support to the Government which, on the whole, they wish to keep in power, and when M. GAMBETTA takes office he will certainly want a Chamber which is prepared to give him a steady support. Why the *Scrutin d'arrondissement* should fail to yield such a

Chamber is not very clear, but upon this point M. GAMBETTA may be supposed to know his own business best. At all events, there is no doubt that he approves the change on this ground, and this circumstance may easily prove a determining element in the calculation. Whatever the electors may be doubtful about, they are clear as to the fact that they wish M. GAMBETTA to rule over them, and if they are led to think that the maintenance of the *Scrutin d'arrondissement* will in any way interfere with this result, they will probably wish to see the *Scrutin de liste* put in its place. In that case they will no doubt contrive to acquaint their representatives with their wishes, and the rejection of the *Scrutin de liste* can then only be brought about by a coalition between the Right and the Extreme Left; the one fighting for the constituencies that at present return them, the other caring little about the question actually in dispute, but being thoroughly determined to refuse M. GAMBETTA anything that he asks for.

The *Times* of Thursday contained an interesting letter, setting forth the reasons why, in a country not really disposed to revolution, revolutionary ideas find such ready acceptance in the Chamber and with the Government. The explanation is the same which has so often proved correct under widely different conditions. The great mass of the electors do not care about politics. They favour the Republic, but it is not for any genuinely political reasons. They have persuaded themselves, and on the whole with good reason, that the Republic means peace, and at present peace is the thing that they most care for. The impression made upon them by the last war was at first underrated, but in the judgment of competent observers of various politics, it is so deep and abiding that it will probably not wear out until the generation which witnessed the war has left the political field. This view has lately received a curious incidental confirmation. Some months ago M. GAMBETTA made a speech which was, rightly or wrongly, held to be decidedly warlike in tone. This was promptly followed by a decidedly pacific speech from M. DE FREYCINET. The latter probably thought that he saw an opportunity of asserting his independence of M. GAMBETTA by taking the popular line on a matter upon which the nation feels strongly. M. GAMBETTA proved to be too strongly entrenched in the affections of his countrymen to be dislodged at the first attack, and he succeeded in bringing about M. DE FREYCINET'S overthrow. But he showed at the same time that he had not been unobservant of the lesson. The attitude of France on the Greek question is probably due to M. GAMBETTA'S conviction that there is one trial which even his popularity would not stand, and that if he wishes to retain his influence unimpaired, he must avoid everything that savours of a warlike policy. But, though the electors are careless about politics, except so far as they minister to peace, the deputies cannot be equally careless. A legislative Assembly must legislate; indeed, if it ceased to do so, its constituents might begin to consider whether the deputies were worth their salary. The Government meets the desire for action on the part of the Chamber by introducing a variety of measures which have the double merit of pleasing the active minority among their supporters while not offending the passive majority. This is why such prominence has been given to ecclesiastical affairs. The mass of the nation cares nothing about the dispersion of the religious orders or the banishment of the priest from the communal school. It regards these measures as the recreation of its rulers, which are perfectly legitimate so long as they do not interfere with serious business. Provided that the Government abstain from war, and from anything likely to lead to war, it may amuse itself in any way it pleases. For themselves, the majority of the electors have more important things to think of. According to the letter in the *Times*, they have for the first time tasted the joys of speculation. Joint-stock Companies have not yet been found out in France, and the investor is still under the belief that there is no necessary incompatibility between high interest and good security. For the present, therefore, the electors have no time to think of anything except how to put out their money to the best advantage. By and by they will probably have no time to think of anything except how much has been lost in the process of putting it out. Either way their political indifference seems secured for some years to come.

PERPETUAL PENSIONS.

IT is not surprising that Mr. BRADLAUGH and Mr. BRADLAUGH'S constituents should be exercised on the subject of perpetual pensions. Considering that a good many such pensions have still to be paid, the people of Northampton have a certain right to make inquiries about them. Few Parliamentary papers are likely to be more read than the return which Mr. BRADLAUGH obtained on Monday. In the interval before its appearance the ignorant must be content to slake their curiosity with the contents of a leading article in Tuesday's *Standard*. There they will find how a representative of GEORGE III.'s household is still living, how a few pounds are still paid to persons who suffered from the Rebellion in Ireland in 1798, and how a compensation arising out of the concession of Florida to Spain was paid down to last year. These, however, are terminable curiosities. The annuities to which Mr. BRADLAUGH has called attention go on for ever. At one time it seems they were much more numerous than they are now. Of those that remain the *Standard* singles out the more prominent. The 4,000*l.* a year granted by WILLIAM III. to the Duke SCHOMBERG has for many years been divided between two distant relatives. A similar sum was voted to the descendants of WILLIAM PENN, and it is to be presumed that the right of some one to bear that character is still made out as pay-day comes round. Another 4,000*l.* a year reminds the Duke of MARLBOROUGH of the debt the country owes to his great ancestor, and a portion of the amount voted by Parliament to the brother of NELSON remains the property of his heirs. The Duke of GRAFTON perhaps wisely commuted in 1857 a large portion of the pension originally given to his ancestor, and the item of 255,777*l.* 13*s.* 2*d.* then paid over to him shows how excellent a security an entry in the pension list is. The Duke of RICHMOND and GORDON holds his annuity by a similar title. The 19,000*l.* a year about which Mr. BRADLAUGH asks particulars was given him by Parliament in the reign of GEORGE III., in consideration of his surrender of the right granted to his ancestor by CHARLES II. to draw one shilling per chaldron on all coal shipped in the Tyne for home consumption.

It is heartily to be wished that all the holders of perpetual pensions had followed the Duke of GRAFTON'S example. No kind of property appears to be held by a better title than a yearly grant of money which has in one form or another all the authority of an Act of Parliament, yet no kind of property is regarded with greater aversion by the enemies of property in general. Even the popular view of a pension regards it as something granted for a limited time, and when a perpetual pension is spoken of we suspect that it is commonly confounded with a pension perpetually renewed. If the Duke of RICHMOND and GORDON had had his right to tax Londoners' coals commuted for a sum of money, the affair would long ago have been forgotten. Even now nothing is asked about the 255,000*l.* which was paid to the Duke of GRAFTON three-and-twenty years ago. Is there anything so inconsistent with public policy in the substitution of an annuity for a payment of money down that can justify the application of different rules to the two benefits?

If perpetual pensions were still given, something might be said against their continued recognition on the score of public convenience. But perpetual pensions are not now granted. Any recognition of distinguished public services that Parliament may be moved to vote is limited to a generation or two. There is nothing therefore to prevent these pensions from being viewed with historical impartiality. Do they differ from other forms of property, or is the attack upon them to form part of a general movement against all property which has not been gained by the owner's labour? The form which Mr. BRADLAUGH gave to his motion is calculated to raise some suspicions on this score. He somewhat markedly went out of his way to show the solid foundation on which the titles he is impugning really rest. The return is to show "how many and which of the perpetual pensions are actually paid to other persons than the persons named as their recipients in the finance accounts, and in each such case to whom the said several pensions are really paid." Mr. BRADLAUGH certainly does not wish to strengthen the case in favour of pensions; and it must consequently be supposed that he thinks the fact that a pension has been assigned to another person somehow makes it easier for Parliament to deal adversely with it. As a matter of fact, of course the argument is entirely the

other way. Nothing can show more conclusively that these pensions are the property of those to whom Parliament has decreed that they shall be paid than the circumstance that they have been freely dealt with like any other property. The highest title that can be made to an estate is a Parliamentary title, and this is precisely the title by which the present recipients of these pensions hold them. Mr. BRADLAUGH will possibly contend that the right to withdraw them a century or two after they have been given is somehow involved in the omnipotence of Parliament. But in that case he must be prepared to go a good deal further, and to say that any Parliamentary title whatever may subsequently be defeated by Parliament itself. From this point of view a Parliamentary title becomes, not the best, but the worst, of titles. Instead of being equivalent to a deed or gift, it is only equivalent to a will with a perpetual power of revocation reserved to the testator's representatives.

It will be interesting to discover, as we doubtless shall by and by, what is the precise importance which Mr. BRADLAUGH attaches to a sale of those perpetual pensions. Supposing one of them to have been treated like any other annuity—to have been sold in the open market, and to be now received by a person who has paid full value for what he enjoys, how does Mr. BRADLAUGH propose to deal with him? The first impression conveyed by the terms of his motion is that the fact that the pension has been parted with for valuable consideration only adds to its merits. It is bad when it is held by the representatives of the man to whom it was originally granted, it is worse when it is held by the representatives of some one else. If this new attack upon property held, in the first instance, by a Parliamentary title, is to extend to all into whose hands such property shall come, the general sense of insecurity will be very great. It is possible, however, that Mr. BRADLAUGH has another object in view. He may have a greater tenderness for property which has passed from hand to hand by the ordinary process of sale and purchase than he has for property which has not thus purged itself of its original vice, and he may desire to separate the sheep from the goats before making the onslaught upon perpetual pensions generally, which he doubtless contemplates. In that case the popular ideas about property will be still further confused. A man must then be regarded as having a right to sell that which he has not a right to hold. The pensioner who has parted with his pension, and invested the proceeds, will enjoy in his own person, and be able to hand on to his descendants, a sum equivalent to that given to his ancestor a century or two centuries ago. The pensioner who has preferred to keep the pension in its first form will have to put up with the loss of it. Either way, some one must be punished for their reliance on Parliamentary good faith. If the pension is followed into the hands of purchasers, it is they who will suffer. If they are allowed to escape, it is the descendants of the grantees who will suffer.

The obvious moral to be drawn from Mr. BRADLAUGH's motion is that the sooner this kind of property is made to change its character the better alike for the holders and for the community. It will be well for the Government to be perfectly frank alike with itself and with those with whom it has to deal. Those are not times when it is expedient for property to have any weak points to be defended. It is pretty clear that the title of a good many persons to the goods they enjoy will in future be subjected to a very close scrutiny. Possession will lose several of those nine points on which it has hitherto relied. Those who wish to see this scrutiny successfully sustained will have some regard to the appearance of the title as well as to its real validity. Some kinds of property are more easily understood than others, and it may be admitted that perpetual pensions belong to the less intelligible class. To take them away may be an act of robbery, but it is an act of robbery which is perhaps more likely to be committed than most others, and as such it is one against which it is specially expedient to guard. The passion for abridging rights of property is a plant of remarkably fast growth in Radical bosoms, and a process beginning with perpetual pensions might go a good way further before it stopped. It is plainly the interest of the pensioner to take all these chances into account when calculating the capitalized value of his annuity, and it is equally the interest of the Government to get rid of an annual charge at a fair price. Under these circumstances it ought not to be difficult to strike a bargain which will be to the advantage of all concerned.

THE NEW FORTIFICATIONS OF PARIS.

TEN years have gone by since, yielding under pressure of imminent famine, the city of Paris, holding an enormous population, capitulated after four and a half months of rigorous blockade. Few here or elsewhere had credited that population with staunchness to endure even half the time. Yet, had food been procurable, Paris might have rivalled Saragossa in the fierce tenacity of its defence. The lower classes especially were full of fight to the last. The Germans would have forced a surrender only after days and weeks of carnage on successive barricades, in contests from house to house, cellar to roof. General Sherman was admitted into Paris during the siege, and on his return pronounced that capital to be "a madhouse inhabited by monkeys." But, monkeys or men, they held out till they had eaten up the city rats and mice, and the *habitants* of the Zoological Gardens. We are by no means persuaded that the Lord Mayor and aldermen of the City of London would be for holding out when "the voice of the turtle" was no longer "heard in the land," when the butcher's shops were hung only with the sombre hippopotamus, and when the poulterers dispensed barn-door rats in place of barn-door fowls. The French may be a nation singularly impulsive; but who will now deny them the virtue of restraint? On one subject, and that paramount in their thoughts, it has been virtually the almost unbroken silence of a proud, fierce, and mighty people for ten whole years.

The French nation has been at work since the morrow of defeat on the restoration of its dignity and power in the great camp into which Europe is fast resolving. We propose here to sketch what has been done for the defence of the capital; this is but one of many questions connected with the protection of the country which have been under resolution. After the war there was left only a fraction of an army, and that disorganized. The arsenals were emptied into Germany, whither thousands of cannon, and hundreds of thousands of rifles, and scores of millions of money, had gone also. The army is now France armed; the arsenals are full; the artillery has its full complement of the newest guns; there are a million of first-rate rifles for immediate use; the navy is most formidable; and the nation pays with cheerfulness enormous sums yearly to maintain its acquired power. A contrast this with what we see in Germany, which groans over what it has to pay for its position, and in England, where a large party cries victory over every petty dockyard economy!

After prolonged scientific investigation, the new system of defences for the capital was settled in its general, and nearly all its particular, features in 1874. With not so much secrecy as silence the ground was studied, sites were selected for the works, and during seven years stone by stone has been laid, till now the chain of defence is virtually completed. It is curious, as illustrating how tacitly unanimous the whole country was and is in its purpose, that, though the Germans knew perhaps every detail of the scheme, the French, even in Paris, were, as M. Ténot tells us in his interesting work *Les Fortifications de Paris* (Germer-Baillière et Cie.), generally ignorant of how matters were progressing.

Before going into details, let us glance at a preliminary question. Was it advisable to re-fortify Paris? If it was a mistake to fortify at all, is it not a double error to give it greater importance than ever—so much, indeed, that it is destined to become the rallying-point for the entire nation, and the certain objective of an enemy? Vienna is not fortified, no more is Berlin, St. Petersburg, Madrid, or, in any adequate fashion, Rome. Then why turn Paris into a fortress? Some German writers endeavour to prove that the French are committing a gigantic blunder. On the other hand, in this country it has been argued with better logic that an impregnable Paris would, in every probability, be the salvation of the country. It may be observed briefly that Paris is the heart of the nation in a sense different from that in which any other capital may be said to be the life of a country, with the single exception perhaps of London. It is possible the capture of London would paralyze the nation if it was the result of a sudden *coup* in the early days of a war. But Berlin, Moscow, Vienna, Madrid have been taken, and the several peoples have fought as stoutly after as before the event. Paris stands on a different footing. It is the centre towards which the whole sentiment of the nation inclines. During centuries of centralized administration the *mot d'ordre* went forth from the capital for the regulation of all matters, even the most trivial, in every hamlet in the kingdom. "Cette importance de Paris est la résultante d'un concours de forces historiques irrésistibles. Les Français contemporains," adds M. Ténot, "qui n'ont pas créés ces conditions, sont bien forcés de s'en accommoder." But besides considerations of a moral, sentimental, and traditional order which invest the French capital with exceptional importance in the national view, Paris is also an enormous prize from its wealth. In a strategic point of view the disadvantage of its proximity to the northern and eastern frontier is amply compensated, now that the capital has become a colossal arsenal, by the threatening position it assumes against an enemy advancing on the centre, west, and south of France. But really the question raised in 1840, and thoroughly discussed, as to the propriety and utility of fortifying the place received a practical answer in 1870. Had Paris been secure in 1814 Napoleon would perhaps have ended in repelling the Coalition; had it not been secure in 1870 the Germans would have swept over the whole land in irresistible power.

M. Thiers deserves every credit for his work of 1840. It amply fulfilled its purpose. Even the imbecility of the Imperial Government failed to give over Paris a prey to the enemy; and if Marshal MacMahon, following his first and best idea, had been permitted to concentrate on Paris the army of 110,000 men which was swallowed in the pit of Sedan, the siege would have been carried on under very different conditions.

It must be admitted, however, that the old fortifications, notably on the south side, once the enemy established on the surrounding higher ground, would not have held out indefinitely against regular approach. But these were created at a time when no one dreamed of artillery ranging with its present precision and power. Therefore, when the war was over, the question again came up as to how Paris might be efficiently protected. The old forts were situated at, on an average, from 2,000 to 2,200 yards from the bastioned *enceinte*. It was determined to construct an outer circle of new forts at distances of from 8,000 to 12,000 and even 18,000 yards from the city ramparts. Incidental advantages of immense value would accrue from placing those works at the farthest distance, always provided that the forts were of such capacity as to impose upon an assailant a siege *en règle*, near enough to each other to be able to combine cross-fire, and flanked and supported in rear by other works. An important advantage gained is that it would require an army three times more numerous than the Germans brought up against Paris in 1870 to shut the city in now as they did then. Another is that it will be more difficult to concentrate against sorties; and the easier for the besieged to select his point of exit, and to collect troops unperceived in the vast spaces within the circle. Another advantage is that a wide area of rich country, the resources of which were before available for the Germans, will now contribute to the maintenance of the city.

The situation of Paris is peculiar. It occupies the arena of a low amphitheatre, the modern parts overlapping the first *gradus*. Not too roughly speaking, all round the city and beyond the first elevations occurs a reach of level ground which is dominated by the second line of heights, higher, but nowhere of imposing altitude. It was on this line the Prussians established their batteries. Beyond it is mostly plain, with only accidental *maelotons* until we gain the third line of heights, which are higher again. Beyond these lies generally a vast and level area devoted to cultivation. The new forts hold the third line. By the aid of any good map the reader not acquainted with the localities can trace the old and new chains of defence, the inner and the outer circle. On the northern side St. Denis, formerly defended by a double crown-work only, and exposed to the full fury of the German fire, is now completely sheltered by a group of forts—Domont, Ecouen, in first; Montlignon, Montmorency, in second line; with flanking casemated batteries, on the plateau of Montmorency. This plateau, or terrace, is flat, having an abruptly scarped descent outwards; and the forts have uninterrupted command over a wide open space. Here we may allude to the method on which the new forts are generally constructed, and which differs essentially from that employed in 1840. Those who know Paris will remember the bastioned trace—curtains flanked by bastions forming a regular succession of salients and re-entrants, all in masonry work, having a deep fosse in front, and little elevation over the neighbouring ground. The new forts, on the contrary, have a striking relief, with wide view and command; unlike the old star forts, the line of ramparts has an almost circular polygonal regularity. "On ne distingue plus de bastions, rien qu'une crénelleure énorme formée par la succession des traverses épaisses qui protègent les pièces en batterie." Large casemated *caponnières* disposed at every angle, and flanking each the other, sweep the escarp, and the ditches which are generously deep. It is the system of the French engineer Montalambert, one that had hitherto found more favour in Germany than in France, but which has now been reproduced with improvements. The garrison is sheltered by casemates impervious to the most formidable projectile. In the larger forts there are 60 of the new rifled steel pieces of 155 millimètres, having at 8,000 yards a power and precision which the old smooth-bores could not equal at 2,000 yards. And the new fortifications allow of a great economy of *personnel*. It is calculated that the whole chain of exterior forts and batteries will not require more than 20,000 men for their perfect security. Under these conditions, with the defence thoroughly commanding the ground of approach to a great distance over open country, armed with an artillery which allows of two or more forts and batteries giving an effective cross-fire, it must become a most serious consideration for an assailant how he is to begin his work.

To the north-east, on the right bank of the Marne, at a distance of very nearly ten miles from the *enceinte*, and eight from the old forts in rear—Romainville, Noisy, Aubervilliers—is placed the fort of Vaujours. It is distant from the nearest defence on its left (Ecouen) as the crow flies no less than twelve miles; and on first thoughts it would seem as though it was a very large gap indeed to leave open—one over which no cross-fire could be effectively maintained. But, had it been deemed advisable, it was easy to throw up an intermediate obstacle. It has been purposely left open to an enemy adventurous enough to enter in. The fact is the new forts, and especially here, act as flanking bastions. An enemy venturing between them would find himself in front of the curtain formed by the old forts and *enceinte*, which are perfectly safe from a *coup de main*, while his flanks would be pounded from the new line. Moreover, the fort of Stain, half way between St. Denis and Ecouen, though not strong

enough to stand by itself, is so well flanked that it would lend material aid in the defence of this wide *trouée*, or gap. A learned German critic, who has done his best to find out the easiest road to the heart of Paris, having given his opinion that this is the weakest part of the French line, thus sums up concerning it:—"On the whole, then, we consider that *five or six forts must be taken, and three or four others silenced*, before an efficacious bombardment of Paris could be commenced." If, as M. Ténot justly observes, this is the weak point, what must be the strength of all the rest?

Continuing the round, Vaujours has easy cross-fire with Chelles, posted on a scarped hill above a narrow flat separating it from the Marne. An attack on this side would have small chance of success; for the capture of the above works would bring the assailant to the plateau of Romainville, the strongest and most defensible part of the old line. South-east of Paris lie the Marne valley and the rich plateaux of La Brie. Just as the northern plain between the Marne and Oise is one natural road for the advent of a great invasion from Germany, so also is the section between the Marne and Seine. By the latter way marched in 1814 the armies of the Coalition; and again, in 1870, the bulk of the force under the Crown Prince of Prussia. It is of the first necessity for a German army of blockade to establish itself in the country south of the Marne, since not only does its main line of communications traverse it, but the danger is obvious of moving over the Seine against the south of Paris, if such operation were liable to be taken in reverse. In addition to the great roads, three important rail-lines leave the capital by this angle Marne-Seine. The measure of the care taken by the Germans in 1870 to occupy this ground solidly is the measure of the precautions now taken to preserve it for the defence. The great sortie made in the November of the war failed for one reason that, from the close investment, it was impossible to deploy on a large front. By pushing forward the forts a great army may now debouch at its leisure on a commanding *s.a.l.* Four formidable works—Villiers, Champigny, Sucy, Villeneuve—in the order named divide the ground from Marne to Seine. These are supplemented by redoubts or closed batteries. The position of Villeneuve at the confluence of Seine and Zèbre commands at once the valley of the Seine, protects an army debouching on to the wide plateau of La Brie, and obliges an enemy about to cross the Seine to do so much higher up. Passing the river ourselves at Villeneuve we reach the southern front. As the whole system came under debate it was, when considering its applicability on this side, that those who advocated a wide sweep of the arc of defence, and those who would describe a lesser circle, had a hot discussion. M. Thiers had conceded on the other fronts to the partisans of the former system, more or less willingly, all they wanted; but he was not to be moved from his objections to giving the southern face what he considered "une extension démesurée." His reasons, from his point of view, were undeniable. He recommended utilizing the peculiarly defensible plateau comprised between Paris, Versailles, and the course of the Bièvre. Its occupation would defeat an attempt to repeat the bombardment of the city from the crests on which stand Châtillon and Meudon. The plateau, six miles square, would hold an army, and with the aid of a few small works would constitute an impregnable stronghold. But the authors of the new fortifications had other ideas in their minds than the preservation of a defensive attitude. The Engineer generals, Charon and De Chabaud-Latour, have never admitted the theory of passive defence. Their plans were made on the assumption of Paris containing forces sufficient for taking the offensive, though the forts themselves by wise arrangement will require but slender garrisons. They counselled, therefore—and their conclusions were adopted by the National Assembly—pushing across the Bièvre and the deep parallel fosse in the plateau and occupying this plateau to its furthest extremity, where it overlaps the stream of the Yvette. Crossing then the Seine at Villeneuve, we traverse open ground till, ascending to Palaiseau, this large fort at one angle of the immense plateau is reached. It is a little over ten miles from Paris. At the other end is the large fort of St. Cyr, eleven miles from Paris, ten from Palaiseau. Between the two great works are minor ones—Haute Buc and Villeras. Behind Palaiseau is the fort of Verrières. Near St. Cyr, and along the line at intervals, are connecting batteries. Much has been gained through the extension of that line or rather arc. In the first place the towns of Versailles, Sceaux, St. Cloud, Sèvres, are now comprised within the fortifications; sorties in immense force can be securely organized; an outlet is commanded on the Rouen road, or that of Dreux, of Orléans, or of Fontainebleau; and, in the very improbable case of the exterior works falling, it will still be open to retire to the line of the Bièvre, advocated by M. Thiers. There will always be time to throw up works on the inner circle, seeing that the reduction of any single fort must be a labour of regular approach. Continuing, we leave St. Cyr, which, with its annexes, effectually covers Versailles, and traverse the plain of the Rû de Gally, till we ascend the elevated plateau of Marly, which closely overlooks the southern side of the second bend of the Seine. A group of forts here sweeps on the south the approach to Versailles, on the south-west and west a wide open plain, on the north commands St. Germain and the passage of the Seine, but on the north-west is somewhat inconveniently hemmed in by the dense forest of Marly. A considerable wood affords, of course, cover to an approaching enemy. It was at one time intended to throw up works

at St. Jamme and Aigremont, enclosing the forest at a distance of some twelve miles from the city *enceinte*: but this, it was then argued, would have necessitated additional defences on the heights of L'Hautie, which stand out in commanding relief just below the confluence of Seine and Oise. And, it was said, too great an extension would in that case have been given the line, and that to keep up uninterrupted communications with essential points would entail the employment of a more or less numerous force. The wise rule has been observed throughout the whole of this stupendous scheme not to occupy positions which would demand other aid than that of the garrisons holding them. The army is not for assisting the forts, but the forts are there to give assistance to an army undertaking outside operations. We should entirely mistake the principle of the scheme if we looked upon the new fortifications as built simply to stand a stronger siege than before. They are intended to protect Paris in the first instance, but, had that been the only object, a better system would have been found.

The question is a large one; but it seems clear to us, if one rule has been observed another has been broken in making the line from Versailles to St. Germain one purely defensive. Everywhere else the line is regulated to secure a potential offensive. Were the defences carried forward to Jamme, Aigremont, and the heights of L'Hautie, as eventually, we think, will be the case, a large tract of rich land would be enclosed, and a retreat could always be effected on the prepared and secure position of Marly.

A glance at the map shows the remarkable serpentine bends of the Seine after leaving Paris in a north-westerly direction. It curves south to Sèvres, then sweeps back north-east to St. Denis, again runs in a long stretch south-west to Marly, resumes with a curve its northern flow to Cormeil, sweeps round the forest of St. Germain south to Poissy, and once more bends back to half encircle the heights of L'Hautie. Under the new conditions it would be madness for an enemy to move on the capital over the several river-bends. Every one of the re-entrants or peninsulas, each about twenty-five square miles in extent, formed by the Seine, is swept by flanking fire, with the exception of the outermost, by L'Hautie. As it was, the Prussians never succeeded in establishing but a temporary occupation of the peninsula of Gennevilliers, which is commanded by the powerful fortress of Mont Valérien. We are now arrived at the ridge, in shape like a narrow dorsal fin, that stretches four and a half miles, from Argenteuil to Cormeil, and has excellent fire-reach from the latter place across wide open flats on three sides. A powerful work—Cormeil—has here been constructed, which crosses fire with Montlignon, the westernmost of the northern group we noticed in the first instance, and completely covers the ground to the confluence Seine-Oise. A succession of redoubts crowns the ridge, giving command, on the one side, over the peninsulas of Argenteuil and St. Germain, on the other enfiling approach to the northern forts from the forest of Montmorency.

Independently of works, closed and casemated, in front line, it has been determined to fortify certain intermediate points in rear. The in some cases enormous distances—making every allowance for powerful gun-fire—which separate the new forts seem to render such precaution imperative. If, through surprise, treachery, or panic, one of the larger works did fall, a huge gap would be created, and the whole circle possibly imperilled.

The numerous rail-lines radiating from Paris give an easy means of transporting troops when concentrations are proceeding on any point of the circle; and a circular railroad (*de grande ceinture*) is being laid down to run round the entire distance a short way within the rim of forts. The laying out of and securing strategical lines of communication in particular zones of the vast area are subjects which have received the closest consideration.

An army assuming to effectually blockade Paris, as in 1870, must be numerous enough to invest it on a circle of a hundred miles, instead of as before, on one less than fifty. To-day the *rôle* as regards possessing advantage of ground is altogether changed. The besieged hold all the commanding positions. Generally speaking, the assailant must traverse wide open plains swept by a powerful cross-fire; he can no longer bring concentric fire to bear within a limited circumference; to combine against a sortie the assailant must move on a wide arc, while the defender moves on a short line. A German critic has proposed the blockading of the whole circle by a certain number of armies massed at certain points, and connected by numerous divisions of cavalry. But we see no advantage to be gained by exposing, say, the army of the north or south to be crushed by a sortie in vastly superior force before those of the east or west could come to the rescue. Paris will not another time be found practically without an army available for offence.

The garrisoning of Paris in the first instance will devolve on four "regions," the headquarters of which are Amiens, Rouen, Le Mans, Orléans. These will contribute at once 80,000 regulars and 120,000 "territoriaux." Not a man—and this is a most important point—will be drawn from the first field army for its defence. But it is only reasonable to believe that the million of soldiers whom France will send forth in the first alarm will not be spirited away entirely as happened before, but that if the "barrier of iron," in the shape of gigantic fortifications all along the frontier, is forced, an immense margin will be available in retreat for the defence of the capital. There would seem, indeed, to be only two possible ways now, by which an invader might bring the invaded to terms; and these would be the existence of profound disunion among the French themselves, or

by means of another coalition. United Germany is manifestly unequal to the task, and we trust that the *Times*, whose articles in 1870-1 we well recall, when contempt was heaped on the French, and they were told they would never recover from their defeat or be able to face the Germans again, will take stock of this fact. When we remember that on her defence France would shortly place under arms over two millions of men, and would be feeding them on her own ground, we may form some idea of what task the invading armies would have before them. How are they to feed their necessarily colossal numbers? It would require twenty corps d'armée of 30,000 men each, allowing one—a small allowance considering the probable strength of the garrison—to five miles of ground, to blockade Paris. An invader must reckon also with the strongly entrenched camps of Épinal and Belfort, of Langres and of Besançon, the lines of La Fère, the entrenched position of Rheims, the fortresses of Verdun and Toul belted with forts, the fortified plateau of Haye, the permanent works defending the Moselle by Nancy, and those defending the chain of the Côtes de Meuse on the north-west frontier; as also, in another direction, the entrenched camps of Dijon, and further south, of Lyons. All the above defences, where not new, have been enlarged to meet modern necessities; they are constructed on a great scale, solidly fortified, and are most of them ready to receive, if they have not received, their armament.

To those who would study this interesting subject in detail, with the advantage of perusing a precise and picturesque description of localities, we can cordially recommend M. Eugène Ténot's valuable work already referred to.

IRELAND, IN AND OUT OF PARLIAMENT.

THE principal feeling which the debates of this week must have left in the mind of any member of Parliament who has energy left to be conscious of any feeling must have been one of astonishment at the moderation, all things considered, of the Irish members. They only brought forward four amendments on the Address, and three of these have only taken four nights between them. The adoption of the proceedings of Mr. McCarthy and Mr. Dawson by all Mr. Parnell's followers would have been technically justifiable, and there could then have been no reason why, as the Speaker suggested on Wednesday, the House should not go on debating the Address until autumn and prorogation came. On each of these amendments Mr. Leamy and Mr. Hoaly, Mr. Sexton and Dr. Connors, might have spoken, and the non-Irish part of the House might have abstained from speaking, which has, in fact, been the programme of proceedings in the House of Commons for the greater part of the last fortnight. It is much better that certain honourable gentlemen should speak in the tone in which they perforce speak at Westminster than in the tone in which they speak for the benefit of the assistants at a Land League meeting. In this way the existence in Session of the High Court of Parliament really serves as no small alleviation to the woes of Ireland. Whether the spectacle which the said Parliament presents is a dignified one is another question. But it is, at least, probable that some time will elapse before any forcible measures are taken to put down the obstruction, which is all the more formidable because it is outwardly quite decent and in order. The precedents which the ingenuity of Lord Edmund Fitzmaurice and the historical knowledge of Mr. Thorold Rogers have unearthed are not encouraging, for they date from the days of the most high-handed and unconstitutional proceedings of which Parliament has ever been guilty. The temper of the modern Radical is scarcely such that he can be trusted with machinery capable of enforcing the will of a majority in spite of the opposition of a minority, and there is no doubt that the Irish party knows this, and trades on the knowledge. How far they will permit themselves to go remains to be seen, and it is not at all impossible that they will actually overstrain the patience of the House. The present Opposition is in this respect unlike the last, that no merely party considerations are likely to actuate its leaders. Sir Stafford Northcote and his late colleagues no doubt know the danger of entrusting to Mr. Gladstone's hands a weapon to be used against themselves, but if it is necessary in the public interest to entrust him with it, it is pretty certain that they will not hesitate.

Meanwhile, Ireland itself, from which the attention of the public has been somewhat turned away for the last week or two, is experiencing more and more the inevitable results of the delay which Ministers have permitted themselves. The solemn proceedings in the Court of Queen's Bench have been enlivened by one of Mr. Sullivan's "fervid" addresses. Most people know what fervour means in connexion with Irish eloquence. It means adjectives. In this description of fervour Mr. Sullivan is the inferior of Mr. Davitt, and is left far behind by that impulsive Canadian archbishop who recently talked about corpses whitening the track of emigrant ships, or some similar phenomenon. But even Mr. Callan's late colleague can be fervid enough, and the enthusiastic admirer who threw him a bouquet at the conclusion of his speech appraised the value of that discourse more accurately than, perhaps, she knew. Had the Queen's Bench been the Queen's Theatre nothing could have been more appropriate. A consideration of all the circumstances is not expected in a *tirade*, and we do not find fault with Camille or with Almanzor for not being strictly logical. Mr. Sullivan's beautiful description of law as

mirroring forth the eternal equities of God, deserves to have been enshrined in lines of ten or twelve syllables. But in prose it somehow chiefly conjures up visions of carders and boughers, hedge-assassins and trampers in the blood of murdered men. What, we wonder, do those persons mirror forth? However, Mr. Sullivan might answer us that actual outrages have decreased of late. They certainly have, and considerable portions of Ireland are enjoying the peculiar blessings of the peace of Mr. Parnell. The intolerable nature of the situation is forcing more and more landlords to throw up the game, and either to leave the country or to make terms with their persecutors. Even Mr. Bence Jones is said to be about, not indeed to give in, but to depute the task of actively making head against Boycotting, to other hands. The recent support of process-servers by large bodies of the police, and the resistance offered to the latter, has shown at once what might have been done, and ought to have been done earlier, and at the same time the dangerous height which the spirit of resistance to the law has reached. Summary sentences on a few Boycotters, and the prosecution of the Truce Land League, have in the same way shown at once the efficacy of shut doors, and the folly of waiting to shut the door till half the steeds are stolen. Meanwhile, arms are, according to every trustworthy source of information, pouring into the country, and the Home Rulers publicly announce that the passing of any coercion measure will be a signal for revolt. Any permanent success as against the military power of England such a revolt would not be in the least likely to have, but it would probably mean the repetition—on a very small scale it is to be hoped, but still on some scale—of the horrors of 1641 as regards outlying landlords and their families. Forty thousand troops and Constabulary are more than a match for all the Land Leaguers and all the Irish Republican Brotherhood in the field, but they are not enough securely to guard thousands of isolated homes. It must be remembered that for months the language which has been used at Land meetings has not merely been an encouragement to the withholding of rent; it has been a perpetual representation of the landlords as scoundrels and villains of the deepest dye. Such words are only too easily translated into deeds when the spirit of lawlessness once breaks out into actual civil war. In the earlier days of Fenianism no special class of the population was held up to the execration of other classes, and the danger then was therefore far less than it is now.

In England the active Irish party are pursuing the line of tactics recommended to them on a famous occasion with remarkable vigour, but with a servility of faithfulness to the exact line pointed out which speaks little for their inventive powers. The manner of the Clerkenwell explosion and the scene of the Manchester assassination have been combined with a deference to the Prime Minister which is almost touching. There are, we believe, persons who profess to regard the recent explosion at the barracks of the 8th Regiment in Salford as "entirely devoid of political significance," and of course with such persons it is impossible to argue. The affair was in every respect, except definiteness of object, a repetition of the Clerkenwell attempt, and it may be something more than conjectured that the possession of arms, instead of the liberation of comrades, was the special purpose of the conspirators. In futility and in brutality alike the attempt bore the well-known Fenian mark. The death of one boy, the serious or mortal injury of a woman, and the slight injury inflicted on a girl may be results unsatisfactory in amount to the gallant members of the I. R. B.; but in kind they must be thoroughly congenial. Your Fenian was especially with non-combatants, and unarmed persons are peculiarly wont to "get in the way of his bullets," as his apologists put it. Nor does it appear that the Salford business stood alone. Manchester, as most people know, is a considerable military station, and boasts cavalry as well as infantry barracks. Information is said to have been furnished to the authorities as to an intended attack on the cavalry barracks at Hulme, and these also are now guarded and watched with peculiar care. As there is a magazine at Hulme, containing ammunition enough to blow up half Manchester, it is probable that the neighbourhood is in some trepidation, and an election to-morrow for the city might perhaps have no very different result from the Wigan election last Tuesday. It has been more than once pointed out that it is unkind of the Irish to repay Mr. Gladstone for his lessons in the art of agitation by applying them at a time and in a manner so inconvenient to him. The explosion in Regent Road had, beyond all doubt, an echo on the polling day at Wigan, and other explosions of the same kind will assuredly have similar echoes elsewhere. These are things which the Government would perhaps do well to take into consideration. It is an ingenious Parnellite argument that, provided that not many people are hurt, it does not matter how many are frightened. Its ingenuity, however, exceeds its truth. In England—on account, doubtless, of our well-known national timidity—we have a strong objection to be kept in a perpetual state of alarm, and to such a state the past conduct of Mr. Gladstone's Government and its ambiguous policy at present seem to be reducing us.

THE PERFECT AMBASSADOR.

"AN ambassador," according to the witty quotation recently made in an English journal, "is an honest man sent to tell lies abroad for the good of his country." Sir Henry Wotton, of course, defined the ambassador as "an honest man sent to lie

abroad"; but the point of the jest somehow escapes in the modern telling. The Scotch gentleman who heard an amazing story told in company, accounted for his own calm amid the general astonishment by saying "I'm a leear mysel'." That an ambassador was bound to be a "leear" himself, and look on all the rest of the world as liars, seems to have been an accepted fact in the seventeenth century. Don Juan de Vera y Figueroa made no attempt to conceal his opinion in his work *El Embajador*, which was translated into French as *Le parfait ambassadeur*, and published furtively by the Elzevirs in 1642. *Le parfait ambassadeur* is in the form of a dialogue between "Louis et Jules, devisans ensemble." The author takes us into the garden where the pair of friends discourse among the fountains, and the trim gardens, where stands the statue of Mercury, the patron god of all ambassadors. The discussion, in which Louis unfolds the virtues of a diplomatist, is in the quaint learned style of the time. More examples are chosen from the Bible, Livy, Plutarch, and Cornelius Nepos than from recent history. In the course of the dialogue, the whole character and position of the ideal ambassador is unfolded, but the most curious and characteristic part of the work is its casuistry. Both Jules and Louis, especially Jules, are honourable men. They have a fixed instinctive horror of *menterie*, and, moreover, an awful apprehension of the future penal consequences of this deadly sin. But it is the business of Louis to show Jules how an ambassador may "hedge," both for this world and the next, and lie without ceasing to be a gentleman of honour, and a Christian who keeps on the safe side.

It must be owned that ambassadors have their peculiar temptations. We presume that the Turks, though difficult people to deal with, are not quite so demoralizing as they were in the seventeenth century. Louis gives a singular example of want of *finesse* in a Turkish ambassador. This diplomatist learned the extent of a Venetian ambassador's instructions from a secretary of the Embassy, and at once pushed his demands to the point which he knew the Republic would, in the last resort, concede. The Venetian ambassador, honest man, said that "his instructions did not permit him to go so far." "Why this subtlety?" asked the Turk; "has not your own secretary told me that you are allowed to grant what I demand?" The wretched secretary was put to death when he returned to Venice. In these days the Turks, by a singular scruple of conscience, considered no treaties binding which were not written in their own language. When Venice was concluding certain terms of peace with the Porte, the "Bacha" had the capitulations couched in Latin. But Andrea Gritti, the Venetian ambassador, declared that he would not sign the treaty if it were not written in Turkish, which was disappointing to the "Bacha," and very vexatious. It does not seem to have occurred to the astute Islamite that he might have probably written something else, say a chapter from the Koran, in place of the capitulations. Probably few European ambassadors were good enough linguists to read the Turkish manuscript. So difficult was it to approach the Grand Turk that Venetian envoys occasionally had to disguise themselves as merchants, and so steal into the presence of the despot. Neither Turks nor Russians were pleasant to deal with, for the Grand Duke of Muscovy nailed an ambassador's hat on his head, while Soliman threw a Hungarian envoy into prison for proclaiming too rapturously the praises of his master. Amurath, in a moment of bad temper, actually put to death Frederick Orcobis, ambassador of the Emperor Maximilian, and all the members of his suite. Among unscrupulous characters of this sort an envoy had to consult his own safety. "He cannot be absolutely good," says Louis, "and must be content to be relatively virtuous." That is, he must only lie when it is absolutely necessary; and, when he does lie, the casuists make as many saving distinctions as Touchstone himself.

There are passages in "The Perfect Ambassador" which almost entitle it to the name of "The Complete Liar; or, the Mendacious Man's Vade Mecum." Elaborate instructions (a luxury, surely, rather than a necessary) are given to the ambassador in the art of hocussing his conscience. If he is told to do anything particularly villainous, to deceive the prince at whose Court he is residing, or the like, he must reason thus:—"I do not like the look of the thing, myself; but I must remember that my master and all his advisers have no sort of scruple about it. Learned men, then, have taken a view which is not mine; therefore it is purely a matter of opinion." "By this means," says Louis, "he will be able to do what he is told with his eyes shut." And then the ambassador is reminded that Joab did all sorts of shady things by command of King David. There was the census, for example, which David was anxious to take. Joab, though not usually scrupulous, was shocked (like the people of Cyprus now) by the shocking impiety of taking a census. However, David insisted, and the thing had to be done. Again, Papinian should have apologized for and defended Caracalla when that Emperor committed fratricide. But Papinian chose to take a high moral view, with the very worst results. For, up to that moment, Caracalla had at least been anxious to make excuses for his peccadilloes. Vexed by the unreasonable austerity of Papinian, Caracalla grew quite reckless, and arrived at such a pitch of contempt for his own reputation, that he committed a number of other murders, beginning with that of Papinian himself. So Papinian took nothing by his obstinacy, and the Perfect Ambassador will do well to be warned, and keep his misgivings to himself.

After debauching the mind of Jules by these plausible considerations, Louis now leads up to the great question, May an

ambassador tell lies? On the whole, the answer is that he may; but they must not be "gross palpable lies" like those of Peter, in the *Tale of a Tub*. Jules is told to remember that several people of merit in the Bible told lies, notably David, Judith, and the Jewish midwives when interrogated by their Egyptian tyrants. This conduct was not absolutely correct, but still it is chronicled for our example, to show that we must not always be too particular. On this point Louis frankly admits that the great and learned St. Augustine held a very strong opinion, and maintained "that it is not lawful to lie, even for the glory of God." Cicero also denied that the end justified the means. But, on the whole, Louis thinks that there is a way "between the two extremes to steer." For example, one thing is clear—namely, that the ambassador should never believe what any one tells him. There is a kind of dissimulation even in this attitude; it is deceitfulness which "is not very far removed from rectitude." There is a second class of deceit which "approaches the limits of vice," what the lawyers call *bon dol*, but the third is "abominable injustice." Of this form of deceit an ambassador, who is also a sound Christian, will do his very best to keep clear. Then an ambassador may use deceit, but he may not use deceit with the sole purpose of harming others. For example, he may bribe and debauch the Ministers of the Court to which he is accredited, but it must be for the purpose of advancing the interests of his master, not of injuring those of other people. In moral matters intention is everything. An ambassador who is, as he ought to be, of noble house, good name, beautiful presence, and large wealth, is probably a gentleman who naturally dislikes to hire spies, bribe Ministers, and haunt the society of women of no character. Yet these ladies, says our author, are always the first to hear of everything that is going on, and he insists that the Perfect Ambassador must secure their services. The bribing of men about the king's person is still more offensive to the conscience, but it must be done. The ambassador must remember that his intentions are just and pure, and that the people he has to do with are, unfortunately, persons wholly devoid of conscience and the sense of honour. By musing on these considerations the ambassador will be able to listen outside doors by deputy, to cajole, and swindle, and corrupt, without lowering his own moral tone or losing his own self-respect.

When he converses with the prince to whom he is accredited, a conscientious ambassador will, of course, be very particular about telling the truth. Yet even here there are distinctions. If there is a subject on which to tell the truth would be highly prejudicial, while to lie would be most advantageous, the ambassador must not introduce the topic. That would be quite wrong. But if the prince to whom the ambassador is accredited introduces the topic, and leads the conversation "*dans le sujet sur lequel tombe la menterie*," that is quite another thing. The prince may ask point-blank questions; a truthful answer might be very inconvenient to the interests of the ambassador's master. Yet he cannot refuse a reply, for courtesy forbids such reticence. "And when the curiosity and the constant questions of the prince compel him to speak, supposing that in his discourse he happens to let fall a few falsehoods, then, if they do not tend directly to the hurt of the country in which he is resident, but merely to the glory of his own master, the ambassador has committed no very great sin."

To manage his conscience with discretion, to read the *Casuists* daily and nightly, to write his despatches in cipher, not to keep buffoons about him, to be brave, secret, and liberal, are the chief qualities of the ideal ambassador. It would be interesting to know, now that casuistry is out of fashion, how ambassadors deal with their consciences. Surely Count Schouvaloff did not study Escobar, and Sir Henry Layard would have been horrified by the insidious suggestions of Louis. Yet ambassadors have to deal with the same classes as of old; with kings, sultans, royal barbers, women of the court, and, a plague unknown to Jules and Louis, with newspaper correspondents. It would be interesting to know how the author of *Le Parfait Ambassadeur* would have advised his diplomatic readers to treat the representatives of the press. We cannot but think that he would have advised the most flat and robust *menterie*, and would have reasoned thus:—"Your press correspondent will not report what you tell him, but will alter it to suit his own tastes and ideas, or those of his paper. Therefore the *menterie officieuse* may be adopted, for, in altering what you tell him, he may possibly come to speak the truth by accident, to the great profit of his soul. You, for your part, will not have lied, but have done your best to secure the promulgation of the truth." "Men change, human nature is unchanged," says the author of the *Parfait Ambassadeur*. The troubles and difficulties of which he wrote must still be felt by every one who has not been a diplomatist for more than ten days. Afterwards, probably, a professional conscience takes the place of the normal moral sense.

is not so generally acknowledged, and does not at first sight appear by any means so intelligible as that Erastianism can persecute in the interests of religious indifference almost as ruthlessly, if not with the same zest, as the most rigid zealots of religious orthodoxy. This is the moral of an interesting article on Barneveld and Grotius in the new number of the *Church Quarterly Review*. And as the particular historical episode with which the writer deals is not, any more than the principle he desires to illustrate, familiar to the general run of even well informed readers, it may not be out of place to bring it under the notice of our readers. The name of Grotius is no doubt well known to "every schoolboy," but many who are no longer schoolboys know little or nothing of his writings or his life, and the very name of Barneveld may probably be new to not a few who cast their eye on the *Church Quarterly*, though he played an important part at the time in the religious and political history of his country. He was Seal-keeper of one of the Seven Provinces, and Grand Pensionary or Advocate—in fact chief minister—of Holland, which was the leading State of the Union. He had used his leading position to bring the long war with Spain to a successful termination, and had been treated almost on equal terms by Henry IV. of France. At the Congress of the States General he was the Ambassador of Holland, but practically exercised, as Motley says, the power of Minister of Foreign Affairs, and as it were Prime Minister for the other Confederates by their common consent. It is however rather with his action on the internal than on the foreign affairs of his country that we are here concerned. The struggle with Spain had been in great measure a religious one, and the Genevan or Calvinistic form of Protestantism had been established in great part of the Netherlands, but not in its extremest development. The "Belgic Confession" did not pledge the ministers who subscribed it to a maintenance of the strict principles of Calvin, and of this both Barneveld and his friend and adviser Grotius were fully aware when Arminius began to propound his opposite views from the Chair of Theology at Leyden. Their mistake lay not in claiming for his teaching a toleration to which it was justly entitled, but in seeking to enforce on dissentients a creed, however tolerant and admirable in itself, by the strong arm of the law, and thus meeting the fierce intolerance of the Calvinistic party by an Erastian intolerance of their own, which proved as disastrous to their own personal interests, as it was only too likely to prove to the true interests of religion.

When Arminius began to teach publicly, he knew perfectly well that "the Belgic doctors were not obliged by their confession of faith, nor by any other public law, to adopt and propagate the principles of Calvin." Unless this be distinctly kept in mind, the full significance of the intolerant persecution with which he and his followers were assailed will not be rightly estimated, nor will the causes for holding the various Synods, culminating in the Synod of Dort, be understood. It was not to bring the teaching of the Arminians to the touchstone of the received confession that these Synods were held. It was, by means of an unscrupulous Calvinist majority, to make alterations in, or additions to, the accepted confession, which should prevent any but Calvinists officiating in the Protestant body. The position of the Arminians, in publishing their Remonstrance against the decrees of the Synod of Leyden, was a perfectly sound and legal one. It was not they who were the dissenters from the established creed. It was Gomarus and the Calvinists who were the dissenters, by enacting new conditions of conformity.

It was not till after the death of Arminius that the crisis came. Vorstius succeeded to his professorship, who was reputed a free thinker, and had published a Latin treatise on the Nature and Attributes of God, which many considered to be blasphemous. A copy of this work was despatched—apparently by the author—to the royal pedant and theologian, James I. of England, who in his assumed capacity of Protestant Pope, was not satisfied with ordering it to be publicly burnt at Oxford, Cambridge, and London, but extracted from it a Syllabus of Errors, which he sent to the States General, directing his Ambassador at the Hague to insist on the "blasphemous monster" who wrote the book being at once expelled from the country; he even threatened to make it a *casus belli*. Barneveld, to his credit, declined to yield to this imperious, not to say impertinent, foreign dictation, and though Vorstius had to undergo a trial he was retained in his Chair, to the no small indignation of the Calvinist ministers. Barneveld determined to quash their opposition by the assertion of a State supremacy over the Church as arbitrary and persecuting in principle as that which they aspired to exercise over their Arminian fellow Protestants. And he was assisted in his designs by that marvel of juristic science and erudition, Hugo Grotius, who at the age of fifteen had received the degree of Doctor of Law at Paris. Grotius had arrived by a somewhat different line of thought at much the same conclusion as Barneveld as to the relations of Church and State. His doctrinal sympathies were already inclining in a Catholic if not Roman direction; he laid great stress on the supreme importance of ecclesiastical unity, which it was the duty of the civil magistrates to maintain, and had published a treatise under the title of *Prelas Ordinum Hollandiæ* advocating these views, which seemed to him to be laudably exemplified in the Government of England. There was however, as the reviewer points out, one very marked difference between the religious condition of England and the Netherlands, for while the English Dissenters rejected the formularies of the Established Church, in Holland the rival sects of Arminians and Calvinists had accepted a common confession and belonged to the same religious body, in which each party therefore had equally a legal status. The question was how to make them keep the peace together, and this Barneveld resolved to achieve by imposing under the pretext of an "explication of contrarieties," and by civil

THE CHURCH QUARTERLY ON ERASTIANISM AND PERSECUTION.

IT has often been observed before that "the Calvinist is essentially a persecutor," and there is little lack of historical evidence available for the fact. Nor would it perhaps be difficult to find a theological explanation of the peculiar temper of sour intolerance which not unfrequently distinguishes thoroughgoing professors of that stern school of belief. What

authority, a new symbol of his own—something in the manner of the imperial *Type* and *Etchings* of an earlier age—which both parties should be compelled to subscribe. Grotius was asked to draw up this remarkable “edict,” which commenced as follows:—

In the explanation of the Scripture, as often as occasion shall offer, the Pastor shall declare to the people and instill into the minds of all under their care that men are not indebted for the beginning, the progress, and the completion of their salvation, and even of faith, to their natural strength or works, but to the sole grace of God in Jesus Christ our Saviour; that God has created no man to damn him; that God has not laid us under a necessity of sinning, and that He invites no man to be saved to whom He is resolved to deny salvation,” &c., &c.

This may be sound sense and sound theology, but it was notoriously a theology in the very teeth of the first principles of Calvinism, or Gomarism, as it was sometimes called in Holland from Gomar, who, like Arminius, held a professorship at Leyden, and many Calvinist ministers accordingly refused to sign it. Barneveld upon this induced the States of Holland to adopt “the Sharp Resolve,” that is, to put down all opposition by armed force and expel all ministers and congregations which refused the edict. This was no less directly persecution than that practised, before and afterwards, by the Calvinists, but one significant distinction is worth noting. The Erastian persecution, then as at other times, was almost exclusively the work of statesmen, while the persecution of the Arminians which followed, was the direct work of the Calvinist ministers. Erastus himself, whose system was originally levelled against the Calvinists, like Barneveld and Grotius, was a layman, and it was mainly from the statesman’s point of view of the importance of outward uniformity that the “Sharp Resolve” was decided upon. Grotius indeed combined a profound reverence for Christian Antiquity—perhaps, as Hallam thinks, prompted in the first instance by his finding Antiquity so unfavourable to Calvinism, which he detested—with his Erastian principles as to the authority of the civil magistrate in matters of religion. But his scheme, to cite Hallam again, “is in a modified degree much the same as that of Hobbes,” and the theory of Hobbes is the natural upshot of the teaching of Erastus. The *Church Quarterly* writer points out, not unfairly, that Jeremy Taylor’s *Liberty of Prophesying* leads to a similar result. If Grotius argued that the civil magistrate should determine the form of religion to be publicly exercised, and allow no other, Jeremy Taylor would have all such religionists tolerated as agreed to accept the doctrine of the Apostles Creed, and no others. The one would allow a variety of sects with a common bond of religious profession, the other a variety of opinions in a common Church. But each would draw the line at a point arbitrarily fixed by himself, and thus either view would ultimately involve “persecution on liberal principles,” and people do not like any better being coerced into Latitudinarianism than being coerced into rigid orthodoxy. One is reminded of a rumour current some years ago of the determination of the Mikado to promulgate a new religion for the Japanese—who are reported by recent travellers to be “tired of the old ones,” and something more than tired of all old moralities—which new religion was to be “enlightened, simple, and adapted to common sense, and all will be compelled to conform to it.”

The result of Barneveld’s scheme of Erastian persecution was unfortunate alike for himself and for his clients. He carried with him the State of Holland, and each of the Confederate States had a right by the constitution to control its own religious affairs. In spite of this however the Assembly of the States-General determined on convoking a Synod to settle the claims of the Arminians, and hence arose the meeting of the famous Synod of Dort, the Tridentine Council of Calvinism. From such an assemblage the Arminians had neither justice nor mercy to expect. “It is good that they should be informed,” said one of the Calvinist Elders, “that they come not to conference, but to propose their opinions with their reasons and let the Synod judge of them,” and their reasons were to be given in writing. They were condemned unheard, and some 700 ministers, who refused to subscribe the canons of Dort were banished with their families. Barneveld was tried and executed, in spite of his lofty character and eminent services to his country. Grotius was condemned to imprisonment for life, but happily contrived to effect his escape, which seems little short of miraculous, in a book-chest less than four feet long, “and not very broad in proportion.” He had utilized his period of captivity to compose the treatise *De Veritate Christiane Religionis*, and afterwards occupied the position of Ambassador of Sweden at Paris, where he enjoyed the patronage of Cardinal Richelieu, and wrote in vindication of all, or nearly all the doctrines of the Roman Catholic Church, which he is reputed to have contemplated joining at the time of his death. But with his subsequent career we are not further concerned here. It will be seen then that the attempt at Erastian government, enforced by persecution, in the interests of religious toleration, proved a conspicuous failure in Holland, and the reviewer is probably not far wrong in suggesting that his attempt to rule the Church through the royal supremacy rather than by more spiritual methods was one cause of the tragical failure of Laud’s ecclesiastical administration in England. The instinct of all religious bodies, Catholic or Protestant, is sooner or later to revolt against civil supremacy over the conscience, and Erastianism which comes under the spurious guise of liberty inevitably turns out at bottom to be persecution. The creed it enforces may be, like the proposed Japanese compromise, “enlightened, sensible, and simple,” but it will not therefore commend itself to everybody’s convictions, though everybody “will be expected to conform to it.”

FAIR RENTS.

THE second of the tried of Irish demands, which are now exercising theorists and practical men alike, may perhaps be termed the Bala of the three F’s. It is impossible for any phrase to have a more ingenuous, conciliatory, reasonable appearance than the phrase of Fair Rents. Who is there so outrageous as to maintain that people ought to be made to pay unfair rents? and who, save a small minority, is there who even insists that such rents shall be paid whether they ought to be paid or not? Besides, Fair Rents is, or ought to be, a double-edged expression, embodying or obeying all the principles of distributive justice. The rents, of course, are to be fair to the landlord as well as to the tenant. Surely, then, the person who objects to them must be hard to find, and harder to bring to any reasonable argument when he is found. Besides, just as a certain class of persons delights to represent the Irish landlord as assaulting sixty of tenure by the process of eviction, so does it delight to represent him as perpetually raising his rents. He raises his rent in order that he may evict; and, when he has evicted, he raises the rent again upon the unfortunate incomer. Much of this, of course, is the idlest and most unsupported babble; much of the supposed exorbitancy of Irish rents depends upon the variation in size between the Irish and English acres, the first of which exceeds the second by more than one half; much omits to take into consideration the pasture rights and other small privileges which the smaller Irish tenant usually obtains with his holding. Above all, the fact is to be remembered that all good landlords—that is to say, the great majority—constantly remit rents *en bloc*. A rent rather higher than it ought to be, tempered by occasional complete remissions, is a clumsy sort of arrangement, no doubt, though it probably suits the habits of a people among whose virtues thrift has never been counted by their most frantic panegyrists well enough. But, at the same time, it must be admitted that such a system is quite certain to destroy even such germs of thrift as may be ready to develop themselves, and therefore it is hardly one which should be encouraged if it can be avoided. Fair Rent, therefore, is a thing which all reasonable people ought to welcome if it could be got, if it would not injure existing rights, and if it were likely to do good in the future. Let us see, then, how the answer to the question implied in the three F’s stands.

In the first place, there is an obvious difficulty which is by no means a quibble. What is Fair Rent? According to the contention of the extreme Land Leaguers, it is nothing at all. According to the contention of those not quite so far advanced, it is the surplus produce after the occupier has spent freely on everything which he feels inclined to buy, and has laid aside something as a nest egg. According to a less impudent class, who rely on the arguments of certain English economists, it is the residue, not after such deductions as these have been made, but after the farmers’ and labourers’ “fair” profits have been deducted. According to a fourth, it is whatever the land is valued at in reference to the prices of produce from time to time by skilled and impartial valuers. According to a fifth, it can only be ascertained by an elaborate arrangement of comparative estimates in each individual case. According to a sixth, it is simply what it will fetch in the open market. Now this is certainly a very considerable divergence. The first two explanations may of course be left out of consideration in any serious argument on the matter. The third is obviously of no practical service because the ambiguous word “fair” occurs in both sides of the equation. To settle what is a “fair” rent for the landlord by making it the remainder after a “fair” income is deducted for the tenant is a task which only Mr. Ruskin would be bold enough to attempt. The last solution, that a fair rent is best settled by competition in the open market, is the solution actually in force, and it is this which the advocates of Fair Rent especially desire to supersede. We are, therefore, driven either to the plan of a general valuation, or to that of a court of arbitration sitting permanently to adjudicate on each particular case. The former alternative may seem to be favoured by the existing agitation for Griffith’s valuation. It may, however, be something more than suspected that the real charm of that valuation is the fact of its being notoriously inadequate. Nobody, perhaps, except irreconcilable Land Leaguers will contend that by Fair Rent is to be meant a perpetual rent-charge fixed once for all. On the valuation system, then, a fair rent must be attained by something like the plan now adopted in reference to English tithes. A fresh valuation either based on corn averages, or on something else of the kind, must be made every seven years, every fourteen years, every twenty years, or at any period which may be fixed upon. It does not, however, need preternatural acuteness to see what would be the result of this. Even in easygoing England the system of corn averages has provoked a formidable grumble; what then may it be expected to do in discontented Ireland? Besides, in the nature of things, the periodical revisions of rent would be in the direction of increase. Is there any reasonable creature in existence who doubts that at every such period we should have a new Land League, a new agitation, a new attempt to unsettle the settlement? So much for the plan of a general valuation. As for that of a permanent court of arbitration, the immense scale on which it would have to be constituted, and the unnecessary expense of its maintenance, are sufficiently serious objections. More serious still, perhaps, is the impossibility of imagining any reasonable principle on which its proceedings could be conducted. The fertile brains of Irishmen have, indeed, devised not a

few schemes supposed to be capable of meeting the difficulty, the best known of which is that which obliges the landlord, if he raises the rent, to give the tenant the option of departure, with compensation at so many years' purchase of the higher rate; and the tenant, if he demands a reduction to depart, accepting compensation at so many years' purchase of the lower. No doubt this is a sufficiently ingenious adaptation of the principles of the last Land Act; but it is decidedly complicated; it is calculated rather to unsettle existing tenants in their holdings than to "root" them in them, as the phrase goes; and, above all, it is impossible to believe that it would substitute peace for war in the relations of landlord and tenant. It ought not to be forgotten that one of the main reasons of the unpopularity of the late Lord Leitrim was that he had spared no expense in buying up and extinguishing the burdens which the Act of 1870 had imposed on his property; and it is quite certain that any proprietor who attempted to exercise proprietary rights in the manner contemplated by the plan just mentioned would find himself denounced as an exterminator.

The truth is that the only possible means of arriving at fair rents is the simple process of free contract. It is indeed alleged—and there is, it may be at once admitted, a great deal of truth in the allegation—that the land hunger of the Irish peasant induces him to bid for farms to such an extent that the price of them in the open market is the very reverse of fair. The principle of these biddings frequently seems to an astonished spectator to be that of the pig-packer famous in story, who always stowed the unlucky animals until the vehicle contained as many as it possibly could hold, and then put in one pig more. This identical gentleman would, no doubt, have bid for his farm every penny it could possibly be made to produce, and then a pound, or ten pounds, or a hundred pounds more. But, in the first place, it is a mistake to suppose, as is frequently supposed, that this ferocious eagerness for land-holding plays into the hands of rapacious landlords in any manner which would be removed by Fair Rents. On the contrary, it is pretty easy to prove that almost any possible arrangement of valued rents would only make the matter worse. For the compensation which the landlord would have to pay according to the scheme alluded to above—the only scheme which can be said even to breathe an atmosphere of workableness—would obviously come in time to be paid by the incoming tenant as a kind of fine, and the process of rack-renting would go on more merrily than ever. Indeed, all schemes of Irish resettlement seem to overlook the unmistakable and hopeless fact that there are too many people in Ireland for any plan of making a livelihood which has commended itself, or is likely to commend itself, to the Irish mind. All the well-meant talk about waste lands, all the chatter about peasant-proprietary, cannot (save to eyes wilfully blinded) obscure the fact there are not in Ireland waste lands capable of cultivation in quantity sufficient to give adequate farms to the population, that a peasant proprietary cannot subsist without economical conditions which are not present, and that, therefore, any plan—even the three F's, or a perpetual Griffith's valuation pure and simple—would only stave off discontent and distress without doing away with their causes. The tenants now in the occupation of adequate holdings would no doubt flourish exceedingly at the expense of their landlords. The tenants now in the occupation of inadequate holdings would not only be no better off than they were before, but would be, so to speak, restrained by law from clearing out and making way for fewer, if not better, men.

There are, however, few moderate critics who will not allow that, if any further sop is to be thrown to Ireland, which seems to be a foregone conclusion, it is with a view to the second F that such a sop had best be concocted. Although the disturbance of tenants in their holdings has, no doubt, been grossly exaggerated, it does exist, and there is no doubt that in some cases it is caused by the exaction of an unduly high rent from the old tenant, and the hope of being able to exact an unduly high rent from the new one. If this could be put a stop to, it would be well, but when it is impossible to see how a stop can be put to it. Compensation for disturbance is almost the only way, and this is in a considerable number, perhaps a majority, of cases rather more unfair to the landlord than fair to the tenant. Valuation schemes suffer from the inconveniences already noted, and as for arbitration, what proportion to the fee-simple value of Paddy O'Rafferty's five acres of bog in Mayo would the cost of the proceedings requisite to ascertain the fair rent for the said bog be likely to bear? The cultivation of waste lands is good, as increasing the supply of land; emigration is better still, as decreasing the demand for it; and in these two things are probably to be found the only really legitimate and wise means of bringing about fair rents. Beyond this it is dangerous to go; yet if it is absolutely necessary to advance further, the extinction of yearly tenancies, with a right of increasing the rent, is perhaps the safest expedient. A seven years' lease is a much better thing than seven years' compensation, because it robs no one, encourages industry rather than idleness, and interferes only infinitesimally with proprietary rights. Seven years, of course, would be rather too short for agricultural purposes, but that is a matter of detail. The point to insist on is, that emigration, vigorous steps taken in the direction of cultivation of waste lands and drainage of boggy districts, and, lastly, as a possible thing, the encouragement of long leases, make up not only the fairest way of meeting the demand for fair rents, but the way most likely to lead to such success as is possible.

AERIAL NAVIGATION.

DR. POLE'S article on this subject in the current number of the *Fortnightly Review* has probably surprised and pleased many readers. There is always something fascinating in the idea of aerial navigation, and it must have been gratifying to find that a well-known man of science was of opinion that it was possible to steer almost any desired course through the air. Dr. Pole does not, it is true, go so far as the enthusiastic members of the Aeronautical Society, on whose proceedings we lately commented. He does not propose to fit man with wings, though he thinks it by no means impossible that some day an ingenious inventor may be able to accommodate his fellow-creatures in this fashion; but he does propose to make a great step in advance of anything hitherto achieved, and to render balloons dirigible—to use his own word—so that under ordinary circumstances it will be possible to travel through the air in well-nigh any direction. That this delightful result may be obtained he is all but certain, for he states that there "is nothing to discourage the idea" of practical aerial navigation, "except what we may hope would give way before skill and experience," and he apparently considers that the problem would have been solved long ago if intelligence and ingenuity had been brought to bear on it. Unfortunately the world has been sadly apathetic. "People have made up their minds," he says, "that a balloon can only float in the atmosphere, being carried passively along by any current that may happen to prevail." This view Dr. Pole regards as little better than superstition, and he must have carried the sympathies of many readers with him in his attempts to demolish it. Whether he has demolished it is a very different question. Undoubtedly there is something very charming in the prospect of real aerial navigation, and it may seem ungenerous to say anything in the least calculated to damp the ardour which Dr. Pole's bold speculations are likely to arouse, or to insinuate that they are, in no small degree, fantastic; but at the same time it is as well to look at both sides of the question, and when a writer promises such marvellous results as Dr. Pole foreshadows, it is certainly advisable, before putting faith in his alluring predictions, to examine with some care the grounds on which they rest. He is of opinion that a balloon can be devised which, "in light and moderate winds, under thirty miles an hour, which the Greenwich observations show to prevail all the year, with the exception of a few days," will be able to "travel in any direction, the speed varying from five to nearly sixty miles an hour." This certainly will be a marvellous result for modern science to achieve; and, if Dr. Pole is right, the engineers and mechanicians of the present day have an opportunity which they would be purblind to neglect. Nothing can be conceived more likely to fire the imagination of an inventor than the idea of such a balloon as Dr. Pole speaks of; but it is to be feared that, when the arguments by which he supports his very pleasing views are analysed, no small disappointment will be felt. There is a terrible amount of work to be done before the marvellous balloon can be sent rushing through the air with its cargo of delighted passengers. Some men of science in our day are, like many modern politicians, singularly enthusiastic; and in this case it is difficult to avoid the conclusion that Dr. Pole's enthusiasm has got the better of his judgment, and that he is a visionary rather than a mathematician, contending what he hopes for with what can be shown to be possible.

In the first argument, indeed, which he brings forward in support of his views the influence of enthusiasm is apparent. He says:—"Considering the vast development of mechanical invention and enterprise that has taken place in the last century, it is singular that so little serious attention should have been bestowed on the balloon. The brilliant invention of Montgolfier and Charles, from which so much was expected on its first appearance, has been hitherto little more than a toy: the attempts to take advantage of it for any useful object have been but few, and of very limited scope. Balloons have been used to provide elevated posts of observation for military purposes, and they have also served to aid the investigation of meteorological phenomena; but otherwise little or nothing has been done with them." And the inference which he proceeds to draw is that, if the subject of aerial navigation had received the attention it deserved, a great deal would have been done with balloons. It is strange that so able a man should not see that there is another and much clearer inference to be drawn from the facts which he states. Is it not almost absurd to suppose that in a century remarkable for the extraordinary progress of invention, engineers, mechanicians, and men of science have all of one accord neglected so fascinating a subject as aerial navigation? Seeing what fame and profit would be reaped by those who could make the navigation of the air practicable, is it possible to believe that inventors of all degree have been smitten for a hundred years with common blindness, and have neglected what was indubitably well worthy of their attention? Is not the fair inference from the facts just the opposite of that which Dr. Pole appears to draw? May it not be fairly assumed that this subject, so little likely to be neglected, has not been neglected, but that the problem has not been solved because its difficulties have been found to be insuperable; that it has been examined by capable men, but given up as hopeless, and that balloons have remained mere toys because investigation showed that there was no chance of making them anything else?

This undoubtedly is the inference from the facts adduced by Dr. Pole, the real meaning of which he so strangely overlooks; but still it is only an inference, and, though a very strong one, not

necessarily conclusive. Moreover, it is but fair to say that there were exceptions to what Dr. Pole considers as the general apathy, and that, during the century which has elapsed since the time of Montgolfier, two men of considerable mechanical skill have endeavoured to make balloons dirigible. Their efforts are duly recorded by Dr. Pole; and certainly, if they did what he believes them to have done, it is at once curious that there should have been so much carelessness with regard to balloons on the part of men of science, and very likely, to say the least, that balloons can be made dirigible. We fear, however, that here again a strong and almost irresistible inference is against Dr. Pole; but, before pointing this out, we must state what these two inventors are supposed to have achieved. The first in order of time was M. Henri Giffard, a French engineer, who in 1852, seventy years after Montgolfier's great experiment, ascended from the Hippodrome in Paris in a balloon which he had devised. It was, according to Dr. Pole, of elongated shape, pointed at the ends, nearly 40 ft. diameter in the middle, and 144 ft. long. It was steered by a large triangular sail attached to the end of the car, and motive power was obtained by a screw 11 ft. in diameter, turned by a steam-engine of three horse-power. The success attained in this daring ascent was, it seems, complete. Dr. Pole says:—

Having arrived at a convenient height he [M. Giffard] started his engine; and what was his delight, on pulling one of the cords of the rudder, to see the horizon begin to turn round like the moving picture in a diorama! The machine was really "under way": it was being steered like a ship at sea. In short the balloon was "dirigible," and the problem of aerial navigation was practically solved. The wind was too high for him to hope to move against it, but he performed with perfect success several manoeuvres of circular movement and lateral deviation. He descended safely, and he found, when he came to calculate his course, that his engine and screw had impressed on the balloon an independent velocity through the air of from 2 to 3 metres per second, or $\frac{1}{4}$ to $\frac{1}{2}$ miles per hour.

Certainly, if this account is accurate, M. Giffard achieved wonders, and made perhaps the greatest step that has ever been made in practical science. This marvellously successful experiment created, Dr. Pole says, a great sensation, and deeply impressed that remarkable scientific authority, M. Victor Hugo. Yet, strange to say, nothing followed it. M. Giffard, with the atmosphere at his command, did not pursue his investigation further, and his experiment utterly failed to rouse the ardour of other inventors, French, English, or American. For eighteen years, seemingly, no attempt was made to render balloons dirigible. The learned and unlearned alike placidly ignored the path through the skies which had been pointed out to them. In 1870, however, interest in the subject revived owing to the large use made of balloons during the siege of Paris. M. Dupuy de Lôme, the well-known French naval architect, set to work to ascertain whether it might not be possible to direct the course of balloons; but owing to various circumstances, his labours were not concluded till the beginning of 1872, when he ascended from Vincennes in a balloon which much resembled that of M. Giffard. It was 120 feet long by 50 feet diameter, with a screw of 30 feet diameter which was turned by four men. Two crews were taken aloft in the experimental ascent, in order that the severe work might not be continuous. The experiment was, it seems, entirely successful. Dr. Pole says:—

Thus equipped, he [M. de Lôme] ascended from Vincennes on the 2nd February, 1872. The wind was blowing strongly, but by putting the head of the balloon at right angles to the current, and working the screw, he produced a deviation which, when afterwards calculated, showed a resulting velocity through the air of upwards of 5 miles per hour; when the eight men were all working together, the velocity was 6.4 miles per hour. The behaviour of the balloon, in respect to stability and ease of management (which had caused the most anxiety), was all that could be desired.

Here again, as in M. Giffard's ascent, a marvellous result seems to have been obtained, but in both cases the question is, whether the records given are to be implicitly accepted. In expressing some scepticism with regard to them, it is scarcely necessary to say that we do not wish for an instant to question the good faith of either of the distinguished Frenchmen who endeavoured to navigate the air. That they thoroughly believed everything they stated no one can doubt; but all who have studied the history of invention know how inventors deceive themselves, how very honourable and very able men exaggerate the results they have achieved. What was remarkable in this case was the velocity obtained through the air by means of a screw—that is, the velocity independent of the wind. Rightly to measure this velocity must have been enormously difficult, and it can scarcely have been possible to avoid all chance of error. It is to be observed that M. de Lôme, with eight men, or rather less than one horse-power, attained nearly the same speed as M. Giffard with three horse-power, notwithstanding the fact that his balloon was decidedly inferior in shape. This alone is sufficient to throw great doubt on the figures given, which at best can only be accepted as conjectural. Certainly the scientific world and mechanicians in general seem to have so considered them, for M. de Lôme's experiment produced no more lasting impression than M. Giffard's had done. There was, again, the same conspiracy of silence. No inventors took the matter up. The French Government, which had instituted the experiments, did not, in spite of the marvellous result attained, care, seemingly, to carry them any further, or attempt to equip dirigible war-balloons. The German Government, generally thought to neglect nothing relating to warfare, showed the same strange apathy, and made no effort to utilize M. Dupuy de Lôme's experiments. It is certainly most

singular that Governments and the scientific world alike should so persistently ignore very remarkable facts, but it seems absolutely astounding when the deductions to be made from these facts are considered. Dr. Pole considers that a balloon could be constructed which would have an independent velocity of thirty miles an hour. This conclusion he bases on M. Dupuy de Lôme's experiments, and on his reasoning with regard to aerial navigation. Of a balloon which would attain this pace he gives a short description, which we venture to think is one of the most remarkable ever submitted to the public by a man of science. It should, he says, be 370 feet long with a maximum diameter of 100 feet, and with an engine of 300 horse-power would be able to carry fuel for four or five hours' consumption, and 100 passengers with their baggage. This is wonderful enough, but marvels do not end here. Dr. Pole, when he gives his balloon the pace of thirty miles an hour, is of course only speaking of pace in an absolute calm. The first question which suggests itself is, what will be the pace of the balloon when the wind is foul? How will it, as a sailor would say, beat to windward? Dr. Pole is quite ready with an answer. He sets out a table showing the speed of the balloon on courses at various angles with the direction of the wind, and with various velocities or forces of the wind. Of these courses it will be sufficient to give two as showing what the balloon of the future is to achieve. With a north wind travelling at a velocity of ten miles an hour, the balloon will sail along a N.N.E. course, or within two points of the wind, at the rate of twenty miles an hour; and along a N.E. course, or within four points of the wind, at the rate of twenty-two miles an hour; and it is to be observed that these are true courses—that is to say, that the leeway caused by the wind is fully allowed for. If, then, Dr. Pole is correct in what he considers as undisputable conclusions from established facts, balloons can not only beat to windward infinitely better than the fastest sailing ships, but they can even surpass steamers. Not only is the problem of aerial navigation solved, but something like perfection is attainable at once; and, though this has been evident for some time past, men of science have persisted in ignoring the facts which point to so marvellous a result.

THE RISE IN THE BANK RATE.

SINCE the beginning of December the Bank of England has twice raised its rate of discount, first on December 9 from 2½ to 3 per cent., and last week again from 3 to 3½ per cent. This is evidence, in banker's phrase, that the value of money is rising; in other words, that the interest payable for the use of money is higher than it was two months ago. The fact, at first sight, seems inconsistent with the opinion we expressed some little time ago, that the permanent value of money is falling, as evidenced by the high prices of all kinds of Stock Exchange securities. For the past two years Consols have been very nearly at par, and quite lately they actually passed par. The United States Government, again, is proposing to borrow at par at 3 per cent., and the Indian Government has actually raised a considerable sum at 3½ per cent. Even such Governments as those of France and Russia, though exposed to enormous political dangers, see their bonds rising steadily in the market. And if we pass from the securities of the great Governments to the stocks of railways or other industrial associations, we find still the same kind of evidence. All this is proof that the permanent value of money is falling; in other words, that an investor cannot expect in the future to receive as large a return for his money as for several years past he has been accustomed to look for. How, then, does it happen that while, in one respect, the value of money is thus falling, in another, as we see by the advance in the Bank rate, it is rising? In reality, there is no contradiction between the two sets of phenomena. The funds in the short loan market—that is to say, in the market for discounts and short loans—mainly consist of the deposits in banks; that is to say, of money which is lent to banks only for short periods, either while the owners are looking out for eligible permanent investments, or while, for some purpose or other, they are keeping money ready to their hand should a demand for its use arise. This fund, from the nature of the case, is not very largely and immediately increased. But the fund available for investments is constantly being increased by the growth of population and wealth, and by the accumulation of savings. It is quite evident that in all advancing countries like our own the surplus savings, after providing for the extension of businesses of all kinds, must amount every year to enormous sums; and the greater part of these sums is invested in Stock Exchange securities. Evidently, therefore, the prices of these latter must continue to rise, unless safe and eligible securities are newly created as fast as the savings thus accumulate; but for several years past now first-class securities have been created very sparingly. Indeed, if we except the great French loans on account of the war, there have been scarcely any first-class securities created of such magnitude as to affect the market. On the contrary, there has been a steady and constant decrease, both in our own country and in the United States; while railway building and other forms of industrial investments have also not been large. For this reason the permanent value of money must tend to fall until, in consequence of a great and long-continued war, or of some other circumstance causing vast issues of new Stock Exchange securities of high class, fresh securities be created large enough to absorb, for several years, the surplus

savings of the more advanced countries. But this fall in the permanent value of money may go on for a considerable time without very much influencing the value of money in the short loan market. In the long run, no doubt, if the value of money in the short loan market were to rise, people would sell out of Stock Exchange securities, and employ the proceeds where they would bring them a good return, and would thus bring down the value in the short loan market to the same level as in the long loan market; but it is obvious that this is not to be done on a large scale unless it becomes quite clear to investors that they would be able to employ their money advantageously for a sufficient time to repay them for selling out of permanent investments which they had made.

The main cause of the rise in the value of money in the short loan market is the revival in trade. As our readers are now well aware, that revival began in the United States, and there it has up to the present made by far the greatest progress. Four successive bountiful harvests, with the insatiable demand for their produce in Europe, have enriched the people of the United States and given the farmers money to spend in any way they please, and have stimulated, in consequence, all kinds of enterprise in the country. The farmers, having larger incomes and larger crops, have had of course to employ more labourers at better wages, and therefore have been obliged to keep in hand larger sums of money to pay wages, both for sowing and getting in their crops, and for carrying them to market. The purchasers, again, have needed more money to buy these crops and transport them from the west and south to the Atlantic ports. The labourers, having larger wages, have larger surpluses to spend with the butcher, the baker, the draper, and the bootmaker, and, in consequence, these latter have had to keep larger stocks of trade and larger sums for small change; while, in their turn, they, making larger profits, have been able to increase their own expenditure. Thus throughout the whole commercial community there has not only been a larger amount of business done, but there have been larger sums of money demanded to turn over that business. The result has been an enormous increase of the currency of the United States. For a couple of years before resumption was actually carried into effect, the United States accumulated the whole yield of the mines of their own country. Since resumption they have continued to do the same, and they have also required an immense import of gold from Europe to supply the demand for additional currency to which we have been referring. In 1879 the export of gold from England and France to the United States amounted to about 15 millions, and not a penny of this has since been returned. Last year, again, about 14 millions more were exported, and it is extremely improbable that any of this will come back very soon. Thus about 29 or 30 millions in gold have in the course of about a year and a half been taken from Europe, chiefly from England and France, for the United States. In consequence, the chief banks here—more particularly the Bank of France, and to a less extent the Bank of England—have seen their stocks of gold run down very seriously. At the end of last July the Bank of France held about 30 millions in gold. Last week the stock had fallen to less than 22½ millions. Thus in a little over five months the Bank of France lost over 8 millions of gold, and the Bank of England lost about 5 millions. If the Bank of France had been governed by purely commercial considerations, it would early last autumn have raised its rate of discount so as to stop this drain of gold; but, for political reasons, it failed to do so; and the result was that money continued artificially cheap throughout the autumn, and consequently that the United States were able to continue drawing away gold to the immense amount we have just stated. But, in the end, the drain began to tell upon the reserves both of the Bank of France and of the Bank of England; and the latter institution in little more than a month has raised its rate from 2½ to 3½ per cent. The outside market, too, has followed this movement, and the real value of money in the short loan market of London is now very little below the official Bank of England rate; in fact, the great joint-stock banks are very poor in market phrase—that is to say, they find themselves with very small available funds, either for lending or discounting, and the supply being small its value tends to rise.

Just as the revival of trade in the United States caused an extraordinary demand for additional currency, so the improvement here at home is gradually also causing a demand, not to anything like the same extent as yet, but in a manner that is likely to go on increasing. As the number of workpeople taken on increases, and still more as wages rise, and with wages prices, the amount of money necessary for paying wages and purchasing for the ordinary current purposes of life will need to be greatly enlarged. This increase in the money in circulation will draw away some part of the resources of the various banks. These, moreover, will find an increasing demand from manufacturers and traders generally. Every man who sees his profits increasing will desire to extend his business in some way or other, and therefore will need additional credit. But additional credit can only be obtained, when it is demanded by a great number of people at once, by paying higher for the accommodation. Thus every step in the improvement in trade tends to enhance the value of money, and we may expect to see the rates fully maintained during the present and next year, should nothing occur to check the improvement which is in progress. No doubt this rise in the value of money in the short loan market will have the effect referred to above—that is, it will induce many persons, and more particularly bankers and the larger capitalists, to sell out

investments which they held through the late depression, because of their inability to employ the whole of their funds profitably in their proper business as bankers, for the purpose of employing proceeds in the short loan market. This will tend to equalize the value of money in this and in the investment market. The large sales will tend to check the rise in the price of securities. The employment of the proceeds in the short loan market will tend to depress the value of money there. Besides, as profits become larger and savings accumulate, some portion of the savings that would otherwise be permanently invested will be used in the short loan market, in which for the moment the return will be larger; and this again will still further depress the value of money in the short loan market. But this will not come into effect for some time yet, or, at least, though it is no doubt already beginning, it will not check the rise in the value of money caused by the great improvement in trade. The enormous exports of gold to the United States to which we have referred have left the metallic reserves of the Banks both of England and France so low that these banks necessarily must guard the reserves which they still retain by keeping up the high rate of money: and they will be enabled to do this effectually by the improvement in trade which is going on. In the long run, of course, the rise in the value of money, in wages and in prices, will bring about the reaction which always follows a great expansion in trade, and a period of depression will recur, when the value of money in the short loan market will once more fall, and will tend indeed to become less than in the market for securities; but for the moment the tendency now is for the value of money in the short loan market to exceed considerably that in the market for investments. The influence of the great exports of gold to the United States, of which we have spoken, has been greatly enhanced by the falling-off in the yield of gold from the mines. Practically for about four years Europe has received little or no gold from the American mines, and the produce of the Russian mines has been absorbed in Russia itself and in Germany. Western Europe, therefore, has had to depend almost entirely upon its old stocks and upon the yield of the Australian mines; but the Australian mines have been growing less and less productive for several years past. Unless, therefore, new mines are discovered, or the gold-using countries adopt new methods of economizing coin, or silver comes into more general use than seems at all likely at present, the time appears to be approaching when the scarcity of gold will have a serious effect upon the money markets of the world. It would be waste of time to speculate on the probability of new mines being discovered, or new methods of economizing coin coming into use; and at present there does not seem much likelihood that silver will come into more general use. On the contrary, even Italy talks of resuming in gold, not silver; and it appears to be settled that Russia also, if she is able to carry out her resumption plans, will adopt a single gold currency.

ITALIAN MASTERS AT BURLINGTON HOUSE.

FOR the purposes of methodical study the present collection of the works of Italian masters must be pronounced inferior to many of its predecessors. There are some admirable examples taken singly both of the earlier and the later schools; in one or two instances, thanks to the liberality of Lord Cowper, we are allowed the opportunity of enjoying at our leisure pictures of world-wide fame that have hitherto been accessible only to the few; but, taken as a series, the Italian pictures miss that element of historical continuity which has at other times lent a special interest to these exhibitions. The painters of the fifteenth century who are here represented are, with one or two exceptions, not those who exercised the most powerful influence in forming the style of their successors; and where these greater names find a place in the catalogue, the works attributed to them are either of doubtful authority or of insufficient importance. The "Virgin and Child" (182), assigned to Piero della Francesca, gives but a very inadequate impression of the genius of this gifted artist. Nor from the little portrait (186) said to be by Masaccio would it be possible to appreciate the commanding position which he held in the gradual development of the Florentine school. In some cases the association of a great name with an indifferent performance is altogether misleading. The "Ecce Homo" (188), lent by Sir William Abdy, is a genuine and very interesting work of its kind, and it bears evident traces of Mantegna's influence; but it would need far stronger evidence than is afforded by the signature to justify the conclusion that Mantegna himself had any hand in its production. The question here can scarcely be said to admit of a doubt, for it depends not on minute and disputable points of technical method, but upon the essential quality of an artist's mind and invention. Mantegna may at some early stage of his career have displayed equal immaturity of power; he could scarcely, even in his earliest youth, unless he were copying the work of another, have made a design so entirely inconsistent with the known intellectual tendencies of his art. His imagination led him always to the simplest form for expressing his idea. He possessed a strong grasp of character, and he could realize the full dramatic force of any subject he chose to present; but he concerned himself only with the essential facts in either kind, and he never sought to enrich his design by the rendering of useless detail. The author of the picture belonging to Sir William Abdy exhibits a talent of quite another order. He has employed a

fruitful fancy in furnishing the scene with abundant incident, that owns but little relation to the central idea; and he has spent the best of his labour in the minute realization of unimportant accessories of architecture and landscape. In these respects he reminds us of Basaiti, who in the early part of his career worked under the influence of the Muranese manner, and who preserved to the last a fondness for the picturesque aspect of ruined fragments of building such as may be found in the picture before us. But it would perhaps be rash to offer more than a conjecture as to the real authorship; for there are several of the less-known painters of North Italy to whom such a work might probably be assigned, and the only thing that can be confidently stated is that it is certainly not by Andrea Mantegna. Sir William Abdy sends two other Italian pictures that will also arouse discussion. In the catalogue they are both set down to Francia, and the first is said to be a portrait of the painter himself. It is highly improbable, however, that they can both be the work of the same hand, and it is at least doubtful whether either of them belongs to Francia. The one (192), a head of strong individual character, painted in fair tones of colour, and showing in the mode of its execution a fine feeling for design, at once suggests the name of Antonello da Messina; the other, with its greater force of chiaroscuro, points to the practice of the Milanese school, and seems to justify the conjecture that it is the work of Andrea Solario.

Among the interesting records of an earlier phase of Italian art are to be reckoned the fragments of fresco assigned to Giotto which come from the Roscoe collection at Liverpool. To the same series belong the noble heads of the Apostles in the National Gallery. These fragments were seen from the walls of the church of Santa Maria del Carmine in 1770, and they constitute, with the engravings of Thomas Patch, almost the only record remaining of Giotto's labours in this church, which was destroyed by fire in 1771. Messrs. Crowe and Cavalcaselle throw some doubt upon the assumption that they are genuine examples of his work, and are disposed to assign them to one of his followers; but the "Daughter of Herodias" (226), in spite of the damaged condition of the painting, reveals qualities that are not unworthy of Giotto's reputation. Beside these first essays of the Florentine school hangs a large composition of the "Virgin and Child with Saints" (222), which may be taken to illustrate the starting point in the progress of Venetian painting; for, although it is dated as late as 1472, it does not mark any advance upon the practice of the Muranese artists in their earlier efforts. The subsequent growth of the Venetian school may be traced in the two examples of Cima da Conegliano, lent by Mr. Butler, and in the "Virgin and Child" (232), ascribed to Vivarini, which is contributed by Sir Frederick Leighton. Several pictures attributed to the greater masters of Venice do not, in all cases, carry a conviction of their authority. A small "Virgin and Child" (141), set down to Titian, has nothing to recommend it but its signature. A larger and more important composition from Lord Strathford's collection (149) is undoubtedly a genuine example of the Venetian school, but its general character suggests the name of Bonifacio rather than Titian. There is direct evidence, indeed, for giving to Titian the group of portraits of the three children of King Ferdinand of Austria (213), lent by Lord Cowper. We have the artist's letter dated 1548 in which he announces to his patron the speedy completion of the work; but it is to be observed that Titian's latest biographers assume that he only gave the finishing touches to the painting, and that it was in great part executed by another hand. Sebastian del Piombo is only half a Venetian, for he borrowed the essential principles of his style from the practice of another school. Of the two pictures bearing his name in the present exhibition, one, a portrait of Vittoria Colonna (214), is in a state that renders it difficult to form any confident opinion of its worth. If it has once been a genuine painting, it must have gravely suffered at the hands of restorers. The other, a noble male portrait (205), lent by Mr. Baillie Hamilton, is in every way worthy of the painter's fame. It ranks among the very best examples of Italian portraiture in the gallery, and the grand pose of the figures, with the simple arrangement of the black brocaded robe, prove beyond question that it is the work of a man who possessed a sense of style in design, such as might be expected from an artist who had served under the leadership of Michael Angelo. Beneath it hangs a very interesting Venetian picture (206) assigned to Giorgione, and in the next room we find a portrait (156), lent by Lord Strathford, which also bears the name of this master of Venetian masters. In the latter, however, it is impossible to detect any of the characteristics of Giorgione's style. The type of the face and the pose of the figure recall the manner of Paris Bordone, but there has been so much repainting that it is perhaps scarcely worth while to speculate upon the question of its authorship.

In the Third Gallery are placed some of the most important specimens of Italian art. The two Madonnas of Raffaele, the portraits by Andrea del Sarto, and the large decorative compositions by Paul Veronese, make up a notable group of genuine and characteristic examples. The larger Raffaele (152) is interesting, not merely for its intrinsic beauty, but for the evidence it affords of the complete independence of his genius at this early stage of his career. It bears the date of 1508, when the painter was no more than twenty-five years of age, and yet it asserts even more clearly than the famous Borghese picture of the Entombment, executed in the previous year, the new direction which religious art was about to take under

Raffaele's leadership. In this group of mother and child, combined with such exquisite grace of line and spontaneous truth of movement, there is but slight trace left of the earnest devotional spirit which is to be found in the earlier painters of Florence, and even in the work of Raffaele's master, Perugino. The force and fascination of the picture lie not in any new perception of the religious aspect of the subject, but in a deeper and more liberal understanding of the purely natural relation of mother and child. There is on this side a refinement and delicacy of observation such as painting had never before attained, and has never since surpassed or even equalled. The action of the child's hand, the look of innocent laughter upon his face, and the contrasted expression of repose upon the countenance of the mother, belong to a kind of beauty in art that Raffaele was the first to discover or to display. Such an achievement marks a new departure in the study of nature, and points to a growing consciousness in the artist that there lay a wide field for the exercise of his genius beyond the limits that had been assigned to it by the requirements of the Church. The smaller group of the same subject (148) is not of equal beauty, and its effect is marred by partial restoration. Of the portraits by Andrea del Sarto, the finest is that which is assumed to present the likeness of the painter himself. The half-length of a lady (159), if it was ever finished, has since suffered considerably, but even in its present imperfect condition it impresses the spectator by the grand disposition of the drapery and by the noble carriage of the head. The face is of a type that constantly recurs in Andrea del Sarto's drawings, and is in all probability the likeness of the painter's wife.

REVIEWS.

INDIAN DESPATCHES OF THE DUKE OF WELLINGTON.*

MR. OWEN has rendered good service to all candidates for civil or military employment in India as well as to the general reader, by this selection from more than half a dozen volumes of the despatches published by Colonel Gurwood or by the present Duke of Wellington. To this task Mr. Owen brings a good knowledge of Indian history, and some local experience acquired when serving in the Educational Department under the Government of Bombay. His selection of papers is judicious; his arrangement perspicuous; and the study of the work is materially helped by an introductory essay of some ninety pages, in which he discusses the policy of the Marquess of Wellesley towards the native Powers, and the character of his more illustrious brother. Yet it is impossible not to be struck with sundry blemishes or rather omissions, which a little more pains would have enabled the author to supply. If there is any occasion on which short editorial notes are required it is in the publication of a correspondence of an eminent public servant, which embraces an immense variety of subjects and ranges over a period not within the recollection of any living statesman. It may, no doubt, be pleaded that the Duke's style is so clear and coherent, his aims are so transparent, and the topics discussed are so interwoven with history, its wars, sieges, and treaties, that few explanations or additions are necessary. This, in one sense, is all very true. Nobody can wish to add to or take anything from Wellington's clear and concise diction. But when in India, during a period of nearly eight years, General Wellesley was in constant correspondence with the foremost civilians and soldiers of the day; and at no period of its history did the East India Company produce men more eminent, if not in making Revenue Settlements and drafting Codes, at least for diplomatic talent and skill in negotiating treaties and cessions. Amongst other correspondents, General Wellesley was constantly writing to Munro or to Malcolm, to Kirkpatrick or to Clive. Rarely, if ever, does Mr. Owen recollect to give at the head of each letter the official designation of these and numerous other officials. A practised student of Anglo-Indian history may possibly recollect that Mr. Such-a-one was restraining Scindia, that this able Colonel was "educating" the Nizam, or that this gifted Major was expounding to the Peshwa the utter absurdity of a Mahratta confederacy against such powerful enemies as the British. In some instances the position of the correspondent can be gathered or guessed from the context of the letters. But sudden changes are constant in the Indian official world, as Mr. Owen well knows; the threads of the diplomatic web are crossed and intertwined; now and then two officers are deputed to the same chief or prince, but in very different capacities; and the greater and more extensive the range of the topics, the more important it is that the reader should see at a glance the exact position which was filled by each Commissioner, Agent, or Resident. As illustration, we observe that during a considerable portion of these years the following gentlemen were filling posts of the very highest importance. Josiah Webb was Secretary to the Government of Madras; Colonel Palmer was at Poona, with the Peshwa; Mr. Lumsden and Mr. Scott were in Oudh; Colonel Collins was at Gwalior; the post of Resident at Hyderabad was filled first by

* A Selection from the Despatches, Memoranda, and other Papers relating to India, of Field Marshal the Duke of Wellington, K.G. Edited by Sidney J. Owen, M.A., Reader in Law and History and Tutor at Christchurch, Reader in Indian History, Oxford, formerly Professor in the Elphinstone College, Bombay. Oxford: Clarendon Press. 1880.

Colonel Kirkpatrick, who afterwards became Military Secretary to the Government of India, and then by Captain Kirkpatrick; Colonel Stevenson commanded the Nizam's contingent; General Stuart was Commander-in-Chief at Bombay. The troops in Upper India were under Sir James Craig, who is heard of, amongst other places, at a station called Anupshire, not very far from Meerut, of which hardly anything remains but the neglected tombs of officers who died there. Malcolm was at one time Town Major at Madras, was then Assistant Resident at Hyderabad, and was subsequently sent on a special mission to Scindia's Court. Mr. Uthoff was Commissioner in Malabar. Five Commissioners—Lord Harris, Colonel W. Kirkpatrick, Barry Close, Henry Wellesley, afterwards Lord Cowley, and Arthur Wellesley himself—were entrusted with affairs at Seringapatam after its capture. Some, but by no means all, of the above additions can be extracted from the present volume. It was the duty of any editor, especially of one who has shown himself so capable in selection and arrangement, to have prevented any doubt or searchings of heart about these details. Also a few explanations might have been added of the less familiar Anglo-Indian terms. By *akbar* is meant a newspaper published in the vernacular. *Schbundies* are irregulars or a sort of militia. *Tannahs*, more usually *Thannahs*, are police stations. *Nerrek*, or *nirik*, is the current price of articles in the native bazaar. A *coule*, or properly *kaut*, is a written agreement, and in these despatches the word means articles of peace offered to chiefs and opponents. A *mutasaddi* is an accountant or a writer. *Dubashery* is a word coined for the nonce by Wellesley himself from *dubash*, an interpreter, or one who knows two languages, and means, from the context, trickery and deceit. Mr. Owen may probably be aware of the exact signification of these and other terms. It does not follow that English readers can be as familiar with them as they are now with *balshish* and *loot*.

Now for the despatches and their author. The introduction by Mr. Owen will enable the general reader to follow the course of war and diplomacy in those eventful times. The weak policy of Sir John Shore had been to play off one native Power against another. That of the Wellesleys was to crush Tippon, to render French intervention an impossibility, to break up the Mahratta confederacy, and to assert the supremacy of the British Power. How, with one brother in Council and the other in the field, these paramount ends were attained is a matter of history into which we are not going to enter. Our business is with the man who left India before he was thirty-six years of age, and who had then already proved himself to be a consummate general, a clear-sighted politician, and a successful administrator. Now it was all along well known that General Wellesley had the best rules of strategy at his fingers' ends, ready for application; that he seemed to divine by mere intuition the objects and wishes of his unscrupulous antagonists; that he wrote as if he had a detailed plan of every difficult country constantly before him, with its passes, ghats, forts, and bazars, as clear as it shown in a modern photograph; that he was fully as able to lecture a commissariat officer on the driest drudgery of his department as he was to tell a general of division how to bring his forces into line; that he knew how to avail himself of every favourable circumstance of climate or locality in preparing his combinations; and that in the art of war, which is said to be made up of blunders, he committed the fewest and left nothing to accident or chance. His impatience of jobbery and corruption, his sharp and incisive reproofs to men who preferred their own selfish objects to the service of the State, his anxiety to do justice to opponents from whom he had differed, his acute perception of character, the respect and veneration with which he inspired subordinates in the field or the Council, are points in his character which do not admit of controversy. But we suspect that, to many readers, this volume will be almost the first revelation of his signal talents for negotiation, government, and civil affairs. It is not too much to say that he displays an insight into native character, an instinct as to Oriental subterfuge and treachery, an appreciation of difficult problems likely to arise with the increasing responsibilities of cession and conquest, which would have done credit to the wisest of English statesmen, or the most trained of Indian administrators; to his brother the Governor-General, on the one hand, and to Lord Lawrence, Lord Metcalfe, Munro and Thomason, on the other. Mr. Owen pointedly draws attention to the unsparing criticism on Monson's discreditable retreat before Holkar in 1804. Sir Robert Peel quoted this as the best military letter he had ever read; and every subaltern, to borrow a phrase from Macaulay, has, or "ought to have it by heart"; while any civilian can make out that this incapable and ill-starred commander advanced into a country of which he was quite ignorant, retreated when he might have attacked, remained stationary when he ought to have continued his march, and inflicted on our arms a disgrace to which even Maiwand affords hardly a parallel.

To the officer who studies his profession and who now rises by merit and not by purchase, this volume must afford a series of valuable lectures. The probability of the French effecting a landing in India, or giving real help to Tippon, is decided. The description of the grand army marching to Seringapatam with the Nizam's contingent, the *brinjaries* or grain merchants, the bullocks, elephants, carts, "coolies and doolies," might for clearness and conciseness drive a Special Correspondent to despair. We observe here, without the slightest disparagement to General Roberts' recent splendid feats, that Wellesley repeatedly averaged seventeen miles a day; that even the Nizam's "rascallious" marched

twenty miles; that previous to Assaye our troops accomplished twenty-three miles in seven hours and a half, and that the rate of progress was then invariably three miles an hour; while, after Assaye and before Argaum, a march of one hundred and twenty miles in eight days enabled the General to save "all our convoys and the Nizam's territories," and to win the last battle, attacking late in the day, as his friend and disciple Lord Hardinge did, just forty years afterwards, at Perozeshah. A letter to Colonel Sartorius on the best way of making war in the jungles is pregnant with meaning and advice. This officer is warned against moving small bodies, however compact, in different directions against Nairs and such-like, who can do without baggage and hide in the dense forest or appear, just as they choose. The only way of dealing with these foes is to clear the road of jungle at whatever expense and time, push forward advanced posts when the line of march is cleared, and then, when the communications with the rear are secured, send out light detachments in all directions. The "success of military operations in India depends on supplies." There is "no difficulty in fighting, and in finding the means of beating your enemy with or without loss." Wellesley was never needlessly severe, much less cruel; but he tells Colonel Sartorius to give a hint to a troublesome fellow named Mousa, "who was supplying a hostile Raja with rice, that he was in the habit of hanging men who dealt treacherously while living under the protection of the Company." The objection to martial law, though often quoted, may as well be repeated here. "Military gentlemen in Malabar" ought to give their own definition of military law. "I understand military law to be the law of the sword, and, in well-regulated and disciplined armies, to be the will of the general." Nor was it clear to Wellesley how common questions and the common business of provinces could go on, if, when rebels could already be punished, all would be "referred to a military commanding officer, as in a camp, and would be decided upon military principles either by himself or his officers." Martial law, in fact, is the suppression of every ordinary tribunal. As remarkable as the power to conduct a campaign successfully is the reluctance to begin war without the clearest justification. A refusal of the Mahrattas to accede to a closer alliance was no justification, neither ought one country to make war on another because the latter may at some time form an alliance prejudicial to the interests of the former. Equal plainness of speech is shown in letters to the Governor-General, who is treated, though with respect, just like Colonel Stevenson or Major Murray. Lord Mornington had much better not join the army and hamper its commander, nor need he go to Seringapatam after its capture; but he ought at once to go to Madras, at the commencement of the Mahratta campaign, in order to obtain early intelligence and to keep the perverse Madras Government straight. On the other hand, great stress is laid on the presence of a Civil magistrate with troops when sent to put down rebellion. His business is "to re-establish Civil organization," to give confidence to the inhabitants, and to procure resources and supplies for the troops. In his absence nothing will be done. Villages will remain deserted, and the soldiers, deprived of supplies, will take to plundering the country. Military men who have conducted operations successfully in Upper India, or against the frontier tribes to the east of Bengal, may be somewhat surprised to learn that Wellesley thought the rainy season the best for operations in the Mahratta country. Certainly the black soil turned to mud, and was, now and then, impracticable for carriages and artillery. But the army would always get water; rivers, no longer fordable to the enemy, could be easily crossed by us with pontoons or the common basket boats; and other inconveniences were mere trifles. The memorandum from which these particular remarks are taken is a perfect text-book on military operations in a strange country, on the collection of supplies, on the defence of British or allied territory, and on the attack of forts. The young general who could provide for these and twenty more such contingencies might well be justified in telling the Nizam's Minister that he would beat all the Mahrattas in Hindustan, and feed his army even if it were to march to Delhi.

Our remaining space must be devoted mainly to those civil questions which are more within the province of a Governor-General. But there is abundant indication that, had the two brothers exchanged places, the soldier at least would have become not less eminent in the Indian Council than in the Mahratta field. That, dealing with wily and unscrupulous Mahrattas, he should have formed a low estimate of the native character is not surprising; but in all his intercourse with Vakils and Dewans, by letter or in conference, he is earnest and impressive, without being dictatorial; and we know that in Mysore, with which he was so long connected, two names are held in affectionate remembrance by natives to this day— one is Sir Mark Cubbon, the other is Arthur Wellesley. The young Hindu Raja who was replaced on the throne of his ancestors by the genius and policy of the Wellesleys only died in 1868, and we are now about to hand over his kingdom, enriched and civilized, to his adopted son. In the suggested treatment of the Bluecs Wellesley anticipated Outram. By conciliation and by avoiding interference we can make them our best friends. A contrary line of conduct did actually, until Outram's time, make them, in the words of a despatch to the Bombay Government, "our worst enemies." On the impolicy of employing troops to support the violent acts of native Governments these despatches are equally strong. Our soldiers ought not to be the agents of "little dirty *amildari* exactions." The state of public events in India was generally so advanced during the Wellesley administration that "neither the Court of the Directors nor the

King's Ministers were capable of taking an enlarged view. I doubt very much if there is any man in England who understands our present situation. I am certain Lord Castlereagh does not." For proof that Wellesley had grasped minute details as well as enlarged principles we need only refer to his letter on the differences between the Peshwa and the Southern jaghirdars. It is not the production of a military commander at all. It would have done credit to any of the foremost civilians of Lord Dalhousie's school. The same breadth of view, the same sound political insight, the same clear appreciation of the future, prompt his remarks on the difficulties and responsibilities of our Indian supremacy. Peace in Europe is no ground for diminishing the effective strength of the Indian army. A good administration may promote internal peace, but troops should be massed in large stations whence they can easily be moved and not frittered away in small detached posts. It is in no harsh criticism of Wellesley's genius that we select a few instances in which his judgment was at fault. He was in error in 1798, when he thought that we ought never again to be involved in a "country" or internal war, but might preserve peace by balancing the various Powers, or when he was half-inclined to cede the Province of Oudh to Holkar. But these and a few others are mere slips; and in what he says as to the impolicy of employing negro troops in the East Indies; on the propriety of having a regular establishment of bullocks for transport instead of hiring these animals; on the dangers of an indiscriminate admission of Europeans into the interior; on the necessity for roads and for the improvement of internal navigation; on the Company's monopoly of trade; on the taxation of the Bengal Provinces; on the importance of preventing communications between Native Courts and Continental Powers; and even on such modern questions as famines and their remedies, he either points out difficulties or suggests a line of conduct which the wisest and strongest of Anglo-Indian administrators might ponder with advantage. Then naturally comes the question, Whence did the Sepoy General gain this clearness of insight and this fecundity of resource? He had served no apprenticeship of statecraft in England. Between 1787, when he entered the army, and 1797, when he went to India, he had merely been sent here and there between Ireland and the Low Countries. He never entered Parliament till 1806, when he became M.P. for Rye, after his return from the East. But some rare men leap to light as statesmen and generals as others are born painters and poets. A generation which has arisen since Wellington's remains were fittingly laid under the dome of St. Paul's may possibly take some of its impressions of him from the diary of a cynical voluptuary or from the outpourings of a Radical press. But delay in the recognition of Roman Catholic claims, or an unfortunate utterance about the perfection of the British Constitution at a time when the nation was lawfully asking for reform and the extension of the franchise, ought not to be weighed against his splendid achievements and his high sense of duty. Rather do we hope that posterity may long be instructed by his justice, his manliness, his devotion to the Sovereign, his transparent sincerity, and his capacity for war and administration, when fanatical rhetoric and ignoble submission of principle to party and popularity shall either be mentioned with abhorrence or be clean forgotten.

MOLIÈRE.*

M. ARSÈNE HOUSSAYE was director of the Comédie Française under the Second Empire. It might, therefore, be presumed that he would write about Molière with some knowledge and authority. He does write with a lax and slipshod carelessness which makes his book as discreditable to French literature as it is honourable to the art of publishing in France. *Molière, sa femme et sa fille* is a beautiful folio, excellently printed on hand-made paper, and illustrated with etchings, engravings, tail-pieces, and ornaments in black and red. Some of the illustrations are reproductions—rather embellished, we think—of engravings in early editions of Molière's plays. The title-page is a copy of an interesting frontispiece of 1673, representing Molière in his two characters of Scapinelle and Mascarille. M. Housseye would have made a better choice if he had copied the frontispiece of the second volume of that date, which gave portraits of the comedian and his wife, crowned by the muse Thalia. Many other pretty engravings are said by M. Housseye to be reproductions of portraits of Molière. The originals are in M. Housseye's possession; but we see no reason to believe much more in their authenticity than in that of the too numerous so-called portraits collected by Solairel. We ask for the pedigree of the portraits, and M. Housseye offers no evidence.

The outward part and material form of M. Housseye's book leaves little to be desired. The portraits may not be authentic, but they are pretty. The copy in wax of "Molière's seal" (so called) on the fly-leaf would terribly damage the volume if it came to be found; but probably the wax might be removed by the application of a heated knife-blade. As we have said, the letterpress is unworthy of the engravings. The style has all possible faults; it is grating, flowery, empty, full of repetitions, and terribly tedious. Where we look for facts we find only grotesque mistakes and a tissue of inconsistent fancies. As the French critics seem to hold back from the task of exposing M.

Housseye's innumerable blunders, we intend to note a few specimens. M. Housseye's intention is to reconstruct, by the study of documents and the exercise of imagination, the inner life of Molière, especially the story of his relations with his wife. Armande Béjard M. Housseye calls an enigma, a Joconde, a thrice-masked coquette. Two points in her story have always invited the attention of the curious. First, who was Armande, and what was her parentage? Second, how did she behave to Molière; was she merely a coquette, or was she actually faithless?

As to the first question, the facts are really simple enough, though they have been confused, originally by the lack of documents, and afterwards by the prurient conjectures and scandals of French biographers. Molière was married on the 14th February, 1662, to Armande Grésoinde Claire Elisabeth Béjard, described in the contract of marriage (23 January, 1662) as daughter of Marie Horré, widow of the late Joseph Béjard. This Béjard died early in 1643, and his widow, Marie Hervé, renounced his succession for herself and for her children. Two of them are falsely described as minors, and among these children there is one spoken of as "une petite non baptisée." This little girl, the youngest of the Béjard family, is the Armande whom Molière married. In the absence of her baptismal certificate, evidence can scarcely be more clear. In 1643, Marie Hervé names her other children, and adds that she has an infant unbaptized daughter. In 1662 she gives a daughter—not one of the children alluded to by name in 1643—to Molière.

How then did a mystery, and a scandalous one, gather about the birth of Armande? It happened thus:—in 1663, Molière was at foud with the actors of the Hôtel de Bourgogne. One of them, Montfleury, as we learn from a letter of Racine's (4th November, 1663), accused Molière to the King of having married his own daughter. "Montfleury is not listened to at the Court," adds Racine, and Louis XIV. showed what he thought of the miserable charge by becoming godfather to Molière's child. The scandal seems to have arisen in this way:—Molière since 1643 had belonged to the same theatrical company as Madeleine, Geneviève, Louis, and Joseph Béjard. Slander called him the lover of Madeleine, who, in 1638, had borne a daughter to Esprit Raymond, Comte de Modène. Some confusion about this child, such as certainly existed in the mind of Grimarest, or a theory that Marie Hervé was too aged to have been the mother of Armande, must have prompted Montfleury to bring his abominable charge. What is M. Housseye's view? He says that Geneviève, not Madeleine Béjard, was the mistress of Molière, and that Armande was the daughter of Madeleine by the Comte de Modène. Sometimes he inclines to think that Molière was the lover of all three Béjards; but, on the whole, his opinion is that we have stated. How does he prove his point? Geneviève was not present at Molière's marriage; therefore she was jealous, therefore he had been her lover. His evidence is given on p. 46. "Molière was too much the friend of M. de Modène to betray him, therefore I believe that" he fell in love with Geneviève. This is odd logic; Molière would not have loved one sister, therefore he must have given his heart to the other! Now let it be remarked that, in 1642 Modène was not in Paris, or near Madeleine, who four years earlier had been his mistress. He was in exile, and M. Housseye must show how he knows that he was the friend of Molière. M. Loiseleur's theory is that Madeleine was the mother of Armande, and that Marie Hervé acknowledged the child to deceive Modène, who might, in 1643, have been expected to return to Paris. Enough has, perhaps, been said to show how absolutely baseless is M. Housseye's theory, first, that Molière must have loved Geneviève, because to have loved Madeleine would have been to deceive Modène; second, that Modène, who left Paris to follow the Duc de Guise in 1640, and had not returned in 1643, was the father of a child supposed to have been born to Madeleine early in that year. As to this latter point, dates are absolutely conclusive evidence. Having shown that M. Housseye's hypotheses of Armande's birth and of Molière's love for Geneviève are contradicted by facts or founded on mere assumption, let us examine some minor points. He begins by repeating the old story of Molière's Scotch descent, a story utterly refuted by documents discovered by M. le Baron de Trousseau (in M. du Mesnil's *Les aïeux de Molière*, Paris, 1879). M. Housseye says Molière was sent to school in consequence of the entreaties of his mother. Now his mother died four years before the boy went to the Collège de Clermont. Even M. Taschereau, who had not all our documents before him, remarks that Molière had not his mother to back his petition for schooling. On the same page M. Housseye repeats the absurd myth that Molière's father was already incapacitated by infirmities in 1639. Old Poquelin was then forty, and carried on his business for thirty years, dying in 1669. M. Housseye has copied and publishes a picture of an unclothed woman standing in a shell. This he calls a portrait of Armande Béjard as she appeared when speaking the prologue of *Les fâcheux*, in August 1661. He is rather shocked by Molière's exhibiting a very young girl, his own future wife, in the costume of Nana. But Armande Béjard did not speak the prologue of *Les fâcheux*. Madeleine Béjard was the Naiad of *Les fâcheux*. If there were no other evidence, this would be proved by a passage in *La vengeance des marquis*, a piece written to ridicule Molière. "I remember your nymph," says Ariste, one of the characters; "they tried to deceive us, and pass off an *vieux poisson* for a young beauty." Madeleine was thirty-three when she played the part of Naiad, and the most spiteful enemy could not have called Armande, then eighteen, an *vieux poisson*. There is no evidence but an anonymous undated in-

* *Molière, sa femme et sa fille*. Par Arsène Housseye. Paris: Dentu. 1880.

scription to show that the woman etched by M. Houssaye was meant even for Madeleine Béjard. When M. Houssaye comes to discuss Armande's conduct as a wife, he makes a blunder of a sort which proves his incapacity for careful work. The spiteful anonymous libel, *La fameuse comédienne*, says that Armande fell in love with De Guiche, and Lauzun with Armande, when the *Princesse d'Élide* was played at Chambord. The *Princesse d'Élide* was played, not at Chambord, but at Versailles, May 1664. M. Livet says that De Guiche was not at Versailles at all, but in Poland from January 1664 to the end of 1665. M. Livet proves his point by a letter of De Guiche's (*La fameuse comédienne*, Paris, 1877, p. 155). Now M. Houssaye has looked into M. Loiseleur's book, *Les points obscurs dans la vie de Molière* (Paris, 1876). M. Loiseleur, unacquainted with M. Livet's evidence, says that De Guiche accompanied the King to the siege of Marsal, in Lorraine, in September 1663. He was present at Marsal, but, in January 1664, he was writing to Seguior about his perils in the Baltic. M. Loiseleur, unaware of this, says that, if De Guiche was not at Versailles on May 12, 1664, he may have been at Fontainebleau on July 30, when *La princesse d'Élide* was played once more. This is impossible on M. Livet's showing. But M. Houssaye has somehow taken it into his head that the *Princesse d'Élide* was played at Versailles on May 12, and at Fontainebleau on May 16, when Armande fell from virtue. "Quatre jours de plus de sagesse, il n'y a pas de quoi prendre les armes." Now *La Grange's Registre* for April 29, 1664, says the company went to Versailles at the end of April, and remained there till May 22. How, then, could they have played at Fontainebleau on May 16, as M. Houssaye absurdly says? The performance of which he is thinking was given at Fontainebleau between July 21 and August 13. We have little doubt that Armande Molière was a false wife; but M. Houssaye's blunders would almost make a jury absolve the person whom he prosecutes. For example, he says, with truth, that the adventure of the President Lesrot, who was deluded by La Thourelle into thinking himself the lover of Mlle. Molière, is a proof before letters of the adventure of the Diamond Necklace. That adventure was no argument against the reputation of Marie Antoinette; but M. Houssaye maintains that the earlier affair does show that Mlle. Molière was "not inaccessible." The truth is that neither event offers any evidence as to the character of the actress or of the Queen. The Cardinal Rohan and the President Lesrot were induced to believe that they had had interviews with Marie Antoinette and with Armande Molière, when, in fact, they had only seen Mme. Lamotte and a woman named La Thourelle. The facts go no further than to prove that the Cardinal and the President entertained a bad, but erroneous, opinion of the Queen and the actress.

We must now give a final example of M. Houssaye's carelessness and unfitness to deal with evidence. According to Grimarest, who published a Life of Molière in 1705, a great crowd collected round the door on the evening of the comedian's funeral. Mlle. Molière, "not being able to give what the people wanted, was advised to throw a hundred pistoles out of the windows." M. Houssaye, quoting we know not what authority, says that it was Baron, the actor, who threw the money (p. 119). Now it happens that, more than twenty years ago, M. Fillon discovered and published a contemporary letter, in which the writer described the funeral of Molière. From this letter it is plain that money was not tossed to a crowd out of the window, but distributed at the grave-side in an orderly manner, "Aux pauvres qui s'y sont trouvés, à chacun 5 sols." It seems scarcely possible that M. Houssaye should give the apocryphal story in his text and the true account in a note. Even in that note, which stultifies another part of the version in the text, he attributes, not to M. Fillon, but to M. Fournier, the discovery of the letter which describes the funeral.

It is not amusing work following M. Houssaye through his errors and inadvertences. Sometimes it seems as if corrections had been suggested, which he has placed in his notes, or in later parts of his work, while he leaves the original blunder in the text. His volume is a very magnificent "table-book," but we have noticed in it only two remarks worth quoting for their merit. In one M. Houssaye suggests that the *caractères* of a comedy of Molière would make a good subject for a play. In another place he says of Molière's death, "C'était le premier grand deuil du siècle de Louis XIV." M. Houssaye constantly professes the utmost respect for the memory of the great poet. He should have given proofs of this respect by writing more carefully about the life and experience of his hero. M. Houssaye writes much better, though, as usual, with tawdry attempts at epigram, when he is concerned with Molière's daughter than when he is busy with Molière.

FYFFE'S MODERN EUROPE.

THIS is the first instalment of a history of Europe from the time of the French Revolution, which, according to the prospectus of the publishers, is to "be written in a popular and

* *A History of Modern Europe*. By C. A. Fyffe, M.A., Barrister-at-Law, Fellow of University College, Oxford. Vol. I. From the Outbreak of the Revolutionary War in 1792 to the Accession of Louis XVIII. in 1824. With a Map. London, Paris, and New York: Cassell, Petter, Galpin, & Co. 1880.

attractive style." Those who, with this announcement in their minds, take up Mr. Fyffe's work will, we suspect, be disappointed, agreeably or otherwise, according to their individual tastes. "A popular and attractive style" is to some a doubtful recommendation. Although Macaulay—if Professor Seeley and Mr. Frodoric Harrison will allow us to say so—and, more recently, Mr. Green, have shown that to be popular and attractive in style is compatible with the possession of true historical insight and genius, still it is to be feared that "popular and attractive" in an advertisement will to many suggest those intolerable beings, the comic, the gushing, or the sensational historian. Now Mr. Fyffe certainly comes under none of these heads. His danger is rather that the ordinary reader of the circulating libraries may, at the first glance, fling aside the volume as over stiff reading. But those who once begin upon it will find a charm in the quiet, clear, and sober style which never descends to artifices or tricks of language. The author has succeeded well in the difficult task of bringing a vast subject within comparatively narrow limits. He has wisely forborne to load his narrative with details; but has, to use his own words,

endeavoured to tell a simple story, believing that a narrative in which facts are chosen for their significance, and exhibited in their real connexion, may be made to convey as true an impression as a fuller history in which the writer is not forced by the necessity of concentration to exercise the same rigour towards himself and his materials.

The object Mr. Fyffe has set before himself is to show how the States of Europe took their present form and character; and this leading idea gives a unity and coherence which constitute the great merit of his work. Napoleon, who

cast the kingdoms old
Into another mould,

of course forms the central figure on the canvas, and Stalin may perhaps be considered as holding the second place. England, not being recast by Napoleon, does not occupy much space in this volume, which is in truth a history of Continental Europe only. The starting-point of the narrative is somewhat arbitrarily taken "on the morning of the 19th of April, 1792," when it became known that Louis XVI. had resigned himself to the necessity of declaring war against Austria. With all respect for Mr. Fyffe's opinion that this "forms the natural starting-point of a history of the present century," the opening of the narrative seems to us too abrupt, and the retrospective sketch of the Revolution somewhat inadequate. The general justice of the censure passed on the emigrant nobles we do not dispute, but its form may perhaps provoke a smile. When men whose houses had been fired over their heads—unpleasant incidents of which no hint is here given—are reproached with being "too impatient to pursue a course of steady political opposition at home," one is reminded of that naïf chronicler who tells how Bernard, the nephew of Louis the Pious, died of having his eyes put out, *quod impatiens tulit*. Or perhaps, to students of more recent history, the phrase will rather recall the tone of a Liberal Minister chiding a perjured Irish landowner. However, in Mr. Fyffe's subsequent narrative he does not attempt to "cut minute" the crimes of the Revolution, but speaks with righteous wrath of Danton and the September massacres. He is stern, too, towards the Republican legends of *la guillotine d'angoisse* and the hostile

bonnets of bay,
De traitres, de lâches, de quakers.

It is true that he who wrote, and they who sang, the burning words of the *Marseillaise* believed devoutly in the reality of the danger; but the politicians who directed and influenced them knew better. The *ros confuses* did, indeed, hate the Revolution, and they made no secret of their hatred:—

But the statesmen of the French Assembly well understood the interval that separates hostile feeling from actual attack; and the unsubstantial nature of the danger to France, whether from the north or the south in 1792, was proved by the very fact that Austria was treated as the main enemy.

Condemnation, however, of the statesmen who plunged the nation into war should blind no one to the real nobility of the uprising of Revolutionary France. The insane manifesto of the Duke of Brunswick—connected, as we now know, between Marie Antoinette and Count Fersen—and the unpatriotic and unstatesmanlike policy of the *émigrés*, made the war a just one on the part of France. In speaking of 1792 Mr. Fyffe rises into eloquence:—

No conscription dragged the peasant to the frontier. Men left their homes in order that the fruit of the poor man's labour should be his own, in order that the children of France should inherit some better birthright than exaction and want, in order that the life-won sense of human rights should not be swept from the earth by the truis of privilege and caste. It was a time of high-wrought hope, of generous and pathetic self-sacrifice; a time that left a deep and indelible impression upon those who judged it as eye-witnesses. Years afterwards the poet Wordsworth, then alienated from France and cold in the cause of liberty, could not recall without tears the memories of 1792.

At the same time Mr. Fyffe, with all his appreciation of the revolutionary enthusiasm, both does justice to Pitt's desire to maintain peace and comprehends, without altogether defending, the motives which prompted England to war. We are glad to see that he distinctly tells his readers that the actual declaration of war proceeded from the Convention—a fact which is often overlooked by those who condemn England for entering upon the struggle. Mr. Fyffe sets forth well and clearly the real cause of strife underlying the "points of technical right" which "figured, as usual, in the complaints of both sides":—

France considered itself entitled to advance the Revolution and the Rights of Man wherever its own arms or popular insurrection gave it the

command. England denied the right of any Power to annul the political system of Europe at its pleasure. No more serious, no more sufficient, ground of war ever existed between two nations; yet the event proved that, with the highest justification for war, the highest wisdom would yet have chosen peace.

Further on, it may be thought that Mr. Fyffe's treatment of his own country errs on the side of bareness and dryness. Thus he gives no hint of the stir and spirit with which England in 1803 prepared to repel the threatened invasion. For that sort of thing his readers must go to Mr. Hardy's *Trumpet-Major*. Mr. Fyffe is here as dry and passionless as a professed military historian. Though he observes that the army at Boulogne was "sufficient to overwhelm the military forces of England," he says not a word of the Volunteers. Yet surely the raising of a volunteer force to resist invasion is a fact of some importance from a political and social point of view. So the joy and eager hopes with which the cause of the Spanish insurgents was taken up pass unnoticed. A few words from some contemporary speaker or writer might easily have been found to give a notion of the feeling of the time when, as Lady Crewe exhaustively put it, "all the Whigs, as well as Tories, down to Democrats and Methodists," were at one in their zeal to help Spain. Altogether Mr. Fyffe has rather neglected to bring out in his picture the figure of Great Britain standing up single-handed against well-nigh the whole Continent. On the other hand, he has been especially successful in putting in a clear light the part played by Napoleon. His treatment may perhaps be thought rather too favourable; but it shows a side of the conqueror's career which is almost in danger of being forgotten. In the case of Napoleon, Liberalism may be said to have now burned what it once adored. The days are past when to admire Napoleon was the mark of zeal for liberty and of superiority to vulgar prejudice, when Becky Sharp felt that she could not better proclaim her emancipation from Miss Pinkerton than by crying "Vive l'Empereur!" It seems strange to think that there ever were days when an ardent Radical could allude to the earlier campaigns of Napoleon as the time "when for once arms were pious, and invasion virtue," "the sunny spot in the annals of the destroying art." Since then M. Launfrey has laid bare the meaner side of Napoleon's political and military character; Mme. de Rémusat has torn the last shred of covering off his private life; and the resuscitation of nationality in Germany and Italy has led us to look upon Napoleon's early aggressions with an indignation which the elder school of Radicals would have found it hard to understand. In fact, the modern view of Napoleon approximates to that held by Sir Archibald Alison, the typical Tory; and the very terms in which Mr. Freeman, speaking out of the purest spirit of Liberalism, denounces "the Corsican usurper, would formerly have been thought redolent of Toryism. Now Mr. Fyffe, without worshipping Napoleon, well understands how he appeared in the eyes of the men of 1799.

Almost everything that now darkens the early fame of Bonaparte was then unknown. His falsities, his cold, un pitying heart were familiar only to accomplices and distant sufferers; even his most flagrant wrongs, such as the destruction of Venice, were excused by a political necessity, or disguised as acts of righteous chastisement. The hopes, the imagination of France saw in Bonaparte the young, unsullied, irresistible hero of the Republic.

Neither does our present author share in Mr. Freeman's wrath at the overthrow of venerable Empires and ancient Republics. He observes that even in Freedom's chosen seat on the heights of Switzerland, "a sufficiently large class was excluded from political rights to give scope to an agitation which received its impulse from Paris." He says boldly that at the beginning of the century "the peoples of Germany cared as little about a Fatherland as their kings," and that though in the Rhenish provinces there had been murmurs at the extortionate rule of the Directory, yet "after the establishment of a better order of things under the Consulate, the annexation to France appears to have become highly popular." In Italy, "the more enterprising minds . . . found that the Napoleonic rule, with all its faults, was superior to anything that Italy had known in recent times." His own opinion is that the Empire of 1806 might have been permanent had Napoleon abstained from further aggression; and he can even see a good side to the annexation of Hamburg and the North-German coast:—

Had the history of this annexation been written by men of the peasant-class, it would probably have been described in terms of unmixed thankfulness and praise. In the Decree introducing the French principle of the free tenure of land, thirty-six distinct forms of feudal service are enumerated, as abolished without compensation.

He admits frankly that the price which was paid for the benefits of Napoleon's supremacy was "the suppression of every vestige of liberty, the conscription, and the Continental blockade," which last was the straw that broke the camel's back:—

Even in such torpid communities as Saxony, political discontent was at length engendered by bodily discomfort. Men who were proof against all the patriotic exultation [exaltation?] of Stein and Fichte felt that there must be something wrong in a system which sent up the price of coffee to five shillings a pound, and reduced the tobaccoist to exclusive dependence upon the market-gardener.

We might easily multiply extracts, for the pages abound in terse and thoughtful remarks which lend themselves well to quotation; and we might pick out many passages which invite comment; but our limits oblige us to confine ourselves to the mention of a few points only. Correction is needed at p. 518, where Caulaincourt thrice appears as Coulaincourt. In his note at p. 252 Mr. Fyffe is too plainly anxious to make out that the Convention, if not exactly a nursing-

mother to Christianity, took no part against it. He shows, indeed, that the ordinary notion that the Convention "abolished Christianity" is an error, or, as he prefers to say, "a fiction." But when he adds that "where churches were shut up or profaned . . . it was the work of local bodies, or of individual Conventionalists on mission," one cannot but ask whether M. Thiers and Mr. Carlyle are in error in representing that the Convention gave its sanction to one notorious profanation by accompanying in a body the Goddess of Reason to Notre Dame? And, even by Mr. Fyffe's own admission, the Convention at one time forbade the exercise of Christian worship "in a distinctive building (i.e. church)," which is surely equivalent to shutting up the churches. In the contrast which, at p. 35, he draws between the French peasant, even before the Revolution, and the far more completely enslaved Prussian serf, he observes:—

It is significant of the difference in self-respect existing in the peasantry of the two countries, that the custom of striking the common soldier, universal in Germany, was repugnant to the whole spirit of French military service. A blow given to the poorest French soldier was a wrong that excited the bitterest resentment.

If this is descriptive of the state of feeling immediately before the Revolution, the author may be right; but half a century earlier we have the evidence of Marshal Saxe that in his day the officers at least thought it not repugnant to the spirit of the service to box their men's ears:—"En France on ne fait pas de difficulté de souffleter les Soldats." We do not lay so much stress on the testimony of Turpin de Crissé, writing in 1769, because he intimates that it was the admirers of the German military system who were the worst offenders; but still his words are decisive as to the fact that blows were not infrequently given. "Pourquoi, lorsque le soldat manque à ses devoirs, se servir de ces termes injurieux, qui ne sont que trop communs? Pourquoi accompagner-t-on souvent ces injures de coups de bâton?" What French officers really stuck at, according to Saxe, was any formal and legalized infliction of corporal punishment; and it was the attempt to introduce this, in the shape of *coups de plat de sabre*, which caused such an outcry against the innovations of Turgot and St. Germain in 1776. But it may be added that a recent historian of Turgot's administration, M. Jobez, has more than hinted his opinion that on the part of the *gentilshommes* the outcry was got up to mask their opposition to the more beneficial of St. Germain's reforms, and that in their own practice they were not always so scrupulous about the dignity of humanity in the person of the common soldier. Lastly, we will call attention to the striking passage in which Mr. Fyffe delivers his soul on the English land-question:—

It would perhaps have been better for the English labouring classes to remain bound by a semi-servile tie to their land, than to gain a free holding which the law, siding with the landlord, treated as terminable at the expiration of particular lives, and which the increasing capital of the rich made its favourite prey. It is little profit to the landless, resourceless, English labourer to know that his ancestor was a yeoman when the Prussian was a serf. Long as the bondage of the peasant on the mainland endured, prosperity came at last. The conditions which once distinguished agricultural England from the Continent are now reversed. Nowhere on the Continent is there a labouring class so stripped and despoiled of all interest in the soil, so sedulously excluded from all possibilities of proprietorship, as in England. In England alone the absence of internal revolution and foreign pressure has preserved a class whom a life spent in toil leaves as bare and dependent as when it began, and to whom the only boon which their country can offer is the education which may lead them to quit it.

Now, forcible and true as much of this is, it overlooks the fact that the descendants of the English yeoman have risen as well as fallen. If the vanity of genteel families would permit them to avow the *status* of their ancestors, it would in a large number of cases appear that their founder was some clever yeoman or "statesman's" son, who took to trade or to a profession as being more profitable than sticking to the land. The "resourceless" labourer is probably the descendant of the unenergetic or unsuccessful members of his class. Owing, in short, to the many openings in English life, the land has never absorbed the best talents and energy of the population. It may be a pity that this should have been so, but the whole blame, if blame there be, does not rest with the law. It is not the law, but the operation of natural causes, that has swept away the Cumbrian "statesmen." As for being "sedulously excluded," we should be glad to know what law excludes any man from the possibilities of proprietorship. Without discussing the matter further, we may suggest a doubt whether the narrow space of a single paragraph in a popular history is the fittest place for setting forth views on so difficult, so complicated, and so "burning" a question as that of the land. But, whether we agree or disagree with Mr. Fyffe, we must praise his book as a vigorous, thoughtful, and well-written piece of work.

SUNLIGHT AND SHADOW.*

"I PRETEND to no literary ability," Mr. Gough writes in the opening chapter of this volume, "and am aware that I am more at home on the platform than with the pen." It is a pity when a man knows what his powers are that he is not content with exercising them, but must needs venture upon an untrodden field. Mr. Gough is getting on in years. It is a good while, he tells us, since he was first startled by hearing some one address

* *Sunlight and Shadow*. By John B. Gough. London: Hodder & Stoughton. 1880.

him as "old man." He has been a temperance advocate for thirty-eight years, and he has caught all the tricks of the platform orator. He would have done well had he stuck to public speaking, as long as he has anything that he wishes to say; and when at length he was tired of what his countrymen call "orating," had then contentedly let the world forget him. We have no doubt that, in spite of many extravagances, he has done a great deal of good. Even those much-abused men, the moderate drinkers, are well aware of the vast amount of misery caused by drunkenness, and are grateful to all who lessen it. Happily we need not be teetotallers to know that excess in drink, as indeed in all other things, is bad. We are willing to admit that, for a man who has once given way to intemperance, the only chance of hope lies in total abstinence. We can readily believe that such men will be more easily moved by a reformed drunkard, like Mr. Gough, who knows how hard the struggle is through which they have to go, than by those who have never felt the real strength of the temptation. In listening to the speakers at a temperance festival a good deal of amusement can, no doubt, often be had; but at the same time there is found an interesting opportunity of studying character. We remember once hearing a smug-faced minister, in gentle tones, assure his beloved brethren that the beautiful moon did not shine on ugly beer and porter, but on pure lovely water, and that, therefore, it was water, and water alone, that they ought to drink. No one was moved. He went on to say that he knew a mother of ten lovely children and one idiot. The idiot was the eldest, and was born before she had signed the pledge. Still the people were scarcely stirred. But he was followed by a decent-looking workman in good Sunday clothes. He described how a few years before he had been in rags. He then pointed to the dress he was wearing, turned himself round, and said, "Is this a good coat? Is this a good pair of trousers? Why is this, why? Cos I ain't got no drink in my eye." He next pointed to a decent comfortable-looking woman who was, he said, his wife. He drew the attention of his hearers to the excellence of her gown, and told how ragged she, too, had once been. He again triumphantly asked, "Why is this, why?" and as triumphantly answered, "Cos I ain't got no drink in my eye." In like manner he described the various advantages of his reformed life, and gave the same poetical explanation of the origin of each. He carried his listeners away with him, and was rewarded with shouts of applause. Now, such a position as this Mr. Gough can always take. For seven years he was a drunkard. In the book before us he describes the miserable garret in which he was lying when he fought the battle with himself and won self-mastery. No doubt, as he has again and again told his story, he has touched men whom no one could have touched but those who knew to the full both the strength of their temptations and the bitterness of their sufferings. But such an experience as this, even though it be added to a considerable power of public speaking, goes a very little way towards fitting a man for authorship. Indeed, we scarcely know of a worse apprenticeship that a writer could serve than seven years of hard drinking, followed by thirty-eight years of platform oratory. It may be the case that Mr. Gough's book will be enjoyed by those who usually flock to hear him. The Exeter Hall standard of taste is, we know, not very high. Buffoonery there is often mistaken for wit, and clap-trap for argument. But, however popular *Sunlight and Shadow* may become with the followers of Sir Wilfrid Lawson, yet it is not a work that can be read with satisfaction by those who have any real respect for literature.

Mr. Gough is certainly right when he says, in the first chapter, "My book will be somewhat desultory, one thing leading on to another." No more desultory work have we ever read. He skips about from subject to subject, and from story to story, in a most tiresome manner. We could almost believe that he had emptied out on a table a whole bagful of the anecdotes with which he enlivens his audience, and had then set himself to piece them together in the order in which they lay. To the English reader—and perhaps to the American, though for a different reason—the most amusing part will be found in the description that Mr. Gough gives of his last visit to England. We can allow, and more than allow, for his pride in the welcome that he received. When a Lord Chancellor, a man, to use his own words, at "the very topmost pinnacle of the London world," presided at one of his lectures, we can feel with him when he says, "What a personal triumph to be thus honoured for my work's sake in the land where I was born to so low a lot!" His father had been a private in Sir John Moore's army, and in the retreat to Corunna had known what hunger meant, for, as he told his son, he had felt the two sides of his stomach grinding together. But, while we willingly admit of Mr. Gough's exultation, yet we could have wished that he had set some limits to it. We got a little weary of his great friends and of the descriptions of their merits. We should like to have temperance in all things, and when it comes to puffing we will gladly allow of even total abstinence.

Mr. Gough's opening day was in the "College Gardens of Westminster Abbey," where he was welcomed by the Dean. There "tea and coffee were served in a marquee." There could be seen "the gray towers of the venerable Abbey, and the clock-tower and Victoria Tower of the Parliament Houses," and at the same time many eminent teetotallers. "Royalty," Mr. Gough tells us, "resides in close proximity; and in ermine gown, and solemn wig, and official pomp, the proud peers of Britain assemble to legislate, not a stone's throw from this sacred shrine." It is clear that he

has carefully studied West's picture of the death of Chatham. From Dean Stanley we pass on to Sir Charles Reed, the brother-in-law of "Hon. Edward Baines." It is surprising, by the way, how liberal Mr. Gough is in distributing his titles. He might be a Prime Minister on the eve of resignation. We are not only told all that Sir Charles has done—and that he has done a good deal we willingly allow—but we learn moreover what he might have done. "I believe," says our author, "he might have been Lord Mayor had his ambition led him in that direction; but, as he refrained from coming forward as an alderman, of course he cannot rise to that dignity." Is Mr. Gough really simple enough to believe that a teetotaller could become Lord Mayor? When he came to stand his election, unless he took a pledge to break through his pledge, who can doubt that he would be scornfully rejected by the Livery? But doubtless at such a time his brother abstainers would show him indulgence, and would wink at his frailties as he welcomed his guests in the loving-cup. We remember a small tradesman in a country village who was a great supporter of the temperance cause. When, as regularly happened as Christmas came round, his brother got drunk, he was not scandalized. He used to say, "My brother, sir, is the head of the parish, and, as a pillar of the Church, is bound to drink at this season." But to return to Mr. Gough and his friends. From Sir Charles Reed we pass on to Mr. Samuel Morley. This great abstainer's income is set down at 70,000*l.* a year; and half of it is said to be spent in charity. "He is a Dissenter and a Congregationalist. As a man of business he has few equals. His factory is at Nottingham; his warehouse in Wood Street, Cheapside, and he has a superb residence some way from town." Nor is this all. "In spite of his great wealth, he always dines in the middle of the day," and "one sees him driving about in a fine mail phaeton, as if he were some thirty or forty years younger than he really is." He has to pay the penalty of all these high qualities. He desires "to take things a little easier, but it seems that people will not let him; for instance, he wishes to retire from Parliament, but the Bristol people insist on retaining him as their M.P." We presently come to Canon Farrar, who looks, we learn, every inch a gentleman, and who was formerly, if we are to believe Mr. Gough, Head-master of Harrow School. He has a magnetism about him that, when he speaks briefly, makes you long to hear more, and he can boast that all his children have signed the total abstinence pledge. We then come to the "Lord Bishop of Exeter," who is, we read, the successor of Dr. Arnold at Rugby. Mr. Gough is certainly very often unfortunate in his facts. "The Bishop is dark in complexion and hair; he has an ecclesiastic, scholastic, and high-bred appearance." The "Lord Bishop of Rochester," to whom we are next introduced, "is small in person, but great in effort, . . . and the perfect gentleman." Passing by two other bishops, we arrive at "Hon. Mr. Talbot," who is very oddly described as "the Lord Lieutenant and father of the House of Commons." From him we pass through Mr. Whitworth, who is "thoroughly the gentleman without any superciliousness," to that glory of teetotallers, Sir Wilfrid Lawson. "I am told," says Mr. Gough, "that his income from land alone is 100,000*l.* per annum." And yet with all that vast fortune he is so condescending that he takes the trouble—and a good deal of trouble too—to be witty. From Sir Wilfrid we reach that great medical total abstainer, Sir Henry Thompson. He, we learn, was so fortunate as to perform a successful operation on the late King of the Belgians. "The King gave him, so I have heard, 3,000*l.* The Queen of England made him a knight, and nobles and great men consulted him; and it is said that his practice is worth 20,000*l.* per year." Descending a few steps lower in the social scale we arrive at the Mayors of Rochdale, Bury, and Oldham, who at one of Mr. Gough's lectures "gave their countenance, in their official capacity (for they wore the massive gold chains and insignia of office), to the temperance cause." The Mayor of Wigan, we notice, was conspicuous by his absence. Yet it was hardly to be expected that he should attend, for, according to an old Lancashire tradition, he enjoys a great privilege. Should he see three pigs lying anywhere together along the Queen's highway, he has the right of making the middle one get up and of lying down in its place. This is a clear sign of the jovial and unabstaining character of the Corporation of that ancient town. Rising very rapidly, we come to the Duke of Westminster, who is "a personal abstainer." Why personal? we find ourselves asking. Can it be the case that some great men abstain by deputy? Space prevents us from noticing the rest of Mr. Gough's long row of great men, but yet we cannot pass over a pleasing anecdote about Dr. Parker of the City Temple. "I remarked to him," writes our author, "'You exhibit many striking peculiarities in your pulpit delivery.' He said, 'I should not be Joseph Parker if I did not; but' (laying his hand on my shoulder) 'come here, my dear fellow, and tell me of my peculiarities.'" And yet, says Mr. Gough, "no one who has seen Dr. Parker in his home would judge him to be an egotist."

We have no time to dwell on the absurd blunders into which Mr. Gough too often falls; yet one is so gross that we ought not to pass it over in silence. In writing about our Post Office he says, "The old stamps are pasted together and in some of the obscure parts of the town are offered you at a reduced price. The Post-Office authorities have issued a new pattern of stamp, because nearly one-third received had been cancelled and renewed." The lies told to foreigners are, indeed, like those told by Falstaff, "gross as a mountain, open, palpable." Let Mr. Gough stick to drink. When he tells us that by daytime he has walked in the brilliant metropolis, and that the ker-

note in every street was drink, we scarcely heed the exaggeration. It is, we know, the ordinary intemperance of the temperance advocate. But when he makes this ridiculous statement about the postage-stamps we are shocked at his ignorance, his credulity, and his rashness. He will doubtless learn that his whole statement from beginning to end is utterly untrue. Then, we trust, he will take a solemn pledge that henceforth he will only write about what he really understands. If he does this, his next book will be of much more moderate compass than his *Sunlight and Shadow*. We must not, however, take our leave of the old veteran without some word of praise. We therefore gladly own that, mixed with a great deal of poor stuff, are to be found some very amusing stories of the strange characters whom Mr. Gough has come across in his long and varied life.

PREHISTORIC PERU.*

IT is high time that some attempt should be made to investigate and record the ethnographical antiquities of Peru before they are either destroyed by the ignorant greed of treasure-hunters or dispersed by the misdirected zeal of individual collectors, who value the objects they obtain for their beauty or their rarity, without noting the locality where they have been found. It is a fascinating, and almost an untrodden, field of research. The hideous story of the conquest was told by several contemporary chroniclers, out of whose records Prescott compiled his brilliant and picturesque narrative. We know probably all that we need care to know about the mere facts of that very discreditable passage in the annals of Spain. Again, the leading characteristics of Peruvian architecture have been set forth in more than one illustrated work, and those who care to investigate such matters can make themselves familiar with the temples of Cuzco and the palaces of the Inca on the islands in Lake Titicaca. But, up to the present time, we have been completely in the dark about the social history of the people whom the Spaniards extirpated. The overthrow of the Peruvian monarchy and nation was so sudden and so complete that the historians who recounted it had not time for more than a narrative, more or less circumstantial, of the various phases of the conflict. They had neither time nor inclination to investigate the civilization of the conquered race. Pizarro and his followers, as is well known, regarded Peru as a gold-mine, from which so many millions of ducats might be extracted; but they were too greedy of immediate gain to remember that in many cases the artistic value of the objects surrendered far exceeded that of their actual weight. When the ransom of the Inca came to be appraised, the value of it by weight was found to amount to a sum that has been estimated at three and a half millions of our currency. It consisted, as Prescott tells us, not of coined money, but of "goblets, ewers, salvers, vases of every shape and size, ornaments and utensils for the temples and royal palaces, tiles and plates for the decoration of the public edifices, curious imitations of different plants and animals." How instructive would even a few of these pieces have been! The enumeration reads like a page out of the tale of "Aladdin" or the "Memoirs of Monte Cristo"; but there seems to be no reason for doubting its authenticity. Gold and silver vessels are still occasionally found in Peruvian tombs; and the beauty of some of these very objects was so great that Pizarro himself was struck by it. He decided to set apart certain pieces when the bulk of the booty was melted down into ingots, and send them straight home to Spain as a present to Charles V. Among them were some vases of the purest gold, richly ornamented, measuring twelve inches in height by thirty inches in circumference. It would be an interesting task to try to trace the fate of these precious specimens of barbaric art. It is just possible that one or two may have survived the changes and chances of Spanish politics, and still exist in some forgotten corner of the royal palaces; just as fragments of the golden plates that once encrusted the walls of the Temple of the Sun at Cuzco are still to be seen there in private collections. The religion, again, of the Peruvians, and all that concerned it, was a special object of hatred to the conquerors. Temple after temple was invaded, the emblems of the sun-god were destroyed, and the sacred vessels and ornaments were consigned to the melting-pot. As for the creed or the observances, what son of the true Church could be expected to trouble himself with such inventions of the Evil One?

The Peruvians themselves had no written language, and their historical traditions, transmitted orally, were confined to the most privileged classes. "Science," said one of the Incas, "was not intended for the people, but for those of generous blood. Persons of low degree are only puffed up by it, and rendered vain and arrogant." They had not even a rude picture-writing like that employed by the Mexicans, but were content to entrust their annals to the safe keeping of the mysterious *quipus*. This was a cord of threads of different colours twisted tightly together, from which a number of smaller threads were suspended after the manner of a fringe. These smaller threads were tied in knots, which represented numbers; while the colours denoted objects, or abstract ideas. The Spaniards bear testimony to the singular adroitness with which the Peruvians used this cumbrous substitute for an alphabet; but when the key to the system had

been lost—and the secret was known only to the "wise men"—who was to read the record? A sketch of the government and social life of the ancient race was, indeed, drawn up, not more than thirty or forty years after the conquest, by Garcilasso de la Vega, himself of Peruvian descent; but he wrote in Spain, at a distance from the sources of information that were in existence then, so that his work, valuable as it is, is full of inaccuracies. Moreover, it was avowedly an apology for his people, and on that account, if on no other, must be read with caution. The authorities, therefore, on which history is usually based do not exist in the case of Peru. Fortunately, however, the ruins of public buildings of all kinds are abundant, and sufficiently well preserved to repay attentive study; while the number and extent of the cemeteries that still exist all over the country, notwithstanding three centuries of treasure-seeking, attest the vastness of the ancient population.

One of these, situated near Ancon, now an insignificant watering-place on the Pacific coast north of Lima, has been lately explored by Messrs. Reiss and Stübel, the first part of whose sumptuous work has just appeared. There are no ruins at Ancon, and the very existence of the graves was unsuspected until the beginning of the railway between Lima and Chancay. The place, however, must have been an important one in former days from the size of the cemetery, the area of which, surrounded by a wall, occupies at least a square mile. The authors admit that the discovery of the graves was "the occasion of a barbarous and indiscriminate rifling" of them by a crowd of adventurers, who hurried to the spot in the hope of finding gold; but, nevertheless, they seem to have been successful in their attempts to carry on a systematic investigation of the place. Possibly their rivals were soon wearied of digging in a hard deposit of stratified sand and gravel, once, it would seem, the bed of an estuary, which yielded no objects more precious than earthenware vessels and rude articles of domestic use. At any rate, our explorers were able to accumulate a large collection, of which they speak as follows in their preface:—

For these results we are indebted to the custom prevalent among the Peruvians, as among other ancient peoples, of depositing with the dead the objects of daily use, as well as the garments and ornaments worn by them in life. In this way arms and decorations, tools, pottery of the most varied forms and sizes, toys and articles of the toilet, nay, even provisions and domestic animals, have been handed down to posterity. It should be added that at Ancon a method has been discovered of equipping the dead not hitherto known to have been elsewhere practised in Peru, and owing to which a large number of artistic garments and many-coloured fabrics have been preserved.

The equipments of the dead, the peculiar appearance of the mummies, and the more remarkable specimens of woven materials will form the chief subject of our illustrations.

It cannot be denied that the graves of Ancon must have been those of quite a poor population, that the place itself was of no importance, as appears from the absence of any large ruins, and that there are many other spots which must have played a far more important part in Peruvian history, and which might consequently be considered more suitable for investigations of this sort. But, like the rural town of Pompeii, which has afforded a clearer insight into the home-life of classical antiquity than could have been obtained from places of far more historical importance, the comparatively obscure settlement of Ancon will probably long remain the chief source of information regarding ancient Peruvian culture. Large cities and sites distinguished in the records of the past have been destroyed or ransacked, while the forgotten graveyard of Ancon held out little temptation to the rapacity of treasure-seekers. Owing to this circumstance, combined with the favourable climate and the nature of the soil, the treasures here entrusted to the earth have been remarkably well preserved.

Apart from the intrinsic interest attaching to the objects brought to light at Ancon, the value of a work dealing specially with them must be greatly enhanced when other Peruvian burial-places come to be explored in the same systematic manner. Such researches must ultimately lead to a solution of the important questions touching the common or independent social development of the various peoples subject to the Empire of the Incas, and we shall then be also enabled to form a better idea of the political relations in which the coast tribes stood to the Indians of the Cordilleras.

The work is to consist of about ten parts of the size of the present one. This will give rather more than one hundred plates, which are to be distributed under the following heads:—I. The Necropolis and its Surroundings; II. The Mummies and their Apparel; III. Ornaments of the Graves; IV. Garments; V. Woven Fabrics; VI. Pouches; VII. Head-dresses, Shoes, Articles of Toilet, Domestic Implements; VIII. Tools, Arms; IX. Clay and Wooden Figures; X. Earthen Vessels; XI. Articles illustrative of Anthropology, Zoology, and Botany. The present Part contains a map and ten plates, of which two are devoted to views of Ancon and its neighbourhood, and the general aspect of the graves, while the rest contain very carefully executed figures of the mummies (as we call them, for want of a better name) and the objects found with them. It is rather unfortunate that, for some unexplained reason, the plates do not follow each other in regular sequence. For instance, we have Nos. 1, 2, 6, 13, 15, 16, 36, 48, 86, 90, 94. It is therefore impossible to estimate the results of the exploration of any single grave. On Plates 15 and 16 we have views of two of the mummies, which we presume have been selected as typical specimens. They are large, square masses, strongly resembling a very ill-constructed scarecrow, formed of a coarse cotton sack stuffed with leaves and seaweed, and dressed in parti-coloured cotton garments. Round the lower part of the mummy are a number of cords made of twisted grass, attached to four others, more strong, stout, and long, which were evidently used to lower the body into the grave. The upper part of one of these mummies is fashioned into a rude caricature of a head, with a most curious artificial face, made of clay, into which pieces of a white substance, possibly shell, have

* *The Necropolis of Ancon in Peru: a Series of Illustrations of the Civilization and Industry of the Empire of the Incas. Being the Results of Excavations made on the spot by W. Reiss and A. Stübel, with the aid of the General Administration of the Royal Museums of Berlin. London: Asher & Co. 1881.*

been inserted, to indicate mouth and eyes. There is a rather elaborate headdress, and long black hair. Within this casing was found the body of an adult, in a squatting posture—the invariable attitude in all Peruvian graves; and on its head was the body of an infant, wrapped in cloths. Detailed drawings of the ceremonies are promised in future plates, which we hope may be accompanied by better letterpress than the few meagre and unsatisfactory lines, evidently translated from the German by an unskilful hand, which profess to describe these very remarkable relics. On Plates 36 and 48 we have representations of woollen fabrics, executed by a new process, combining photography with chromolithography. Nothing can be better than these plates. The stuff looks real enough to be raised from the paper, and the colours are clear and distinct without being unduly brilliant. We next come to the objects found with the dead, of which “spindles and workbaskets” occupy Plate 86. The baskets, made of grass tastefully plaited in patterns that are still not uncommon, contain all the odds and ends usually accumulated in such receptacles. The authors enumerate “needles and bodkins, balls of thread, tufts of wool or cotton, fragments of bright threads and tissues, small stones and metal wares, bits of stick, shells and grains of maize, neckties, finger-rings, wooden and clay figures, and small dishes of wood or clay.” The spindles are among the most tasteful objects yet found. They are made of hard wood, with whirls of terra-cotta, gaudily painted in a pattern which is usually carried for some distance along the shank of the spindle. Several of these are figured. Plate 90 illustrates some curious clay figures which the authors decide to have been children’s dolls. One of them was strapped to a wooden frame representing a cradle. We hope that as large a number as possible of these articles of domestic use will be figured in subsequent numbers. It is from them that the social life of the Peruvians will be best understood. The whole work promises to be one of the best contributions to the ancient history of the human race that has yet appeared.

DR. WEBB’S FAUST.*

ONE of the first things we learn from Dr. Webb is that the published English translations of *Faust* are reckoned at more than forty. To add to this number is, especially for a man who has other things to do, a grave responsibility. Dr. Webb has done other things with credit; and we cannot say that in our honest opinion he has justified himself in bringing the translations of *Faust* nearer by one to fifty. Not that he fails, in any case, for want of a good theory of translation. He has an excellent one. He rightly makes it a cardinal point to aim at reproducing the form of the original; by which he understands preserving the German metres and rhythm, but with a certain license of replacing double rhymes by single ones, in consideration of the relative poverty of English in this respect, except where the double rhyme is an integral part of a metrical system. Nothing could be more just and judicious; though, on the point of double rhymes, it is fit to be noted that Mr. Swinburne has done much to dispel the common belief of a want of resources in our language. But there are very few, it is true, if there be any, who can shoot with Mr. Swinburne’s bow (we are speaking not of his rank, on the whole, as a poet, for which this is not the occasion, but of his mastery of language and verse). We quite agree, therefore, that a translator from German does better to abandon a certain number of double rhymes than to torment himself in seeking barely possible combinations. But, while we commend Dr. Webb’s intentions, and shall have more to say anon of his introductory helps to the understanding of *Faust*, the main body of his work must needs be judged not by intentions but by performance. And we are unable greatly to commend its performance in the face of what has been done by others. Turning to Bayard Taylor’s version, which marks, as we have said at other times, the highest standard yet reached, we find that Dr. Webb’s not only does not rival it, but does not for general fidelity in letter and spirit come anywhere near it. We do not say that in some particular passages the two may not appear to be on a level. Dr. Webb’s best work is, according to such a roughly estimated balance as we can strike, about equal to Bayard Taylor’s least good; and it may now and then happen (though we have not ourselves observed it) that Bayard Taylor is at his worst when Dr. Webb is at his best. In a really difficult and trying passage like the chorus of spirits beginning

Schwindet, ihr dunkeln
Wölungen droben—

Bayard Taylor’s superiority is almost immeasurable; superiority not only in closer rendering of the German, and tracing the minute anatomy of its structure, but in transferring its harmonies and poetic movement to the sounds and movement of English verse. In translation Dr. Webb is plausible, but not really accurate; in diction and movement he is facile and sometimes brilliant, but seldom really harmonious and poetical. We will take one little phrase by way of illustration. When Wagner knocks at the door of Faust’s study, Faust, who has just been in the presence of the Earth-spirit, exclaims:—

O Tod! Ich kenn’s—das ist mein Famulus—
Es wird mein schönstes Glück zu nichts!
Dass diese Fülle der Gesichte
Der trockne Schleicher stören muss!

* *Faust*. From the German of Goethe. By Thomas E. Webb, LL.D., Q.C., &c. Dublin: Hodges, Figgis, & Co. London: Longmans & Co. 1880.

For which Dr. Webb gives:—

O Death! I know—it is my Famulus!
Mine opportunity hath come to nought!
That the full vision which my spirit sought
Must, by the prowling dunce, be ended thus!

“Prowling dunce” looks at first sight a neat and happy rendering. But a moment’s reflection shows that it will not do. Wagner is a little-minded man, a prig, and a bore; but he is not a dunce by any means. If he were, he would not be in a position to inflict his company on Faust. On the contrary, he is book-learned, industrious, a useful assistant, and (it should seem from his performance in the Second Part) a skilful manipulator. Far truer to words, metre, and meaning is Bayard Taylor, who turns the lines as follows:—

O death!—I know it—’t is my Famulus!
My fairest luck finds no fruition:
In all the fulness of my vision
The soulless sneak disturbs me thus!

Sir Theodore Martin has “soulless driveller,” which, though it does not exactly hit the mark, is better than Dr. Webb’s invention. And if, being satisfied how much Bayard Taylor’s level is above Dr. Webb, we proceed to test the latest comer’s work by the standard of Sir Theodore Martin’s, taken as a good specimen of the second rank of translations, we shall still find that Dr. Webb is not certain of holding his own. By translations of the second rank we mean those which endeavour to keep in the same compass as the original, but are content with a general and more or less loose resemblance to its structure and rhythm. Dr. Webb, as we have said, aims at more, and not unfrequently with relative success. In the soldiers’ chorus in the scene “Vor dem Thor,” he is not more left behind by Bayard Taylor than he outstrips Sir Theodore Martin, who here falls back on mere paraphrase. If his average merit were kept up to this, he might claim a very respectable place, which the reader accustomed to examination-lists might imagine as either towards the end of the first class or at the head of the second. If we may be pardoned a little academic slang, the position would be something like that of the candidate of whom examiners say in consultation, having placed the undoubted first-class men, “Well, shall we give him a first?” Unfortunately Dr. Webb’s average is brought down by some extraordinary lapses into commonplace flatness or extravagant bad taste, such as in a classical translation paper (to continue the simile) would so affect a candidate’s marks for style as to leave him a good deal of leeway to make up. When Faust says to the Earth-spirit:—

Soll ich dir, Flammenbildung, weichen?
Ich bin’s, bin Faust, bin Deinesgleichen!

Dr. Webb makes him say:—

Flamboyant Form!—I dare the sequel!
I’m he—I’m Faust—am none the less thine equal!

Again, “Ye antique fixtures, which I do not want” (for “Du alte Gerathe, das ich nicht gebraucht”) combines baldness with an unhappy air of legal pedantry, and is not exact after all. And these two lines, spoken by Faust when bent on suicide—

Nach jenem Durchgang hinzustreben,
Um dessen engen Mund die ganze Hülle flammt—

are rendered by

Through the dread dark defile thy purpose follow,
Though at its mouth all Hell displays its oriflamme;

which, to speak plainly, is, for a translation that keeps the sense of the original at all, as bad a piece of work as we have ever met with. Take, once more, the beautiful and often-quoted lines at the beginning of the second scene in Faust’s study:—

Entschlafen sind nun wilde Triebe
Mit jedem ungestümen Thun;
Es reget sich die Menschenliebe,
Die Liebe Gottes regt sich nun.

What does Dr. Webb make of them?

Lulled is each passion, wild and erring,
And violence hath smoothed its brow;
The love of man within is stirring—
The love of God is stirring now!

This is poor altogether, but the second line is unpardonable. To make Goethe talk of violence smoothing its brow! That line alone, if there be any purgatory for translators, is enough to make Dr. Webb’s state exceeding parlous. It is a much less fault—to go back to the Earth-spirit—that “der Gottheit lebendiges Kleid” becomes the very commonplace “garb sublime.” Dr. Webb, moreover, seems to have a taste for odd words. *Flamboyant* we have already seen; he likewise gives us *antepast*, *gnarra*, and *undoyant*; this last, so far as we can discover, is a desperate epinage of his own to rhyme with *buoyant*, though in a place where desperate measures are excusable. Altogether, we fear that we are still a long way, for the sum of the help that Dr. Webb has given us, from the time when, in his own words, “under some happy conjunction of the planets, an English translator appears who has converted the German masterpiece into an English poem.”

But we are glad to be able to speak quite otherwise of Dr. Webb’s preface and notes. These show careful study of the poem and no small ingenuity. Not only are they likely to be useful to English readers, but they make various new points which future commentators on *Faust*—who will assuredly never be wanting—will do well to take account of. The critical notes on the translation of particular passages effectually disarm the facile superiority

assumed by Germans over the mere foreign student, by showing how much and how confidently the Germans differ among themselves. For our own part, we much doubt whether a native scholar necessarily has any advantage over a duly instructed foreigner when it comes to the interpretation of a really difficult passage, no matter in what language. Apart from questions of textual criticism, which here do not occur to any appreciable extent, it is a question of literary tact and sympathy with the author much more than of linguistic knowledge. We should ourselves be disposed to cut the knot in more than one vexed place of *Faust* by holding that Goethe purposely used vague or ambiguous language without intending to fix it to a precise shade of meaning. But we must turn to Dr. Webb's introduction. There are some very sensible remarks on the apparent mystery and incoherence of the plan of *Faust* as a whole. Goethe wanted to combine a plan that gave him free scope for his genius with a great mystification of the public.

He selected the story of the middle ages, whose adventures formed the nucleus around which the most popular of Teutonic myths had gathered. He avowedly made use of the story of *Faust* as Le Sage made use of the story of *Gill Blas*. It was a thread on which he could string what adventures he pleased. It enabled him to depict a number of little independent worlds. . . . He set the allegorists and the commentators going. . . . He wrote no preface and he vouchsafed no explanation. If he made any remarks upon the subject, his remarks were essentially misleading.

We have ourselves pointed out not long ago that much of the supposed obscurity of the Second Part vanishes on the application of considerations of this kind. It is simply the old *Faust* legend with the whole wealth of Goethe's imagination strung upon it; profoundly modified, indeed, by being made to conclude with *Faust's* salvation. Here there is a serious and continuous purpose, manifested in detail by the elaborate and almost antistrophic correspondence of passages in the closing scenes of the Second Part with phrases and passages in the First. In this connexion we must differ from Dr. Webb's opinion as to Mephistopheles's wager with *Faust*. That there is no wager in heaven we agree; when Mephistopheles says in the Prologue, "Was wettet Ihr?" it is an idle flourish. The reply he gets is not the acceptance of a challenge, but a bare license to go and do his worst on *Faust*, as he may on all men, so long as they live on earth. But we cannot agree that the wager with *Faust* is not seriously meant as such by Mephistopheles. No doubt he would also like, as Dr. Webb points out, to make sure of *Faust's* damnation, even to abundant caution:—

So hab' ich dich schon unbedingt . . .
Und hatt' er sich auch nicht dem Teufel übergeben,
Er müste doch zu Grunde gehn!

But this does not show that Mephistopheles does not rely on his wager too; and the proof that he does is that in the Second Part he thinks he has won it. We have only to compare the terms of the wager with the final event. *Faust* says to Mephistopheles:—

Werd' ich zum Augenblicke sagen:
Verweile doch! Du bist so schön!

Die Uhr mag stehn, der Zeiger fallen,
Es sei die Zeit für mich vorbei!

And Mephistopheles clinches the bargain:—

Bedenk' es wohl! Wir werden's nicht vergessen.

In the fifth act of the Second Part *Faust* does exclaim:—

Zum Augenblicke dürft' ich sagen:
Verweile doch! Du bist so schön!

and thereupon dies; in the short following dialogue between Mephistopheles and the chorus of Lemures, *Faust's* own words are pointedly echoed ("Die Uhr steht still. . . . Der Zeiger fällt. . . . Es ist vorbei"). Mephistopheles thinks himself safe, yet has a half suspicion of something amiss:—

Der Körper liegt, und will der Geist entfliehn,
Ich zeig' ihm rasch den blutgeschriebnen Titel;—
Doch leider! hat man jetzt so viele Mittel,
Dem Teufel Seelen zu entziehn.

Then comes the rescue by the heavenly host. Plainly Mephistopheles is meant to keep up his character of the mediæval Devil by being baffled in the regular mediæval fashion. As between himself and *Faust* the bet is won, or the condition of the bargain performed, whichever way we like to state it; but only in the letter. The moment to which *Faust* says "Verweile doch! Du bist so schön!" is not such a one as he thought of in his bargain. It is a moment, not of sensual or selfish pleasure, but of pleasure in well-doing to men. He has striven upwards to the better part, and made Mephistopheles himself his unwilling instrument therein. Hence the power of the deliverers to rescue him:—"Wer immer strebend sich bemüht, den können wir erlösen." As to the substance, we think we are at one with Dr. Webb in this. But he seems not sufficiently to recognize that in form the catastrophe is carefully built on the mystery-play model of a discomfiture of the Devil by something that in a worse cause would be counted for sharp practice.

On the dramatic structure of the First Part Dr. Webb is acute and instructive, though he makes one odd slip in saying that "the lengthened monologues of *Faust* render it incapable of representation on the stage." We should have thought it barely possible that Dr. Webb should not know the contrary to be an easily verified fact. The First Part of *Faust* is not unfrequently represented on the German stage, and that with a dramatic force which, after the lapse of several years, is fresh and vivid in the present writer's

memory. Of course extensive "cuts" have to be made both in the monologues and elsewhere, and even so the piece is a long one. But the same is true of Shakespeare's plays. Capable or not capable, the thing is done. This, however, is a mere passing remark of Dr. Webb's. His explanation of the minute chronology of the action is extremely ingenious; it puts some parts of the dramatic effect in a new light, and clears up some points which have formerly been taken as showing on Goethe's part either carelessness or forgetfulness of ordinary dramatic rules. An indication is expressly given in the text, but overlooked by some of the commentators, that the Walpurgisnacht follows closely on the slaying of Valentine. In the first scene, again, *Faust* speaks of the moon as at the full; on Walpurgis-night it is still waxing ("die unvollkommene Scheibe des rothen Mondes"). Hence Dr. Webb concludes that the whole action (down to the Walpurgis-night) must take place within three weeks; and, working out the time disposable for the loves of *Faust* and Margaret, he fixes the scene of Valentine's death to the very night following the last dialogue between *Faust* and Margaret in the garden. This reading not only makes the dramatic interest concentrated instead of diffuse, but gives a distinct significance, as Dr. Webb argues in detail, to every incident. One difficulty occurs to us which is not dealt with. When Valentine appears on the stage he not only knows that Margaret's fair fame is lost, but believes it to be notorious. How could this be the case in the narrow limits of time marked out by Dr. Webb? Still, it may well be that no possible reading will give us a scheme altogether free from difficulty. *Faust* is by no means the only great work of fiction in which the dispositions of time and place are more or less inconsistent; and the explanation which, without doing violence to the natural meaning of words and action, presents least difficulties on the whole will have a fair claim for acceptance. We will not offer a positive judgment on Dr. Webb's, but it certainly deserves attention.

THE SHORES AND CITIES OF THE BODEN SEE.*

A GOODLY volume on tolerably familiar districts, traversed in all directions by favourite tourist routes, appears, as Mr. Capper modestly remarks in his preface, a somewhat bold experiment. Without caring to open the book, we should be inclined to assume that it might be made up of trivialities eked out with padding. But if we had committed ourselves to a hasty judgment of the kind, we should have been greatly mistaken. Mr. Capper went about his work in a methodical way which cannot be too highly commended, as he had decided to come before the public as an author. He resided for a couple of years on the shores of the Bodensee or in villages in the neighbourhood. He associated chiefly with Swiss or Germans. He adopted their habits, and laid himself out to participate in their pursuits. He made excursions to all the objects of interest, and luxuriated in the scenery to his heart's content. In the course of his multifarious reading he made himself master of the local archæology, as of a history ancient, mediæval, and modern which abounds in strange and sensational incidents. And the result of his wanderings and literary researches has been the composition of a volume of varied interest, enlivened by his personal experiences and adventures. We have praised from the reader's point of view his manner of doing the country; and in all respects it is preferable to the more popular plan of scurrying about the world at express pace. Mr. Capper may perhaps carry his practice to an extreme; for life is shorter than in patriarchal times, when a couple of years might have been no excessive space for a tourist limiting his wanderings to Europe to devote to such a district as that of the Bodensee. For ourselves, we should always have had an uneasy sense of the immensity of the many inviting fields we were necessarily leaving unexplored. Yet we admit that such a lake as the Bodensee will well repay one for making leisurely acquaintance with it. We know it merely from flying visits; and were persuaded, even before reading Mr. Capper's book, that we had appreciated its attractions very insufficiently. For, apart altogether from their historical associations, the scenery of the Swiss lakes—and Constance is Swiss to all intents and purposes—grows upon one slowly, though surely, when the beauties are retiring rather than imposing. Thus nobody can fail to be struck at first sight with the stern picturesqueness of the Lake of the Free Forest Cantons, especially when the steamer is moving under the shadow of the precipices that overhang the Bay of Uri. Without carrying invidious comparisons further, we may simply say that Mr. Capper has shown that the relative tameness of Constance has a seductive witchery of its own; while in point of legend and historical romance it distances any possible rivals.

But though Mr. Capper dilates on archæology, history, and romance, before all he is eminently practical. It was his pleasure on the wet days and in the long winter evenings to ransack sources of information in type or manuscript that not unfrequently were comparatively inaccessible. But he writes in the first place for the tourists of the present, or rather of the future; and his chief purpose is to show by experience and example how economically a trip to the Continent may be made. The representative traveller of the past was the man born to a fortune, who went the tour of Europe in his car-

* *The Shores and Cities of the Bodensee: Rambles in 1879 and 1880.* By Samuel James Capper, Author of "Wanderings in War Time," &c. London: De La Rue & Co. 1882.

riage behind post-horses and indulged in the gaieties of society at each Court he visited. The tourists of the future will be the intelligent men of the masses; the school teachers and the better-educated clerks *et id genus omne*, who have but a few weeks to devote to their holiday at the utmost, and whose purses are light as their time is limited. Mr. Capper points out how these good people may make the best of their opportunities; and he strongly advises them to try Switzerland. The journey thither, to be sure, costs money; but once there they can enjoy themselves very cheaply. He recommends them to do as he did, and never attempt too much. He says very truly that if the object is to recruit the body as well as to relax the mind, there is no such mistake as over-exertion. Early starts and long days exhaust the strength and swell the expenditure. In the abundance of *pensions* kept at all prices, there need be no difficulty in finding comfortable headquarters; and in each town there are good second-rate inns, which will give the traveller little cause of complaint. There are *pensions* where you may fare sumptuously at eight or nine francs a day; as there are others, in less frequented localities, where you may find a good sleeping-room and a substantial table at a price not higher than four francs and a half. Mr. Capper practised as he preaches, and appears generally to have been fortunate. But we must add that he was certainly not over-fastidious, though he is very frank as to the shortcomings he found. Thus he had quartered himself one winter in the Pension Helvetia at Kreuzlingen, which is a suburb of Constance. The company that met at the daily dinner-table, though mixed, must have been agreeable enough; the guests were either men of some position, or, at all events, had seen something of the world. But the dining-room opened into the public *gaststube*, "where the small shopkeeper, or artisan, or travelling pedlar came in to get his glass of wine," and which was liable to be filled at any moment with the fumes of rank tobacco.

It is impossible to give even an outline in any detail of the narrative of this busily indolent two years' residence. We can merely select a passage here and there to give some notion of how Mr. Capper employed his time, and of the information he collected in the course of his peregrinations. He found Constance to be disagreeable winter quarters, so far at least as the climate was concerned. Heavy vapours hung habitually over the skirts of the lake, clouding the views and chilling the air, while the sun was shining brightly and warmly on the heights behind. But in that almost unprecedentedly severe winter of 1879-80, the people held an ice-carnival on the frozen lake. Parties of skaters made constant excursions from the one shore to the other, and there is one afternoon in especial that lives in Mr. Capper's memory. "The sun shone brightly from a perfectly blue sky; it was 4.30 P.M. when we took to the deep-green ice, which was so smooth that skating seemed no exertion whatever, but was like flying." The skaters had grand views of the fantastic mountain peaks, set off by the splendours of the setting sun, as they flew over the purple expanse of ice. What struck him especially in those flying ice excursions were the various fishing stations dotted over the surface. The fisherman provides himself with a screen of wood and straw, which he pushes before him upon runners to some spot that is known to him as a favourite resort of the fish. There he cuts a hole, draws off his boots and skates, disposes his feet in a pad padded with straw, and, dropping his bait into the water, waits patiently for a bite. After all, though he occasionally lands a trout, the prizes he makes in ordinary are principally a small species of perch. Mr. Capper found Rorschach a pleasant summer resort and a very convenient centre for interesting excursions. Instead of going to the "Seehof," which has a high reputation and deserves it, he put up at the more modest establishment of "The Green Tree," where the bedroom at least, according to his description, seems to have been bright and coquettish enough to please anybody. Among the most interesting of the expeditions he made from Rorschach was one to the annual *Landsgemeinde*, or popular assembly, of one of the two divisions of the Canton Appenzell. The people's Parliament was held at Trogen. It impressed him greatly to see those comfortably-dressed, decently-behaved Republicans voting the election of Ministers, magistrates, &c., by the popular acclamation of some five thousand voices, having solemnly prefaced the proceedings by a church service, and a "grand old hymn" sung in general chorus. At present the shores of the Bodensee are singularly flourishing. Many of the towns are famous all the world over as the seats of thriving manufactures; while the land generally is owned by peasants, or small farmers, or by the communes whose members labour hard and take a pride in economizing. In old times the lot of the lower classes was a very different one, and it is no wonder that those on the Swiss side hold to their Republican institutions after their fathers' experience of the tyrannies of the seigneurs. When the peasants and serfs revolted against the lords there was nothing to choose between the brutalities perpetrated on the one side and the other. But never, of course, did the unfortunate people endure a period of more protracted misery than during the long vicissitudes of the Thirty Years' War, when Catholic troops and Protestants, Imperialists, Swedes, and French, successively held possession of the country; and when the soldiers who came in the guise of friends were as ruthless in their outrages as avowed enemies. By way of illustrating the horrors and sufferings of the times, we are referred to the extracts from the remarkable diary which Bûrster, a monk of the monastery of Salem, near Ueberlingen, has left behind him. But what impresses us nearly as much as the good fathers' capacity for

endurance are the indirect evidences of their immense wealth. After having been mercilessly pillaged time after time; after the levying of forced contributions by one set of combatants after another; after entertaining wasteful soldiers by the hundred at free quarters in the convent for weeks, or even months, on a stretch, there still seem always to have been money or supplies forthcoming, however bitter may have been the complaints at parting with them under coercion.

Mr. Capper passed a summer and an autumn with his wife and children at Seewis in the Prättigau, which is a district, or rather a valley, lying to the left of the Rhodanthal as one ascends it from the Lake of Constance. His report of that secluded health-resort is so very favourable that many of our countrymen to whom it has been hitherto almost unknown may be tempted to try it as a sojourn. We hear of a friendly and liberal host, cheap and comfortable quarters, civil villagers, glorious air, delightful walks, and beautiful scenery. There are magnificent excursions to be made in the neighbouring mountains, some of which form the boundaries between Austria and Switzerland; and on one of these Mr. Capper with a party of friends had something approaching to a series of adventures. At Seewis, as usual, he made the most of his opportunities in the way of informing himself as to the circumstances of the natives. Seewis is a relatively wealthy commune, and certainly its inhabitants must be in very easy circumstances. It was nearly burned down and almost entirely rebuilt seventeen years ago, and the houses accordingly have gained in comfort all that they lost in picturesqueness. The commune possesses extensive forests, the money value of which, however, is rather illusory than real, since the proprietors dare not cut down their shelter from the mountain winds and avalanches. Every house is surrounded by its orchard; each citizen has his allotment of the public arable land, held on a life-tenure, with the right of grazing on the Alps for his sheep and cattle. There must be money to spare, too, in the public treasury, for the commune lately bought the old feudal castle, which they have transformed and deformed into a hideous town hall. Although Mr. Capper remained with his family at Seewis till the 5th of December, they enjoyed until then, instead of frost and snow, "an almost unbroken Indian summer of almost perfect beauty." Such weather may probably have been exceptional; but it seems certain that Seewis in many respects must be at least as desirable a residence for invalids, even in the depth of the winter, as the more fashionable Davos, still higher up among the hills, in which lies the picturesque valley of the Landquart.

DR. WORTLE'S SCHOOL.*

THE metaphor which compares a novelist to a cook is perhaps as hackneyed as it is irreverent; but the practices of certain very notable, and, it may be added, very agreeable, practitioners of the novelist's art make the repetition of it almost unavoidable. As the skilful artist of the kitchen works up his comparatively limited materials into fresh compounds, differing a little in composition, and very much in title, so does the novelist; and as the *salade Berlinoise* of one year brings to the palate something more than a reminiscence of the *Mayonnaise Bag-and-Baggage* of the year before, so is it with the books which the novelist's readers affect. Nobody, therefore, ought to be very much surprised or even greatly aggrieved if a masterful clergyman who is perpetually waging polite war with his Bishop, another clergyman who is under a cloud and has a faithful wife, a small mystery cleared up by a rapid journey to the ends of the earth, and an amiable young nobleman who is faithful to a girl somewhat below him in station, present themselves once more in *Dr. Wortle's School*. Indeed, Mr. Trollope has more claim to originality than the artist to whom we have compared him, because, if his mixture is something of a "mixture as before," at any rate his ingredients are his own genuine inventions. The doctrine of copyright in ideas has hitherto been limited to the arts of design, but there is no reason whatever for refusing to extend it to literature.

If, however, *Dr. Wortle's School* cannot be said to show any claim on Mr. Trollope's part to the distinction of infinite variety, let us hasten to say that it certainly does not expose him to the charge of staleness. Attentive students of fiction know that the goodness of the work of assiduous novelists is very often in inverse proportion to its size. *Dr. Wortle's School* hardly deserves the position of a full-grown novel, and its two slim volumes do not contain much more than half or a third of the quantity usual in such novels. But the earlier part of it at least is as brightly and pleasantly written as anything that the author has done, and exhibits his mannerism—limited and somewhat tricky as that mannerism is—in a very favourable light. The end is not good, and seems somewhat huddled up; but the story goes off with great spirit, and, as Mr. Trollope ingenuously tells his readers all about it in the first few score pages, the usual bashfulness which prevents reviewers from giving arguments of novels hardly applies here. Dr. Wortle is a sufficiently distinguished scholar with a will of his own, and a consciousness of the side on which his bread is buttered. He has left his college, has taken a living, and has combined with that living a preparatory school where the charges are very high, and of which the reputation is proportionately great. When the story opens, twenty-eight happy youths are boarded,

* *Dr. Wortle's School*. By Anthony Trollope. 2 vols. London: Chapman & Hall, Limited. 1881.

lodged, washed, &c. under Dr. Wortle's roof, and their pleased parents requite the Doctor with sums varying from two hundred to two hundred and fifty pounds yearly. Nor let any reader suppose that this ingenious combiner of the cure of souls with the care of youth is a charlatan. Dr. Wortle is represented as a somewhat worldly but thoroughly honest and honourable man, giving everybody full *quid* for their *quo*; of a generous spirit, and capable of making his parish a model parish at the same time that he makes his school an exceedingly profitable school. Only he has a certain affectation of contempt for spiritual zeal which brings him into loggerheads perpetually with his bishops, whom he invariably routs, and who naturally do not love him any the more therefore. Nor is he without other enemies, notably a certain Mrs. Stantiloup, with whom he has had to fight in her capacity of parent, and who hates him with a deadly hatred. Now the experienced reader who knows the ways of schoolmaster-parsons will perceive at once that it is an object with Dr. Wortle to unite as far as possible the two kinds of assistants that he requires, assistant-master and curate, in one person, and that it is not easy for him to do so, more especially as he also desires to get out of this assistant's wife certain other assistance of the matron character. At the date of the story he has got a phoenix, or a pair of phoenixes, if that were possible. Mr. Peacocke has been a Fellow of his college; he has taken the highest honours; he has an American wife who is not only a charming lady, but who is quite willing to look after the boys maternally and spare Mrs. Wortle. The Doctor would be able to say *quis me uno felicit?* but for a little hitch about the curacy. Mr. Peacocke is rather shy of this complication of duties, and it shortly becomes apparent that if he were not shy the reigning Bishop would see in the circumstance an opportunity for playing a return match with Dr. Wortle. Between the time of his leaving Oxford and the time of his coming to Dr. Wortle, Mr. Peacocke has spent five years in America, and of his history during those five years, of the antecedents of Mrs. Peacocke, &c. &c., nothing whatever is known. The Bishop puts it to Dr. Wortle whether he can be expected to license a man in whose *livret* there is such a singular gap, and suggests with a proper episcopal mixture of mildness and severity that the gap shall be filled. The reasonableness of this point of view is insisted upon by Mr. Puddicombe, the parson-confidant of somewhat narrow mind, but upright and not unkindly disposition, whom also we have met a few times in Mr. Trollope's books. So the Doctor very unwillingly requests his phoenix to give an account of himself during his last stay in the desert, and the phoenix acknowledges with commendable frankness that he is unlike the knife-grinder, and has a story to tell. A delay of a few days is agreed upon, during which it is to be decided whether this story is to be told or not. What the story is, Mr. Trollope very obligingly tells his readers at once—a frankness in which we shall not imitate him. Suffice it to say that the wisdom of the axiom, "Shun delays, they breed remorse," is justified anew. Before the story can be told to Dr. Wortle's friendly ears it is told to other ears, friendly and unfriendly, by lips of the most unfriendly kind; and one of Mr. Trollope's favourite difficulties is comfortably established. Of course it comes all right; Mr. Trollope's difficulties always do come right, unless that of *The Small House at Allington* may be said to be an exception. But both Dr. Wortle and Mr. Peacocke—the former altogether undeservedly, the latter with a proportion of desert which will be judged differently by the strait-laced and the loosely girt in matters ethical—have to undergo a period of considerable tribulation. This involves a sharp fight with the Bishop, and the preliminaries, at least, of a sharp fight with a London newspaper of the scandal-mongering sort. Mr. Trollope's account of the estimable periodical which he calls "Everybody's Business" is very sprightly and by no means ferocious, and his correspondence between Dr. Wortle and the Bishop deserves a good deal of praise.

The merit, indeed, of *Dr. Wortle's School* consists chiefly in details of this kind. The conduct of the story, and not the story itself, is evidently the point to which the author has wished to draw his readers' attention; and he has succeeded very fairly. The wrath of a respectable elderly clergyman, of a somewhat high and dry school, when he finds the occupations of his day described by a brisk scribe as beginning "with a hot morning at tennis and winding up with *amo* in the cool of the evening," is thoroughly naturally imagined and described. The simultaneous backing-out of half a dozen week-kneed parents, who all discover that their darlings are prevented from joining or rejoining Dr. Wortle's flock by the most ingeniously diverse causes, as soon as the breath of scandal has begun to blow upon the establishment, is another episode handled in the easy natural manner which is Mr. Trollope's chief merit, and in which, whatever fault may be found with its truth to anything below the surface, few of his younger rivals have equalled him. The description already referred to of "Everybody's Business" is perhaps the best thing of this kind in the whole book, and it is worth quoting, especially as, while it is as happy in expression as Mr. Trollope usually is when he does not meddle with things too high for him, it is a good deal more serious in meaning:—

"Everybody's Business" was a paper which in the natural course of things did not find its way into the Bowick rectory; and the Doctor, though he was no doubt acquainted with the title, had never even looked at its columns. It was the purpose of the paper, as its name declared, to amuse its readers with the private affairs of their neighbours. It went boldly about its work, excusing itself by the assertion that Jones was just as well inclined to be talked about as Smith was to hear whatever could be said about Jones. As both parties were served, where could be the objection? It was in the main goodnatured, and probably did most fre-

quently gratify the Joneses, while it afforded considerable amusement to the listless and numerous Smiths of the world. If you can't read and understand Jones's speech in Parliament, you may at any rate have mind enough to interest yourself in the fact that he never composed a word of it in his room without a ring on his finger and a flower in his buttonhole. It may also be agreeable to know that Walker the poet always takes a mutton chop and two glasses of sherry at half-past one. "Everybody's Business" did this for everybody to whom such excitement was agreeable. But in managing everybody's business in that fashion, be the writer as good-natured as he will, and let the principle be ever so well founded that nobody is to be hurt, still there are dangers. It is not always easy to know what will hurt and what will not. And then sometimes there will come a temptation to be, not spiteful, but specially amusing. There must be danger, and a writer will sometimes be indiscreet. Personalities will lead to libels even when the libeller has been most innocent. It may be that, after all, the poor poet never drank a glass of sherry before dinner in his life. It may be that a little toast and water even with his dinner gives him all the refreshment that he wants, and that two glasses of alcoholic mixture in the middle of the day shall seem, when imputed to him, to convey a charge of downright inebriety. But the writer has perhaps learned to regard two glasses of meridian wine as but a moderate amount of sustentation. This man is much flattered if it be given to understand of him that he falls in love with every pretty woman he sees, whereas another will think that he has been made subject to a foul calumny by such insinuation.

This is perhaps too much of a "gentlemanlike correction" for a monstrous and disgusting evil. But it must be acknowledged to be to the point, even if some of us think that the method of Swift might be more appropriate to the subject than the method of Addison.

The weakest part of the book is the love affair between Lord Carstairs and Mary Wortle. It is the weakest not because it is episodic—for, as a matter of fact, it has a good deal to do with the *dénouement*—but because there is not sufficient space given to the display of the characters and fortunes of the lovers. That a mere third murderer (in respect of importance, for Lord Carstairs is a wholly estimable young man *per se*) should propose to, and should be left in good hopes of marrying, a mere third murderess (in this case also the phrase is purely metaphorical), is a fact which can only give satisfaction to the modern representatives of Miss Martha Buskbody. It may be true that in the space which Mr. Trollope has given himself it would not have been easy to develop Carstairs and Miss Wortle into something higher than third murderer and third murderess; but then the only marriage-bells in a modern story deserve more elaborate prelude than this, and for such a prelude space ought to have been made.

MINOR NOTICES.

THE many readers and admirers of *A Week in a French Country House* (1) and other already published works by the late Mrs. Sartoris will welcome eagerly the appearance of two volumes which contain some papers with which they will gladly renew, and others with which they will gladly for the first time make, acquaintance. The volumes are edited by Mrs. Sartoris's daughter, Mrs. Gordon, and are introduced by her with a preface which differs from many prefaces in being interesting. In this special attention is given to "the unfinished history of 'Judith,'" which, as we gather from the context, is the only part of the volumes which has never been in print before, although some of the other contents are new to us. The preface tells us that "it was my mother's intention to portray in her [Judith] a great and noble character, led astray by the very qualities that had ennobled it." Judith, after the early trials which we are fortunate enough to have recorded for us, would have "become a great artist and public singer, crowned with success, and the admired of all." She would have been in the end "more sinned against than sinning," led into error which would have brought with it its own punishment. "The story would have been a sad one enough, ending with Judith's death, lonely and unhappy, with only one or two friends left her; but we should have had the history of a noble woman who, in spite of triumphs, sin, and sorrow, retained her truthful and unworldly nature to the last." No one acquainted with Mrs. Sartoris's writings is likely to doubt that this scheme would have been finely worked out, or to fail to regret that it was not so worked out; but, accepting the fact that only a fragment of Judith's history could be given to us, we may perhaps be glad that this fragment depicts in some sense the brighter part of her life. She stops, as we know her, far short of the grand successes which awaited her, and she has many petty and wearing insults and annoyances to endure; but the brightness of her half-developed nature carries her through these, and we are left to delight in the child's attractive qualities without having to mourn over the troubles which they would have brought to the woman. When we are first introduced to Judith she is sitting, unobserved, as she thinks, in a summer-house, trying to teach a mongrel dog, who is her devoted friend, to howl in tune to her singing. "The dog, with an almost human endeavour, pitched his voice to hers, and at last made the unison perfect. . . . She placed a daisy crown upon his head, and a sceptre of foxgloves between his paws, and then, sitting back upon her heels, contemplated him with ecstasy, exclaiming with accents of rapturous tenderness, 'Oh, darling! how clever you are! Could you really be the devil, darling?'" Judith, charming and loving as she is, is far from being the only real and interesting personage, charming or not, who appears in what unhappily is only the beginning of her history. It was, indeed, Mrs.

(1) *Past Hours*. By Adelaide Sartoris (Adelaide Kemble). 2 vols. London: Bentley & Son.

Sartoris's merit that every one of her characters, prominent or not, bore about him or herself the stamp of reality, of being, that is, an artistic study, not a mere and dull copy from life. The author's skill in this regard is perhaps most remarkable to the student of fiction in the case of such a character as Leslie in *Judith*, a character which might well be colourless enough, but which in Mrs. Sartoris's hands promised to become something very different from the ordinary stick of a hero, without being in the least unduly accented. The author had already shown her complete command and delicate touch in dealing with "character-parts," and the delightful "Jacky" of *Judith* is another proof of this command. It is perhaps hardly necessary to cite any special instance of Mrs. Sartoris's fine power of observation, and of not ill-natured satire; but there is one passage in *Judith* which is a signal instance of this. "There are people," she wrote, "who know how to make familiarity respectful; and there are others who contrive to make an action, deferential in itself, unduly familiar; Leicester Montagu always managed the latter; but vulgar women, who constituted the chief of his *clientèle*, thought all his little underbred graces quite too delightful. He gave bread and butter so once to Lady Adela, who remarked audibly to her next neighbour, 'I should like to set my foot in his chest.'" We do not propose to anticipate the pleasure of readers by giving any detailed account of the contents of two small volumes which are delightful for their fine sense of many sides of human emotions and manners; but we cannot resist quoting one passage which displays Mrs. Sartoris's power of conveying in words what is an exceptionally difficult thing so to convey—the effect produced by the performance of a singer of a past time. Writing of a certain oratorio Mrs. Sartoris said:—"A little thick-set man, with a light-brown wig all over his eyes, a generally common appearance, and most unmistakably Jewish aspect, got up to sing one single line of recitative." After going through some undignified and even comic preparations for his effort, "he said, 'But the children of Israel went on dry land,' and then he paused; and every sound was hushed throughout that great space; and then, as if carved out upon the solid stillness, came those three little words 'through the sea.' And our breath failed, and our pulses ceased to beat, and we bent our heads, as all the wonder of the miracle seemed to pass over us with those accents—awful, resonant, radiant, triumphant!" No description which we have before read of Brahms's singing has given us so evidently true and complete an idea of the genius which triumphed over his faults.

An antiquary of some local repute, the late Mr. Robert Davies, read a series of papers descriptive of walks through the streets of York before the members of the Yorkshire Philosophical Society and the York Institute in the years 1854 and 1855. After an interval of a quarter of a century his widow has gathered these papers together and published them in a volume (2). The plan which Mr. Davies adopted in his lectures was perhaps well suited to a local audience. He professed to conduct his hearers on an imaginary walk from some one point of the city to another, as from Burton Stone to Jewbury, or from St. Leonard's Cloisters to Clifford's Tower, gossiping on the way about the old buildings, their history, and the men and women whose memories are associated with them. To persons familiar with the ground traversed the method adopted was doubtless sufficiently attractive; it is ill adapted for readers who do not know the city, or who are only imperfectly acquainted with it. To them the book is only a collection of shreds and fragments of local history, and they will have to look elsewhere for the record of that greater past which lends a kind of pathetic interest to the small details of an inglorious present. For the city of Hadrian and Severus, the ancient capital of Northumbria, the seat of the first English Parliament, and the place which at one period appeared destined to become the metropolis of the kingdom, has sunk into comparative insignificance during the last three hundred years, and no memorable events have occurred to break and vary the tame monotony of its existence. Mr. Davies moves patiently along the once-famous scenes, and tells how this historic mansion has been inhabited by a succession of mayors and aldermen, and how that old hall has passed into the hands of a series of respectable doctors or tradesmen; he takes note of vicissitudes, decay, and disappearances. The work, so far as it goes, is carefully done; it describes a few curious customs and bygone manners; and, as a contribution to local history, the thing was perhaps worth doing. The local enthusiast, however, can alone properly appreciate it, and it is not likely to interest a wider circle.

Mr. George Meredith was hardly in his happiest vein when he wrote *The Tragic Comedians* (3). He is an author who has been fanciful and brilliant (as in that ever-fresh and ever-delightful work *The Shaving of Shagpat*), brilliant and incisive, or brilliant and eccentric, or all three, clever, difficult, and even crabbed by dint of cramming too much cleverness into too small a space (as in some of his novels), but never until now dull. Possibly the unreality, eccentricity, and dullness of *The Tragic Comedians* are due to his having deliberately taken a real story, which there was certainly no need to revive, and having given his own notion of what were the probable emotions which produced events that actually happened. The story is in itself ordinary enough. A violent and intellectual Radical Jew falls in love with

the intellectual daughter of an aristocratic German officer, who not unnaturally objects to the proposed alliance. Partly by dint of family pressure, partly by dint of misunderstanding due to the Jew Radical's own foolishness, the girl finally rejects his offer, after having made a considerable effort to assert her right to accept it. The Jew Radical writes a letter which we are led to infer is so outrageously vulgar, violent, and offensive, as to fully warrant his being called out by the girl's former and half-accepted lover, whose birth, education, and views are not unsuitable to hers. He goes out and is shot dead, after which the girl, "like a well-conducted person," marries the man who shot him. Of the strange style in which this not very strange story is set forth one specimen may be enough:—

She was like a lady danced off her sense of fixity, to whom the appearance of her whirling figure in the mirror is both wonderful and reassuring; and she liked to be discussed, to be compared to anything, for the sake of being the subject, so as to be sure it was she that listened to a man who was a stranger, claiming her for his own; sure it was she that by not breaking from him implied consent, she that went speeding in this magical rapid round which along her more and more out of her actual into her imagined self, compelled her to proceed, led her the right to faint and call upon the world for aid, and catch at it, though it was close by and at a signal would stop the terrible circling.

Mr. Stirling's two volumes of theatrical recollections (4) contain, apart from the interest of his own early experiences when the London stage was a very different thing from what it now is, a quantity of amusing and interesting facts and anecdotes, new and old. The book is not one to be read through at a sitting, any more than a dictionary is; but it is one which may be taken up in a spare quarter of an hour or half-hour with a tolerable certainty of lighting upon something of interest.

The always welcome *Era Almanack* (5) has this year a novel and special feature in illustrations contributed by players, under the punning title "How Actors Draw." Many of the sketches have much artistic merit. The remainder of the volume is well up to the mark.

The new edition of *Dod's Peerage, Baronetage, and Knightage* (6) is edited with that profusion of minute care and skill which is apt to pass unnoticed because people have come to expect it as a matter of course.

From the same publishers we have the invaluable *Parliamentary Companion* (7). A notice issued with this informs us that "the close balance of parties has rendered much vigilance necessary in recording the politics of each Member. In all possible cases the exact words of the Member himself have been preferred to any other statement of his political opinions."

The twelfth annual issue of *The Australian Handbook* (8) is a volume containing a mine of useful information of the most varied kind, of the extent of which it is impossible to give an adequate idea within brief limits. To take a few instances, the very fullest and most practical information is given to intending emigrants in some well-considered pages, which, however, are but a very small part of the whole volume. Outfit, diet, medical stores, what is or is not forbidden by the ship regulations, what are the everyday difficulties of the voyage, and how they can best be met—all these things are discussed in a sensible and helpful way. At a few pages' distance the emigrant who has "made his pile" and comes back to enjoy himself will find equally full information as to the best hotels to stop at, the best clubs to join, and the current amusements. "To which," as the old announcements had it, "is added" some general information as to cab fares. The book contains an excellent map of Australia and New Zealand.

We learn from Mr. Waddington's preface to his selection of sonnets (9) that two former selections, which have appeared during recent years, did not include the sonnets of living writers. It was a happy idea on Mr. Waddington's part to supply this deficiency, and give us this volume of carefully chosen work. The book will, as he suggests, "enable readers and students of poetry to compare the work of the poets of our own time with that of the many generations which have passed away since the Earl of Surrey and Sir Thomas Wyatt wrote the first English sonnets." The selection made by Mr. Waddington is a singularly attractive one, and its value is enhanced by the interesting "Note," as he modestly calls it, on the history of the sonnet which is appended to the volume.

The collection of poems and music (10) by the late Miss Evans, to which Mrs. Ritchie has prefixed a graceful "Memorial Preface," is full of interest. Both in music and in verse Miss Evans had a fine taste and a delicate touch. Of this there is remarkable evidence in the "Words to a Lied ohne Worte (Allegro non troppo, in C Minor, Book III. Ed. Pauer)," which is a good deal more than a strikingly successful *tour de force*. Less successful in this

(4) *Old Drury Lane: Fifty Years' Recollections of Author, Actor, and Manager*. By Edward Stirling. 2 vols. London: Chatto & Windus.

(5) *The Era Almanack for 1881*. London: "Era" Office.

(6) *Dod's Peerage, Baronetage, and Knightage for 1881*. Forty-first Year. London: Whittaker & Co.

(7) *Dod's Parliamentary Companion*. London: Whittaker & Co.

(8) *The Australian Handbook (incorporating New Zealand, Fiji, and New Guinea) and Shippers' and Importers' Directory for 1881*. London, Melbourne, Sydney, and Brisbane: Gordon & Gotch.

(9) *English Sonnets by Living Writers*. Selected and arranged, with a Note on the History of the Sonnet, by Samuel Waddington. London: Bell & Sons.

(10) *Anna Evans: Poems and Music*. With Memorial Preface by Anne Thackeray Ritchie. London: C. Kegan Paul & Co.

(a) *Walks through the City of York*. By Robert Davies, F.S.A. Edited by his Widow. London: Chapman & Hall, Limited. 1880.

(3) *The Tragic Comedians: a Study in a well-known Story*. By George Meredith. 2 vols. London: Chapman & Hall, Limited.

way is the French song "Garçon volage," which was unluckily written in disregard of the arbitrary laws of French verse. We select for quotation one among the shorter poems, called "Blackbird":—

Singing loud and singing gay
Mid the dewy dawning,
Blackbird welcomes in the day
Under his green awning;
Welcomes in the rising day,
While the shadows haste away,
Singing loud and singing gay
Mid the dewy dawning.

Singing sweet and singing clear
While the day is waning,
Blackbird spreads a pensive cheer
Through the light remaining;
Spreads a calm and pensive cheer
Through the stillness far and near,
Singing sweet and singing clear
While the day is waning.

In the preface will be found some very interesting fragments, among which is a collection of "Possible Meanings of Some Common Phrases." For instance, "Nice people" are "People who always behave like other people," and "A domestic woman" is "A woman like a domestic."

Mr. Dickens has made an important addition to his admirable series of useful "dictionaries" in the *Dictionary of Days* (11), which "gives a concise history, day by day, of the principal events of general public interest which occurred, throughout the world, in 1880." The mass of varied and useful information here arranged in the most convenient way possible would be amazing but for the proofs already given by Mr. Dickens of his talent for organization.

A second and improved edition has been issued of *The Natural Wonders of New Zealand* (12), containing information as to the Hot Lake District which could not be procured when the first edition appeared.

A second edition has appeared of Mrs. Heaton's *Life of Albrecht Dürer* (13). The first edition was published eleven years ago or thereabouts, and since that date new and interesting information concerning the subject of the book has been forthcoming. In 1870, for instance, as we learn from the preface to the second edition, Dr. Lockner of Nürnberg "published a valuable monograph on the personal names mentioned in Dürer's letters from Venice. These names, most those of old patrician families in Nürnberg, had in many cases misled previous translators." Other interesting contributions to the subject have been made by Dr. Max Allihn, Herr Adolf Rosenberg, Dr. Alfred von Sallet, Herr von Rittberg, and Professor Sidney Colvin. "But by far the most important additions to our knowledge have been made by Professor Moritz Thausing, who has subjected Dürer's life, writings, and artistic work to a critical analysis that had not previously been attempted." Mrs. Heaton has made judicious use in her second edition of all the further information here indicated. In the case of Professor Thausing she often differs from his "conclusions, his theories seeming to me to be sometimes as baseless as those he overthrows; but this does not prevent me from acknowledging the great value of his work, and the scientific manner in which it has been performed."

ADVERTISEMENTS.

THE GROSVENOR GALLERY.

WINTER EXHIBITION.

The GROSVENOR GALLERY Exhibition of Water-Colour Drawings, and Decorative Designs, by living Artists, NOW OPEN
Daily, Ten to Six.

Admission, 1s. Season Tickets, 5s.

DORE'S GREAT WORKS, "CHRIST LEAVING THE PRETORIUM," "CHRIST ENTERING JERUSALEM," and "MOSES BEFORE PHARAOH," each 33 by 22 feet, with "Dream of Pilate's Wife," "Christian Martyrs," &c. at the DORE GALLERY, 35 New Bond Street. Daily, Ten to Six. 1s.

ROYAL AGRICULTURAL COLLEGE, CIRENCESTER.

For the Science and Practice of Agriculture.
For intending Land Owners and Occupiers, Land Agents, Surveyors, Colonists, &c.
The R.A.C. Farm, surrounding the College, is a mixed farm of about 500 Acres.
Chairs of "Committee of Management." The Right Hon. the Earl of DUCIE.
For Prospectus of College and Farm, List of Scholarships, Prizes, Diplomas, &c., apply to the PRINCIPAL.

THE MISSES A. & R. LEECH'S SCHOOL for LITTLE BOYS will RE-OPEN on Tuesday, January 25, at 65 Kensington Gardens Square, Hyde Park, W.

LEAMINGTON COLLEGE. The NEXT TERM begins January 26th. Scholarships lately gained at Balliol, Queen's, Clare, Trinity Hall, Proving for the Hertford. Twelve Certificates in July last in Public School Examinations. In the Junior School Boys are admitted at the age of Eight, and are prepared for Scholarships in this and other schools. Special attention paid to the elementary instruction of little boys. Apply, Rev. Dr. WOOD, College, Leamington.

BRIGHTON COLLEGE.

The NEXT TERM will commence on Tuesday, January 25, 1881.
F. W. MADDEN, M.R.A.S., Secretary.

ISLE OF WIGHT PROPRIETARY COLLEGE, Limited.

Head-Master, the Rev. F. D. TRESDALE, M.A., Scholar of Winchester and New College, Oxford, late Head-Master of the Northern Counties College, Inverness. The College, Oxford, will commence on Friday, January 26, on which day it is expected that all boys will be at the College at 5.30 A.M.—All particulars may be obtained from the Secretary, T. R. OWEN, The Cottage, Melville Street, Hyde.

S. PAUL'S COLLEGE, STONY STRATFORD.

Warden-chief—Rev. H. W. MCKENZIE, M.A., Oxon, late Sub-Warden of S. Paul's. A PUBLIC SCHOOL in accordance with Church of England Principles. Terms, Sixty Guineas.—Full particulars on application to the WARDEN. The NEXT TERM begins January 19.

BRUCE CASTLE, TOTTENHAM.

Head-Master—Rev. W. ALMACK, M.A.
The main features of this School are its extreme healthiness, convenient buildings, and extensive grounds (20 acres), its system of education (which provides for special as well as ordinary requirements), and the thorough domestic care and organization. Few schools have greater natural advantages.

STRATFORD-ON-AVON.—TRINITY COLLEGE SCHOOL.

The Warden, RICHARD F. CURRY, M.A., is assisted by Seven Resident Graduate Masters. Special attention paid to Modern Languages. Classical and Modern Bides, Junior Department for Young Boys. Exhibition to the Universities. Large Playing Fields, Gymnasium, Fives Courts, &c. Terms, 60 and 80 Guineas. Apply to the WARDEN.

PERCEVAL HOUSE SCHOOL, BLACKHEATH, S.E.

Principal—WM. KIESER, M.A.
The NEXT TERM will commence on January 25.

ST. EDMUND'S COLLEGE, SALISBURY.—A HIGH-

CLASS SCHOOL for SONS of GENTLEMEN. The religious training is upon definite Church principles. Boys are Educated with much care and thoroughness. They receive individual teaching and help wherever needed. Candidates for Matriculation at the Universities are specially prepared. Terms, 45s a year.—For references, prospectus, or any further particulars, apply to the Warden, Rev. G. H. BOURNE, D.C.L.

STIFFORD'S BRIDGE, MALVERN.—Thorough PRIVATE

EDUCATION, in a large country house, is offered on moderate terms to a few GENTLEMEN'S SONS willing to read.—Address, J. C. GAWTHRAN, M.A., Oxon.

CHIGWELL GRAMMAR SCHOOL, Founded 1629, on the

borders of Epping Forest, offers a sound EDUCATION on the system of the Modern Side of the Public Schools.—Apply to Rev. R. D. SWALLOW, M.A., Head-Master.

MR. WILFRID WRENCH, B.A., New College, Oxford,

receives a few PRIVATE PUPILS preparing for the Army, Universities, or other Competitive Examinations.—Address, Glendon, Surbiton, Kingston-on-Thames.

CARSHALTON HOUSE SCHOOL, Surrey.—BOYS carefully

prepared for Civil and Military Examinations.

BIRKENHEAD SCHOOL.—Head-Master, Rev. J. T. PEARSE,

M.A., formerly Scholar of Trinity College, Cambridge, and Bell's Scholar. School Buildings standing in six acres of ground in a most healthy, elevated situation. Accommodation in the Head-Master's house for Forty Boarders. Classical and Modern Departments.
NEXT TERM begins January 19.—For further information apply to the Secretary, W. E. MILLS, 40 Hamilton Square, Birkenhead.

COERCION AND OBSTRUCTION.

THE consecrated fictions of politics deserve a certain respect, if only because they impose on the Parliamentary and official imagination. Mr. FORSTER was thoroughly in earnest when he declared that he would never have accepted his present post if he had foreseen the necessity for enlarging the powers given to the Executive by the ordinary law. Sir STAFFORD NORTHCOTE, with equal sincerity, announced that it was painful to all parties to support a Protection Bill, though, as he added, such legislation was the kindest thing that could be done for Ireland. It ought not to be painful to act with kindness to any part of the United Kingdom; nor should a Minister shrink from the primary duty of protecting life and property. The real cause for regret is that a state of things should exist in Ireland which was accurately and moderately described by Mr. FORSTER. It is a melancholy fact that the Land League has established, by means of terror, a lawless despotism in Ireland. The task of abating its tyranny is difficult, but it ought to be undertaken without a trace of compunction. Mr. FORSTER asserts that the outrages which are instigated by the Land League are executed by a limited number of notorious ruffians who constitute the police of the organization. Judging by former experience, Mr. FORSTER anticipates that some of the agents of the League will leave the country; others will, under the powers of the Bill, be committed to prison; and the residue will perhaps suspend their criminal activity. None of these results will disturb the complacency of reasonable and peaceable subjects, although they cannot be produced without exceptional legislation. All criminal law interferes with the general principles of freedom. It is a strong measure to keep a man for several years in penal servitude, and it is still more anomalous to hang him; yet it is one of the chief objects of civil society to bring offenders to punishment. If the machinery which may have been devised for the purpose falls out of gear, substituted or additional contrivances are not less legitimate than the ordinary criminal law.

Mr. FORSTER proved, and it was already certain, that obedience to the Land League, and even enlistment in its ranks, are enforced by cruelty and by terror. It is of this state of affairs, and not of attempts to redress scandalous abuses, that administrators and legislators should be ashamed. The persons who will be subject under the provisions of the Bill to a mild form of imprisonment probably well deserve penal servitude. It would be satisfactory that they should meet with their deserts by the verdict of juries, founded on legal evidence; but, if juries are unwilling or afraid to convict, and if witnesses can only give evidence at the risk of their lives, there is no reason why the wickedest and most noxious of mankind should enjoy absolute impunity. The insurrection which Mr. FORSTER regards as possible furnishes another reason for precautionary legislation. A civil war would be a much greater evil than the incarceration for a maximum period of eighteen months of a few desperate and unscrupulous adventurers. If it is true that, as Mr. DILLON asserts, half the priests in Ireland have joined the Land League, and that a Roman Catholic Archbishop is ready to place himself at its head, the conspiracy is only the more dangerous; but there is no reason to apprehend that either priests or prelates will commit in person the outrages which they are

supposed by their eulogist and professed confederate to approve. The identification of the hierarchy and the priesthood with the Land League would not tend to increase its popularity either in Ulster or in England. The Catholic clergy in France and in Germany would have little reason to thank their Irish colleagues for proving that their order, while it denounces revolution on the Continent, is ready for its own interest to join a revolutionary organization. To other threats of Mr. DILLON and of like-minded agitators it is only necessary to reply that the dangers which they indicate, if they are not imaginary, furnish additional reasons for the exercise of energy and vigilance. The friends of order and liberty may be well assured that the League has done or will do its worst without any alleged provocation from the Government or the law. It will derive no additional facilities for effecting its objects from the arrest of some of the assassins and reprobates who constitute its police.

The Ulster Liberals and the English Radical members who desire to make protection contingent on the production or promise of a sweeping Land Bill are, consciously or otherwise, effective allies of the Irish Irreconcilables. Almost all of them profess to believe that the Protection Bill is necessary, and indeed they could not vote for it on any other assumption. It is utterly unjustifiable to discountenance and delay relief to the oppressed classes in Ireland as a means of placing pressure on a Government which is supposed to sympathize only too strongly with their questionable doctrines. They ought to have no fear that the rights of property will be too nicely regarded. The Ulster tenants have taken advantage of the agitation of the Land League to demand a transfer of a portion of the landlords' property to themselves. Twenty-two thousand signatures were appended to a memorial in favour of their demand which Mr. FORSTER, with unnecessary zeal, declared that he received with pride and pleasure. Only a few weeks ago land projectors incessantly quoted a passage from the Report of the Devon Commission to the effect that the Ulster custom had produced in that province universal content, while the absence of the custom accounted for the misery and disorder of Munster and Connaught. It now appears that Ulster requires something more, as indeed most persons and classes require any advantage which they think that they can obtain. The Ulster farmers are too respectable to hough cattle or card dissentients from their opinions, but they hope to profit by the prevalence of outrages in Munster and Connaught to enforce their novel claims. The merchants and manufacturers of Belfast who, according to Lord DUFFERIN, have largely invested their savings in land in the Northern counties, will not escape from the baneful influence of the Land League. Purchasers of this class have within a few years bought land from Lord DUFFERIN himself to the value of 350,000*l.*, returning an interest of two or three per cent. They are now threatened with an arbitrary reduction of their modest incomes for the benefit of tenants who are in most instances perfectly solvent. The benefit to the occupiers themselves will be exhausted by the first transaction. They will be able to sell their interest at a price enhanced in proportion to the reduction of rent; and the interest of the increased purchase money will at once practically subject the incoming tenant to a rack rent determined by competition and contract. When the result is ascertained by experience the occupiers will

demand, perhaps with some justification of a further portion of the late Government. BRIGHT'S speech will shake any growing confidence in GLADSTONE'S moderation and justice.

Some occurrences which in other circumstances might excite indignation or alarm are perhaps not, on the whole, to be regretted. The contumacious Irish members have revived in full force the practice of obstruction, with the result of uniting against them the opinions and feelings of all parties, not excepting the extreme faction which has on other occasions done its best to assist them. They have shifted the issue from the expediency of protecting life and property in Ireland to the necessity of vindicating Parliamentary freedom of debate. They may perhaps succeed in permanently diminishing the rights of minorities, but they will achieve no further triumph. Successive experiments may perhaps be tried before the House of Commons ascertains the most effectual method of baffling the enemies of free discussion. The rules of the House, as of all other human societies, have been constructed on the assumption that the members of the body, although they may differ on the choice of methods, loyally desire to promote the objects of the institution. Against internal treason no provision has been made; but it is impossible to believe that Parliament will succumb to the dishonourable assault of a petty gang of conspirators. With a more plausible affectation of good faith they might probably have done more harm. The defeat of justice by the action of the Dublin jury is still less to be lamented. The traversers and their friends have clinched the demonstration that the ordinary process of law is inadequate to the necessities of the present situation. It was highly improbable that twelve jurors could be impanelled who neither sympathized with the Land League nor feared the consequences of doing their duty. It is creditable to some of the jurymen that they were inaccessible to the motives which influenced their colleagues. The danger of returning a verdict unpalatable to the rabble was not imaginary. One jurymen suspected of regard for his oath was threatened by a formidable mob, which perhaps acted on the information of another member of the same body who had publicly congratulated Mr. PARNELL, and who immediately afterwards solicited admission to the Land League. The very agitators must have been almost ashamed of the cynicism of their latest proselyte. A conviction would have thrown great difficulties in the way of the Government, as seeming to prove that the ordinary law was sufficient for its purpose. It would also have been inconvenient that some of the ringleaders of the Land League should have been prevented from taking part in the discussion of the Protection Bill and the Land Bill. The compulsory absence from the House of Commons of Mr. PARNELL and several of his followers would have been used, like the censure inflicted on Mr. BIGGAR, as an additional excuse for obstruction. The prosecution for conspiracy was, in the first instance, an ill-devised attempt to avoid the necessity of passing exceptional measures. At that time the Birmingham Ministers had succeeded in persuading or coercing the Cabinet into a practical acceptance of the proposition that force is no remedy for lawlessness. The indictment for conspiracy was so far not an act of force that it was preferred in conformity with the ordinary law. It is now evident to all the world that force, or, in other words, the suspension of the Habeas Corpus, is the only remedy. Mr. PARNELL and his friends would have done as much harm in prison as they will do in the House of Commons.

THE FALL OF GEOK TEPE.

THE capture of the Turcoman stronghold, if it be as complete as the Russian despatches announce (and there is no reason for disbelieving them), puts an end to perhaps the most gallant defence which has in recent times been made by a half-civilized, undisciplined, and badly-weaponed army against the regular troops of a civilized nation. From the time when General SKOBELEFF was appointed to his ungrateful command, it was evident that he meant business. He avoided the mistakes of his predecessors, LOMAKIN and LAZAREFF, with an astuteness equal to the decision with which he was already credited. He did not attempt to advance with an insufficient force; nor did he, on the other hand, waste time on the impossible project of getting fifty or a hundred thousand men across

a foodless and waterless desert. Starting from eight to twelve thousand good troops, he provided them amply with food and all appliances, and even more than amply with artillery. It was said that he had made up his mind not to attack Geok Tepe till he could bring a hundred *ouches* a few to bear; and, though this may be an exaggeration, the numbers of guns and mortars mentioned in the reports of the desperate fighting which preceded the fall of the place show that the Russian general had relied greatly on this important arm. Ten thousand disciplined troops, supplied with every necessary, and with scores of heavy guns, and making the most of the possession of engineering science, must be very badly led indeed if they cannot triumph against many times their number of irregular troops, badly armed and unprovided with artillery. If the latter remain on the defensive, the artillery pounds them into submission; if they attempt sorties, they are swept away and mowed down by the breechloader; while fortified parallels and redoubts break their advance, even if they be successful in a despairing rush. The Akhal Tekkés and their allies from Merv chose the bolder part. From the day when the Russians opened fire on their fort they threw themselves on the guns, the entrenchments, and the breechloading rifles with a vigour which successive defeats could not check, and which, according to one not improbable story, was only broken at last by the employment of mines on a great scale. Again and again they forced the Russian lines, carried redoubts, captured cannon, and inflicted heavy loss on their besiegers. But, in the end, the tremendous fire opposed to them, and the disciplined steadiness of Russian troops, assisted by the spade as well as the gun, obtained the success which, except for the possible intervention of a miracle or a blunder, was hardly doubtful from the first. If, as is said, the whole of the positions collectively known as Geok Tepe have been carried and the survivors of the garrison are in retreat, little but fitful opposition is likely to be offered to the Russians west of Merv.

The question—hitherto possessing only a languid speculative interest—how far the CZAR'S generals will be instructed or allowed to push their victory now becomes a pressing one. Some reports already have it that portions of the force under SKOBELEFF are in motion towards Sarakhs, the extreme north-eastern frontier city of Persia, close to Herat. These reports, however, may be set aside, because no Russian force could have got any distance in this direction without passing Derogez, where there is a competent European observer, who has been quite silent on any such movement. Other reports talk of vast forces under KAUFFMANN, concentrating on Charjui, with a view to co-operation with SKOBELEFF. This, too, is not worth much attention, for the selection of the Caspian routes for the reinforcements recently sent shows clearly that, as yet, no force of eighty or a hundred thousand men has the least chance of penetrating the trans-Oxian wilds. But there is no doubt that General SKOBELEFF'S present force can be reinforced *ad libitum* from the Caspian, and that his victory, if it be half as complete as it is reported to be, will open the way eastwards to him. It is not an unimportant thing to remember that a considerable force from Merv was actually engaged at Geok Tepe, for this fact may exercise no small influence on the attitude of the Merv Turcomans. They know General SKOBELEFF at first hand; they have had experience *quo turbine torqueat hastam*. It is even said that part of their contingent abandoned the struggle before the fall of Geok Tepe. Nor is any one save the ostriches of Radicalism ignorant of the ardent desire with which the eyes of Russian "forward" politicians are set on Merv. Against this is to be put the assertion that the two men who have, or ought to have, most credit with the CZAR in military matters, SKOBELEFF and LOMIS MELIKOFF, are of opinion that the Turcoman game is not worth the candle, and that when full satisfaction for the former defeat has been obtained, evacuation is the very best thing for all parties. We are even told that assurances have been given to England by Russia that there is no intention of occupying Geok Tepe, much less of pushing on to Merv. It is necessary, however, to remember—putting the debated, if not debatable, point of Russian desire to get hold of places of arms against India out of the question—the well-known orthodoxy of the KAUFFMANN school, and the equally well-known craving of Russia for subjugating warlike races who can then be made to fight her battles. Not ancient Rome

expressed a happier knack of doing this, and she has but too good cause for knowing the admirable quality of the Turcomans as raw material for soldiers. Men who undisciplined and half-trained will charge through the point blank fire of breech-loading rifles and breech-loading artillery are not to be had every day. Still less men who are already in the position of an advanced guard for offence or defence against the only possible serious enemy. When to this we add the fact that an occupation of Southern Turkestan would further rivet the hold which Russia already has on Persia, it must be obvious that the temptation to improve the results of SKOBLEFF'S daring and good dispositions must be very great indeed. Russia at least is not a Power *qui a cessé de prendre*.

The intelligence of the fall of Geok Tepe, and the uncertainty prevailing as to the next step which the Russians may take, cannot but intensify the anxiety which prevails on the question of the abandonment of Candahar. On this question, more perhaps than on any other, the Government have displayed a mixture of secretiveness and indifference to expert opinion which, if it had been displayed by their predecessors, would have been made the theme of denunciations on a hundred platforms. No valid arguments have yet been offered for the abandonment of the glacis of India. It is understood that the balance of professional opinion is immensely in favour of its retention. The singular manner in which the Government treated the question of Lord NAPIER'S memorandum in the House of Lords the other night seems to show that their conclusion, however it has been arrived at, has not been assisted or retarded by any reference to professional judgment. Recent events, indeed, have made it impossible that that judgment should not be against them. The events of the latter part of the summer of 1880 proved two things:—first, that Candahar can be very easily reached from the north; secondly, that it is a sufficient barrier to a further advance southwards. No argument can get over this plain and simple lesson of events, and, to do the Government justice, they have not attempted any. Their reticence long seemed to demand from persons who like to observe old-fashioned rules of courtesy an abstinence from comment on an undecided case. The case seems to be decided now, and fresh evidence against the wisdom of the decision continues to accumulate. The question of the victories of the Russians on the frontier of Northern Afghanistan cannot be left out of consideration in discussing the wisdom of retaining a hold on Southern Afghanistan. We can only hope that the final decision to abandon Candahar had nothing to do with the reported Russian engagement to retire from Geok Tepe, a thing which is at least not impossible. The value of the assurances obtained by Liberal statesmen from Russia has been, one would have thought, sufficiently demonstrated; indeed, that value is now what may be called an irrational quantity. For when Liberals themselves take pains, as they did two or three years ago, to argue that the chance of a quarrel with the other party to a contract *ipso facto* absolves the contractor from his bargain, it would be idle chivalry on the part of the Czar's advisers not to take them at their word. According to reason and precedent, an agreement that we should retire from Candahar, and the Russians from the country of the Akhal Tékkés, would mean that we should retire and that the Russians should not. This may be in any case the result; but it would be at least gratifying to national vanity if it were attained without the conclusion of a rather discreditable and perfectly futile bargain.

TURKEY AND GREECE.

THE most hopeful circumstance connected with the last Turkish proposal of negotiation is the assent which it has received from the European Governments. The Cabinets seem to have some reason which is not obvious to private observers for relying on the good faith of the Porte. It is true that, according to the ordinary practice of diplomacy, an offer of negotiation would imply a disposition to compromise. In the Note of the 3rd of October the Turkish Government had offered a cession of territory which was unanimously rejected by the Powers as insufficient. Another declaration contained in the Note was immediately afterwards retracted by the surrender of Daloigno. The French proposal of arbitration, which was the next step in the transaction, ultimately fell through after prolonged discussion, unless, indeed, it may be virtu-

ally revived in the form of a *Requiescence* of Ambassadors at Constantinople. It was always understood that arbitration was merely an ostensible title for a settlement of the main question to be determined beforehand. A negotiation for the arrangement of the frontier will have precisely the same object, and it will, by the present method, be neither more nor less difficult to arrive at a satisfactory conclusion. It may be assumed that the Governments have received assurances that the Porte is now ready to advance on its former concessions. On the other hand, it seems to be understood that the demand for the surrender of Janina and Metzovo is no longer to be pressed. It is not yet known whether Greece has demanded admission to the Conference. The Porte has hitherto contended that it has no obligation to Greece, although it admits a responsibility, of which the extent is undefined, to the Powers which took part in the Congress of Berlin; but there is no reason to suppose that the technical objection will be either seriously urged or admitted by the representatives of the Governments. The principal obstacle to the participation of Greece in the negotiation will be found rather at Athens than at Constantinople. The Greek Government has to the present time affected to consider the recommendation of the Conference of Berlin as final, and attendance at a Conference would be an admission that the question was still open to discussion.

If the Porte could be trusted to act openly and to consult its own true interest, it would now have an opportunity of putting itself in the right against a litigious adversary. The cession of the greater part of the territory in dispute, on the sole condition that the Greek Government should acknowledge that its claims were satisfied, would involve no painful sacrifice if the offer were accepted, and it would deprive the Greeks of all hope of foreign aid if they obstinately persisted in their project of offensive war. It is asserted, with much probability, that the SULTAN and the advisers whom he trusts desire, as the most advantageous solution of the difficulty, a single-handed war with Greece. It is highly probable that the result of such a struggle would be the retention by Turkey of the whole of the territory in dispute; but it may be confidently affirmed that it would not be for the interest of the Porte to remain in possession of provinces which have, on grounds of expediency, been more or less formally adjudicated by the Great Powers of Europe to belong to Greece. If, nevertheless, the Plénipotentiaires at Constantinople are forced to attribute a rupture exclusively to the pertinacity of the Greek Government, the Powers will necessarily remain neutral in the contest. Notwithstanding the general repugnance to war, it is not certain that, if the Porte were to precipitate a quarrel, Greece might not receive from some of them aid and countenance. There have been several modifications of Eastern policy within the last six months, and there is no reason to suppose that the possibilities of danger are exhausted. The Russian Government, which has after some hesitation concurred in the Turkish project of a new Conference, might possibly not be disappointed at the failure of negotiation by the fault of the Porte, although it is perhaps not at present disposed to promote or permit disturbances in Bulgaria or Macedonia.

The Greek Government has not ostensibly relaxed its preparations for war; and, with or without its connivance, it is urged forward by popular agitation. The Ministers, and even the Chamber, are threatened with the displeasure of the nation if they listen to proposals of compromise; but the Government is well aware that it would be held more strictly responsible for defeat. Warlike journalists and demagogues only know at second-hand the strong diplomatic pressure which is, with no unfriendly purpose, applied to the Government. The advocates of war still affect to believe that arbitrators who repudiate both the authority and the judgment ascribed to them have given a conclusive award in favour of Greece. There can be little doubt that, as regards some of the Powers, the Greeks are historically in the right. Lord GRANVILLE, in one of his despatches on the Conference, proposed that it should be announced to the litigants "*avec l'invitation à chacun des Puissances intéressées d'avoir à s'y conformer*." The French word *invitation* has a more peremptory meaning than the similar English word. If the contention of Greece is well founded, the controversy is frivolous and irrelevant to the material issue. States are not in the habit of engaging in unequal wars merely because they have a good or a plausible cause of quarrel. In the present instance Greece has a much better right to reproach its backward friends

and patrons than to attack Turkey, on which it has no legal claim. The moral right of Greece to liberate and govern the Greek population of Thessaly might justify an appeal to arms if it was likely to be successful. It is not worth while to inquire into the right of a man or a nation to commit an act of ruinous folly. If it were admitted that all parties were to blame, the fact remains that Turkey, especially on the defensive, is more than a match for Greece. The Berlin Congress and the Berlin Conference encouraged unfounded expectations; and Lord BEACONSFIELD himself may possibly have believed that Janina would be surrendered by Turkey when he expatiated on the territorial aggrandizement of Greece; but either the assembled Plenipotentiaries and the late Prime Minister were misunderstood, or they afterwards changed their minds. The Greeks have still more reason to resent the encouragement which they received from Lord ROSEBURY'S Committee, and Mr. CHAMBERLAIN'S unauthorized assurance that, if they went to war, they would not stand alone. That they have deceived themselves and been deceived by others is no reason for running their heads against a wall. In one despatch the Greek Minister gratuitously puts himself in the wrong. It is, he says, the first time that the Powers have recognized the right of Turkey to any dominion in Europe. No good title, he proceeds to argue, can be derived from four hundred years of usurpation. The Porte would be perfectly justified in treating Mr. COMMOUDOUROS'S outrageous paradox as an admission that Greece would, even after an amicable settlement, be restrained by no regard for good faith or international law. Not to go farther back, Mr. COMMOUDOUROS has surely heard of the Treaty of Berlin, and of the territory which it guaranteed to the SULTAN.

There is probably no foundation for the report that the Turkish Government is disposed to enlarge its concessions in Thessaly on condition of a modification of the Greek demands with reference to Epirus. Arrangements of this kind would be objectionable in principle, because there is no reason why one district containing a Greek population should remain under Turkish rule that another might be liberated. It may be doubted whether any Turkish negotiator has voluntarily offered even contingently to surrender any portion of territory which had not been the subject of a claim. In discussing the line of the North-Western frontier the Porte may perhaps not be a free agent. The population in those parts is wholly or partly Albanian, and it may perhaps interfere in the disposal of its territory. The Albanian League was originally formed with the sanction of the SULTAN, as an auxiliary force, and, at the same time, as a pretext for rejecting troublesome demands. It was convenient to answer remonstrances on delay in performing the stipulations of the Berlin Treaty by the suggestion that the inhabitants of districts required to be ceded would not acquiesce in the transfer of their allegiance, and could not properly be coerced. The half-civilized Albanians seem not to have appreciated the motives which induced the Porte to promote their organization. They seriously disapproved of the surrender of territory to Montenegro, and they were perhaps surprised when DERVISH PASHA compelled them to obey the commands of the SULTAN. The League has not been dissolved; and the tribes now claim an independence which it may perhaps be difficult to withhold. They even threaten an alliance with Greece if their demands are refused, and it is possible that their overtures may partially explain the warlike attitude of the Greek Government; yet it would be dangerous to trust to their support, because the Turkish Government could at any time recover the allegiance of the Albanians by granting their demands. If Albania achieves local independence, it will be a troublesome neighbour to the new possessors of the neighbouring districts of Epirus. It is probable that the Greeks count on the aid of other allies in the Balkan peninsula; but they would not be well advised in assisting to destroy what remains of the sovereignty of the SULTAN. They are more likely to extend their influence in the decaying Turkish Empire than in the Slavonic principalities. In the present crisis an impartial judge between the litigants would give the same opinion which would be expressed by a prudent partisan of Greece. It is desirable to gain as much as possible in negotiation, and it can in no case be expedient to incur the risk of war. The clamour of the mob ought not to determine the policy of the nation.

THE DIGNITY OF THE BENCH.

THE meeting of the Bar called to discuss the proposed abolition of the two chiefships of the Common Law Division must have disappointed most of those who attended it, and all who only read its proceedings. If the Bar met for such a purpose and on such an occasion, it was to be presumed that it met because in a matter which interested it, and as to the merits of which it had special knowledge, it could urge something that was of real moment and that ought to exercise a powerful influence over public opinion. The Government has resolved on the abolition, a large majority of the judges has approved of it, the legal heads of both political parties think that it will conduce to the public benefit. Under these circumstances it was scarcely worth while for the Bar to come forward unless it had something very precise and pointed to say against the proposal, some new and telling arguments to put forward which might at the last moment convince the public and Parliament that the Government and the majority of the Judges, and Lord SELBORNE and Lord CAIRNS, were all making a serious mistake. But when the meeting got to work, it appeared that the Bar had no opinions to offer or arguments to put forward. All it could manage was a desultory chat. Mr. FORSYTH doubted very much whether some men would give up lucrative practice and a seat in Parliament for a puisne judgeship. Except to keep himself in harmony with the sentiment of mild perplexity which pervaded the meeting, Mr. FORSYTH need not have kept himself within the modest limits of a doubt on the point. Experience has long removed any doubt. Some such men will take puisne judgeships, and others will not. The next speaker had his own little question to put. What would be the use of Attorney-Generals if such offences were to be abolished? This was the kind of argument which Mr. FORSYTH, when forecasting the decision of the meeting, thought would make Parliament think once and twice, and even thrice, before it supported the Government. Even Mr. BIGGAR would hardly like to oppose the Ministry on the broad basis that the only possible use of Attorney-Generals was to get Chief Justiceships. Then came Sir GEORGE BOWYER, and his contribution was a delicate disquisition on the *onus probandi*. He thought that, if enough trouble was taken to work out the problem, it would appear that the *onus probandi* lay on those who supported the abolition. He spoke as if he had got a special curse in his pocket, which, if the meeting approved so awful a proceeding, he could pull out, and with which he could blight and blast every one. The meeting seemed to think the *onus probandi* had better stay where it was, and rambled off into general statements of incompetence to form any opinion at all. Speaker after speaker said that he did not know whether the abolition would do good or would do harm; but, as a gentleman and a man of some learning and much honour, he would not shrink from saying that, if he could be made to understand that the change would do good, he would support it; and if he could be made to understand that it would do harm, he would oppose it. This was the final expression of the opinion of the Bar in a matter which was supposed to be especially within its own province. After this meeting, the contest—if there can be said to have been a contest—may be treated as at an end. The abolition of the chiefships has been decided on, and will be carried out.

It would be scarcely worth while to recur to the proposed change which the Bar found certain beyond the possibility of all but the slightest doubt, and left certain beyond the possibility of all doubts whatever, had it not been that a much more formidable opponent of the change than any who spoke at the meeting has lately come forward. Mr. Justice STEPHEN has published his views in the *Nineteenth Century* on the bad effects of this and other recent legal changes. He does not, indeed, set any great importance on the retention or abolition of the two chiefships. What he objects to is their being abolished in pursuance of a general scheme of reform which he thinks bad, and thinks bad for the reason that it tends to lower the dignity of the Bench. Whatever Mr. Justice STEPHEN writes is sure to be clear; it is sure to be vigorous; it is sure to be free from such trivialities as the final cause of Attorney-Generals and the awful problem of the *onus probandi*. And when a judge utters a warning against so serious a

national evil as the lowering of the Bench, all that he says deserves attentive consideration. Nor can most people honestly say that what Mr. Justice STEPHEN urges is not new to them, or that they have heard and disposed of it before they read his article. The basis of his argument is that the highest qualities of a judge are called forth, not when he decides points of law, but when he presides over a jury. This is the task which gives him public standing and dignity. It is this that makes men admire, and reverence, and bow to him. Questions of law and questions of procedure are all settled in the background. It is only when he presides over a jury trial that a judge walks the stage with the recognized importance of playing a first-rate part. By the dignity of the Bench Mr. Justice STEPHEN means the dignity of presiding over juries; and he objects to the abolition of the chiefships because it tends to impair the dignity which presiding over jury trials alone can give. It is Attorney-Generals to whom these chiefships ordinarily fall; and that there should be such offices, and that there should be Attorney-Generals to take them, sustains the dignity of the Bench in two ways. It supplies a contingent of judges specially fitted to preside over juries, as Attorney-Generals have been in the habit for years of taking part in jury proceedings, and are generally not mere lawyers, but men of the world, accustomed to the bustle of Parliament, and fitted to play an imposing part in public. Then, again, the mere fact that places of the highest honour are conferred on judges of the first instance tends to maintain the dignity of the jury-presiding judges, and to make it clear that there is nothing in itself more dignified in hearing appeals than in presiding over trials. Really the balance of dignity ought to be the other way, and if the intrinsic merit of the two performances had alone to be considered, a judge ought properly to begin as a Lord Justice, and if he kept his health and did well, he ought to be promoted to a puisne judgeship.

There is, however, in the opinion of Mr. Justice STEPHEN, something better than the retention of the chiefships as a counterpoise to the Lords Justices, and that is to do away with the Lords Justices altogether. All judges below the House of Lords might be on the same level, and then, as there would be no invidious comparisons, the dignity of all would be increased. They could easily provide among themselves a subordinate Court of Appeal on which all would sit in rotation. And not only would this allow all judges to attain the only true eminence to which a judge can legitimately aspire, that of presiding with dignity over a jury trial, but it would furnish the only possible means of reconciling the jury system with a system of immediate appeal. For, if a new trial was moved for, the judge who had presided at the original trial could always be put on the rota of appeal which heard the motion, and thus he would be recognized as being as high as any other judge, and would not fulfil the humble office of a mere commissioner reporting to his superiors in the Appeal Court what he had endeavoured to do to the best of his power in some remote country place. There are many subsidiary observations, full of good sense and excellent in themselves, on the glaring defects in our present appellate system, but this is the main line of Mr. Justice STEPHEN's arguments. It all comes to this. The highest eminence of a judge is to preside over juries, and if this eminence is not distinctly recognized as the highest, at any rate let nothing be put above it. The majority of the judges do not agree with Mr. Justice STEPHEN, and the most convenient mode of criticizing a judge who differs from his brethren is to imagine the reasons which may have weighed with the majority. They may have observed that, although to preside over trials demands very high qualities, many men of different standing and power seem to do the work very fairly well. Few judges are appointed because they are great in their knowledge of and power over juries. They are mostly appointed because they have done leading business well, or are known as good lawyers. Even if they are as unaccustomed to jury trials as Chancery barristers used to be, they appear to learn very quickly how to get on with juries. In these days the Chancery Courts are more and more occupied with the *viva voce* examination of witnesses, and it may now be said that all leading barristers are being trained for jury work. No doubt presiding over juries is not only a dignified, but an instructive, office; and it is because of this that the judges of appeal, as well as the judges of the first instance, are made

to go Circuit. Of course every judge who sits as a judge of first instance is liable to be overruled on appeal; but there does not seem any reason why a judge who has tried a case with a jury should be more humiliated because he is overruled than a judge who has given a decision after hearing the oral evidence of witnesses. In fact, in so far as his work has been lightened by a portion of the burden having been cast on the jury, he ought in reason to feel less humiliated. Probably much of this supposed humiliation is a mere question of language. A judge who makes a mistake in law is said to misdirect a jury, and this seems as if he had done more than make a mistake in law, and had somehow not been quite up to his business. Every judge who makes a mistake misdirects somebody. If there is no jury, he misdirects himself; and the process is exactly the same, and involves no more reproach in one case than the other. In answer to the suggestion that all judges should be on an equality, and provide a Court of Appeal by rotation, the majority of the judges might have paid attention to the fact that the suitors would not like it. If they pay for an appeal, they want to have a strong Court of Appeal. Lords Justices BRAMWELL, BRETT, and LUSH have all been puisne judges, and they are now in the Appeal Court because they are the three judges whom, under Mr. Justice STEPHEN's system, suitors would wish to see on the rota when their case came on. It may also have occurred to the majority of judges to doubt whether the dignity and fame of judges is exclusively connected in public estimation with presiding over jury trials. If any one was asked who were the most eminent men of the present day both as advocates and judges, he would unhesitatingly reply, Lord CAIRNS and Lord SELBORNE, neither of whom probably has ever sat in a jury case. Such men give dignity to the Bench, and so do strong judges of appeal, and judges peculiarly fitted to preside over jury trials. All work, each in his own sphere, towards maintaining their common dignity, and so long as the right men are appointed, the dignity of the Bench may be expected to endure without much anxiety being expended on it.

SOUTH AFRICA.

IT is possible that an important or decisive action may by this time have been fought on the border of the Transvaal. As soon as the news of the revolt was received, Lord KIMBERLEY directed Sir G. P. COLLY to transfer to a deputy the administration of Natal, and to assume in person the political and military conduct of affairs in the Transvaal. Sir G. COLLY has thus far executed the order with remarkable promptitude. He thought it better to advance at once with the troops at his disposal than to wait for the reinforcements which have since arrived at Durban. He is strong in artillery, of which the insurgents have no provision; but his mounted infantry may perhaps scarcely be as efficient for purposes of rapid movement as the Boers who pass their lives on horseback. When the troops which have been disembarked at Durban arrive at the front, the inequality will be in some degree removed. It is satisfactory to learn from the published despatches that, on the first rising of the Boers, Sir G. COLLY thought that the force at his disposal was sufficient for the Transvaal, though a regiment would be required to replace the troops which must be withdrawn from Natal. The disaster which afterwards befel a part of the 94th Regiment on its march to Pretoria may have qualified his judgment; and there is reason to fear that the garrison of Leydenburg, forming part of the same regiment, has since been compelled to surrender. Civilians, and even military men, at a distance from the scene of action can form no competent judgment of the prudence of Sir G. COLLY's vigorous movement. Until the result is known, it is reasonable to repose confidence in the judgment of a skilful and experienced soldier, who has taken all the circumstances into consideration. The declarations of the Government in the debate provoked by Mr. RYLANDS are already known in the Transvaal, and are said to have produced a good effect. The small minority which voted for Mr. RYLANDS's motion would have greatly aggravated the danger if it had induced the Government to exhibit a tendency to waver. It is highly necessary to reassure loyal subjects and to convince the rebels that they must choose between submission and a resistance which is ultimately hopeless. At the beginning of the insurrection the leaders seem, in their ignorance of

political affairs, to have supposed that they could throw off the sovereignty of England without resort to actual war. Any illusion of the kind is now effectually dispelled. It is useless to conjecture whether the revolt was encouraged by Mr. GLADSTONE'S Midlothian repudiation of the policy of the late Government. He has now repudiated in the ordinary sense of the word the repudiation which it seems was intended only to express regret and disapproval. It is an equally unprofitable inquiry whether the progress and impunity of the Land League encouraged another body of disaffected agitators. The absurd report that a subordinate member of the Government has expressed treasonable sympathy with the rebellion may be summarily disregarded.

In a despatch of last November Sir OWEN LANTON opportunely reproduced the language in which the late President of the South African Republic explained and excused the annexation. The measure was, as the result has shown, detrimental to the interests of England; but it was honestly and on probable grounds intended for the benefit of the Transvaal. If Sir OWEN LANTON may be trusted, the great majority of the population continued to the eve of the insurrection to approve the policy which in the first instance received the unanimous, though tacit, sanction of the whole community. "Nearly every man I have conversed with has told me that the old form of Government was not only contemptible, but a source of danger, which he was glad had passed away; but still the same man will afterwards attend one of these mass meetings simply through the absence of all power of self-assertion and the lack of political self-dependence which is the outcome of an isolated life." At that time Sir OWEN LANTON thought that the leaders had no intention of bringing on open revolt; but he considered it necessary that the Government should take active measures to suppress the agitation. The methods of sedition vary but little in different parts of the Empire. In one case a party of Boers went to the Landroost, and informed him that they would not pay their taxes. Shortly afterwards, one of them returned and paid up all his dues, stipulating that the fact should not be made known. It is well known that the decrees of the Irish Land League have in numerous cases been similarly evaded. Mr. BURGERS illustrated in the speeches which he delivered immediately before the annexation the condition from which the Transvaal has been relieved at the expense of England. He asked the Volksraad whether the English could allow anarchy and rebellion to prevail on their borders. At that time Kaffir chiefs were in possession of farms from which they had with impunity expelled the Boer occupiers. Mr. BURGERS ridiculed the idea, which indeed had not been seriously entertained, of fighting for independence. "Let them make the best of the situation, and get the best terms they possibly could. Let them agree to join hands to those of their brethren in the South, and then from the Cape to Zambesi there would be one great people." Relying on such official statements, and supported by a force of twenty or thirty men, Sir THEOPHILUS SHEPSTONE proclaimed, without serious protest, the sovereignty of the QUEEN. It is admitted that, as an English officer, he exercised unsound discretion; but the benefits which he offered to the people of the Transvaal have been in great measure conferred, while the delay of establishing a representative Government is wholly caused by the obstinacy of the Boers.

For the first time since the settlement of the country there has been an efficient Government. The revenues have been applied to purposes of public utility, and justice has been regularly administered. At an enormous cost of English money and life the people of the Transvaal have been secured against the imminent hostility of native chiefs. The annexation was effected immediately after the defeat of the Boers by SECOCOENI, and at a time when the great power of CETEWATO was apparently about to be employed against the Republic. Since the annexation CETEWATO has been defeated and dethroned, his army has been disbanded, and his territory is distributed among a number of petty chiefs. SECOCOENI also has been conquered; and it is because they have been relieved by English arms from the danger of native hostility that the Boers are at leisure to organize a revolt. The morality of the Zulu war has never been established to the satisfaction of Englishmen; but the people of the Transvaal are estopped from objecting to a policy which relieved them from a formidable danger. It is difficult to suppress a feeling of regret that they had not the opportunity of encountering the Zulu

army without English aid. One of the causes of the war was the strained interpretation which, in the interest of the Boers, Sir BARTLE FRANKS gave to a territorial award which had been given against them in favour of the Zulu King. There is nevertheless reason to believe that some of the Transvaal leaders attempted to intrigue against English interests with both their hereditary enemies. Having secured the protection which they required, they would gladly have embarrassed by native disturbances the Government which had secured their peace and safety. It is said that during the present insurrection the Boers have in vain attempted to enlist in their cause the Swazis, who were formerly their allies, and some of the petty Zulu chiefs. If the accusation is true, they will have thoroughly alienated the sympathy of their former well-wishers at the Cape. Even the prejudiced and violent leaders of the revolt will scarcely venture to ally themselves with the Basutos.

The disfavour with which Mr. RYLANDS'S motion was received will probably prevent the renewal of ill-timed discussions in Parliament. The political issue is suspended during the continuance of hostilities. Any anticipation of the results of the campaign which is now beginning would be premature. It is only known that Sir G. COLLIER has assumed the offensive, and that he will soon be joined by considerable reinforcements. The beleaguered garrisons are said to have sufficient supplies, and they have little to fear from the assaults of an enemy who has no artillery, while that of Pretoria, at any rate, has been able to make a most successful sortie. As in all thinly-peopled countries, the large spaces to be traversed form the principal difficulty of an invader. The little towns or villages which are scattered over the country are for the most part loyal to the English Government. If the Boers suffer any early and considerable defeat, some of their number will probably declare themselves on the winning side. If, on the other hand, the English army meets with reverses, they must be redeemed, whatever may be the cost of the effort. Discussion as to the future settlement of the province is at present likely to do nothing but mischief. It may be hoped that no offensive Minister will think it necessary to make any more half promises to irresponsible philanthropists, native or foreign. It is highly probable that political reasons may both justify and require the permanent assertion of a sovereignty which seems at first sight unprofitable. It is a duty to protect the English and loyal Dutch of the Transvaal, and to secure the natives from oppression. It may also be necessary to keep alive a title which might hereafter be disregarded, if it had become obsolete, by some rival Power. It is possible that an ambitious Government might acquire Delagoa Bay, as a means of access to a large territory in the interior. The sympathy which some foreign journals express for the Boers is not incompatible with projects of aggrandisement. It would be undesirable to sacrifice one of the few advantages connected with the possession of South Africa, which consists in the absence of European neighbours.

FRANCE.

ENGLISH politicians have occasionally been accused of coquetting with the licensed victuallers, but none of them have ever identified themselves so completely with the publicans as M. GAMBETTA has lately thought fit to identify himself with the wineshopkeepers of Paris. The President of the Chamber of Deputies spent the eve of his re-election to the chair in taking counsel with these injured tradesmen how to temper the cruel severity of the existing law against adulteration. This is a fresh and striking instance of the subordination in which the French consumer stands to the French producer. It might have been expected that M. GAMBETTA, sitting for a working-class quarter of Paris, and leading a party in which the working-class element is exceedingly strong, would have been more anxious to secure sound wine for his constituents than to make it easier for the wineshopkeepers to dispose of the compounds which they too often substitute for wine. The two interests cannot both be consulted. The man who drinks wine and the man who adulterates wine are natural enemies. The one looks to the law for protection; the other thinks how to evade the law until he is able to deprive it of its sting. At one part of his speech M. GAMBETTA did seem to have the consumer in view. The wineshopkeepers, he said, are a very important class

in a society which contains large masses of workmen. "Labour creates thirst." The natural conclusion from this maxim would seem to be that the class which labours most, and consequently is most thirsty, is also the class which most needs the help of the law to ensure that the liquor with which it quenches its thirst should be genuine and, at all events, as wholesome as it is in its nature to be. But this is not M. GAMBETTA's conclusion. The inference he draws from the relation existing between labour and thirst is that it is the man who adulterates wine, not the man who drinks it, that needs protection. No doubt M. GAMBETTA admits that there are some forms of adulteration which deserve severe punishment. The cheers which followed this assertion on his part proved, what might have been guessed beforehand, that none of the wineshopkeepers who listened to him were prepared to deny the position when thus nakedly stated. In the lowest depths of adulteration there is probably a lower depth still; the man who puts strychnine into beer would be shocked at the suggestion that he should put in arsenic. The best test of the efficiency of a law against adulteration is the fact that those against whom it is directed are eager to get it made milder. The French law against the adulteration of wine seems to fulfil this condition. The wineshopkeeper who is convicted of selling for wine a compound which is not wine has his condemnation posted outside his shop and is deprived of his civil rights. This last penalty may very possibly be too severe, inasmuch as it leaves no place for repentance. But the former is exactly what the case demands. The best punishment that can possibly be inflicted for adulteration is loss of custom. Gain is the end for which adulteration is practised, and if its detection makes further gain impossible, or greatly reduces it, the adaptation of the punishment to the offence seems complete. M. GAMBETTA is shocked at the thought that a man may be ruined by merely adding something to the wine he sells. It does not seem to occur to him that the man in question might have avoided ruin by the simple expedient of being honest. When a dealer once understands what the law with regard to adulteration is, he deserves no pity if he comes within its grasp. If he had only chosen to be honest and sell his goods under true names, no harm would have come to him. Apparently M. GAMBETTA is of opinion that the workmen of Belleville will feel so much sympathy with men who break the law and suffer for it, that they will forget that it is they themselves who are injured by the breach of the law. Even under a Republican Government their hatred for the law is stronger than their love for honest liquor.

The PRESIDENT of the CHAMBER adopted a more dignified tone when returning thanks next day for his re-election. To English ideas his address to the Chamber would have been more in place if he had been either President of the Republic or Prime Minister. But this particular anomaly is one with which the French people have long been familiar, and, if they do not mind it, it would be idle in foreigners to criticize it. Englishmen would think it strange if the Speaker began the last Session of a Parliament by praising the House of Commons for what they had already done, and enumerating the Bills which it yet remained for them to pass. But then they would have thought it equally strange if Mr. GLADSTONE had shown his appreciation of his victory at the elections by taking Mr. BRAND's place. The whole situation is so anomalous that it is impossible to judge it by any English standard. It is of more importance to note that the assumption of authority on M. GAMBETTA's part was more marked than on any previous occasion, and thus entirely bears out the universal belief that the close of the present session will mark the term of his quasi-retirement from political life. In one way or another, it seems to be understood that, as soon as he is satisfied that the electors have returned him as obedient a Chamber as there is any chance of his getting, he will relieve M. FERRY of his post, and become in name what even during this present Parliament he has been in fact. It is satisfactory to find that M. GAMBETTA's tone grows milder under the sense of approaching responsibility. He complimented the Chamber on having spent its time to so much purpose, but he made no open reference to the ecclesiastical quarrels with which, under his influence, it has of late been so much occupied. Whether we may infer from this that M. GAMBETTA thinks the conflict has already gone on long enough it is hard to say, but it would not be surprising if the recent victory of the

Government at the municipal elections had brought about some such change. If it has been shown that the mass of the electors have no tears to spare for the dispersion of the religious orders, it has also been proved that the influence of the Irreconcilables, even in Paris, is very much less than was anticipated. M. GAMBETTA may consequently feel that it is no longer necessary to bid for their support.

The Republic owes to these same elections the adhesion of a somewhat conspicuous convert. M. DUGUÉ DE LA FAUCONNERIE has resigned his seat, on the ground that, having been elected in 1877 as a Bonapartist, he has now ceased to be one. The letter in which he explains this conversion is marked by much good sense. The writer has at length satisfied himself that France is Republican, and that the disasters which have been expected to follow from that fact are merely imaginary. When the elections of 1876 returned a Republican majority, it seemed just possible that the result was due to surprise or misconception. But when the elections of 1877, conducted as they were under conditions extraordinarily favourable to the Conservative cause, gave the same answer, it was no longer possible to doubt that France wished the Republic to be given a fair trial. What was not then so certain was the issue of that trial. It might be that the definitive establishment of the Republic would lead to confusion and disorder; and the election of the next President seemed a most natural occasion for this result to manifest itself. But, when M. GRÉVY succeeded Marshal MACMAHON in the most ordinary way imaginable, and when, finally, the municipal elections made it evident that Republican ideas have gained the command even of those local bodies which have been hitherto the stronghold of the reactionary party, M. DUGUÉ DE LA FAUCONNERIE could no longer resist the combined testimony of all these events. There is not now, he thinks, any middle term between the Republic and the traditional monarchy; and, as he cannot accept the traditional monarchy, he has made up his mind to become a Republican. He does not blame Bonapartists who take the opposite course, and seek to reconcile themselves with the Royalists; but he thinks that it is no longer possible to halt midway between the two. Bonapartism as a creed professing to find a substitute for Republicanism has ceased in his eyes to have any meaning. All that those who have till now held it have to determine is in what direction they shall turn their departing feet. M. DUGUÉ DE LA FAUCONNERIE's view of the future of Bonapartism, properly so called, seems to be strictly true. It is another question what chances there may be for the democratic section of the party after they have frankly reconciled themselves with the Republic.

THE TAKING OF LIMA.

THE successes of Chili have been so great that the war seems virtually at an end. After the battle of Chorillos, in which the Peruvians are said to have lost 7,000 men and 70 guns, the Chilians advanced towards the capital and found that they had still another battle to fight. The President of Peru, PIEROLA, with an army of 25,000 men, was posted at Miraflores to make a last stand. As the Chilian army, which had landed with under 26,000 men, had already fought two battles and are said to have suffered heavily in the battle of Chorillos, the Peruvians at Miraflores must have had a numerical superiority. But the Chilian troops were of a much better quality, were flushed with victory, and had, it can scarcely be doubted, a much more formidable artillery, after the loss by the Peruvians of their guns at Chorillos. At Miraflores the Peruvians seem to have fought well, for they both suffered and inflicted heavy losses. Throughout the war there has been much hard fighting on both sides, and if the Chilians have won, it is partly because they were stronger in physique, better led, and better disciplined, but partly also because they have had the more powerful artillery. After their final victory, the Chilians entered Lima unopposed, and found that the Peruvian PRESIDENT had fled, apparently as a solitary fugitive, so that he has neither the means nor the wish to continue the war outside. A day or two after Lima was thus quietly taken, the fortress of Callao was surrendered, without any attempt having been made to defend it. The Peruvians have accepted the blow that fate has dealt them, and have recognized that a further struggle would be use-

is not much doubt that proposals of this kind will from time to time be made; but, however anxious a Minister, and especially a Minister not in the Cabinet, may be to contribute his share to the Statute Book, his success in doing so will be largely determined by the extent to which the public have been prepared for his measures. Every year the throng of Bills becomes greater and the available time for their discussion less. Private members have long ceased to have anything more than an occasional chance of carrying a measure through, and even Ministerial proposals have now to sustain a good deal of mutual jostling. No one Minister can look forward with any certainty to bringing his proposals safely out of the crush unless he is able to prove that people out of doors are expecting their introduction with evident interest. In this way, it may be hoped that Mr. FAWCETT will find his pamphlet really useful. It will help to set the public thinking what the Post Office now does and what it can be made to do. When they are once in this mood they will be very much more likely to give Mr. FAWCETT that kindly support in developing the system which will enable his proposals to survive the struggle for Parliamentary existence which is so often fatal to useful but unpretending legislation.

The success of Mr. FAWCETT's last experiment, the provision for deposits of one shilling by means of forms to which twelve penny stamps have gradually been affixed, shows that the difficulty which probably first suggests itself in connexion with the process of saving has no existence. No one seems to be really deterred from saving by the fact that he has very little to save, or that, when saved, it will bring him a very small amount of interest. To put by a penny at a time, and to look forward to the filling of the first form with postage-stamps as a goal to be slowly and painfully reached, implies a degree of poverty which would seem at first sight to make thrift impossible. It must be a long time before the sum thus put by can bring in any interest, inasmuch as twenty of these forms must be deposited with the Post Office authorities before the minimum at which interest begins is reached. Yet the experiment has proved that there are a large number of persons who are eager to lay by money, even under these disadvantages. Of course to persons thus painfully storing up coppers an interest which would seem unimportant to larger investors will have a real attraction. Whether interest begins to be credited when a pound has been accumulated, or whether this point is reached as soon as there are ten shillings in the bank, may seem a trifle. But to investors of the class whom Mr. FAWCETT has now succeeded in touching even threepence is not a sum to be despised. Supposing that a woman or a child is able to send in one of these forms each month, the selection of the sovereign or the half-sovereign as the point at which interest is calculated will determine whether it begins to be paid at the end of the first or not till far on in the second year of saving. At the other end of the Post Office scale comes the class which buys Consols, and this experiment also has already proved a thorough success. There seemed no very obvious reason why people who could already deposit their savings at $2\frac{1}{2}$ per cent. interest in the Post Office Savings Bank should prefer to invest them in a security where the convenience of withdrawal was less, and the interest paid only very slightly higher. Perhaps it is the very absence of this convenience of withdrawal that makes the new process popular. Money lying in the Savings Bank may suggest the idea of removal too plainly, whereas money invested in Consols may be regarded as more completely raised beyond the vicissitudes of human things. It will be interesting hereafter to note, by a comparison between the purchases and sales, whether money laid out in the purchase of Consols is regarded as a more permanent investment than money deposited in the Savings Bank. If it should prove to be so considered, it will constitute a strong argument in favour of reducing the limit below which investments in Consols are not permitted. The more money saved comes to be treated as something put aside for old age, and not as something liable to the more frequently arising needs of a rainy day, the better the object of the State in providing these facilities will have been answered.

The department of Post Office thrift which gives most room for extension is that of annuities and life insurances. As yet neither of these modes of disposing of money is at all equal in popularity to that of simple deposit at call. As regards the latter, it is easy to understand why this

should be the case. The money invested in life insurance is altogether withdrawn from the control of the investor, and it provides against contingencies which do not come keenly home to the English poor. They are anxious about contingencies that may befall them at any moment, such as sickness or loss of work; and sometimes, though less often, they are anxious about old age. But the notion of realized wealth is too unfamiliar to them to create any strong desire to leave money behind them. That passion for saving for their children which is so strong in the French people is hardly known to them. Their idea of insurance is that of payments effected by present self-denial in order to secure a benefit that can never be realized until they have become unable to profit by it. As regards annuities, however, there is no good reason why they should not be popular. The very indifference of the English poor to leaving money behind them ought to dispose them to a mode of investment which secures that the investor himself shall reap the whole benefit of his savings. The figures referring to deferred annuities, in particular, are of a kind which seem very well calculated to attract purchasers. If a man of thirty has 50*l.* in the Savings Bank, that does not seem a very large sum to pay for an annuity of 20*l.* a year to begin when he is sixty. The comparatively easy savings of his youth may thus be made to secure their owner against want when he is growing old.

More perhaps might be done to make the purchase of deferred annuities, on the principle of the premiums being returned in event of death or inability to continue the payments before reaching the age of 60, better known. The example given in Mr. FAWCETT's pamphlet is that of a man of 30 buying an annuity of 10*l.*, to begin when he is 60, by an annual payment of something over 2*l.* If at 50 he dies, or ceases to pay any further premium, he or his representatives will be able to claim the money, just over 40*l.*, which he had paid up to that time. Considering how little store the poor seem to set by the interest accruing on their savings, it is surprising that this mode of using them is not more popular. The principal is not lost until the age of 60 is reached, and then it is only foregone in consideration of a proportionately large annuity. It is worthy of Mr. FAWCETT's consideration whether some further variations in the methods of purchasing annuities cannot be devised. The experience of the American insurance offices goes to show that the wants and circumstances of insurers are immensely various, and that the more closely the alternatives held out by insurance offices correspond to these wants and circumstances the more they attract purchasers. No doubt the Post Office is hampered by the low interest which, in comparison with private insurance societies, it is able to obtain for the money deposited with it. The American Companies owe most of their success to the large returns they make on their investments, and the correspondingly large offers they have been able to make to insurers or buyers of annuities. The Post Office can invest in nothing but Government Stock, nor is it desirable that an institution holding and giving a Government guarantee should be authorized to deal with more speculative securities. But something may be done to render the offers of the Post Office as attractive as variety can make them. Purchasers of annuities like to see that their individual wants have to some extent been consulted, and that, alike in the manner in which the premiums have to be paid and in the manner in which the annuities are to be enjoyed, the convenience of the annuitant has been kept steadily in view.

THE BURNETT FOUNDATION FOR DEFENCE OF THEISM.

THE debate in the House of Lords on Monday last on "Burnett's Literary Foundation" was of some interest in itself, and derives still greater interest from the subject to which it referred. Let us first briefly recapitulate the facts of the case, with which our readers may probably not be familiar. It appears that in 1783, Mr. John Burnett of Dens, in the county of Aberdeen, enacted a deed of endowment conveying to certain trustees rents to constitute a fund out of which, at intervals of forty years, two prizes should be given for the best essays in defence and confirmation of Theism, the choice of judges for deciding on their merits being left to the Principal and professors of the University of Aberdeen and the ministers of the town. These prizes were awarded in 1814 and 1854, and will, according to the existing arrangement, have to be again awarded in 1894, when the capital

sum, which is constantly increasing, will have reached 6,000*l*. The present Trustees of the Fund however—Mr. Grant Duff, Dr. John Webster, and Sir John Clark—have applied to the Home Secretary, under the Endowed Institutions (Scotland) Act of 1878 for powers to convert the fund into one for a course of lectures to be delivered annually on "The History of Religious Thought, with special Reference to Theism and the Sanctions of Morality." Against this scheme protests have been lodged by the Senate of the University and the ministers of Aberdeen. To the proposed diversion of the fund from prizes to be given for essays every forty years to the endowment of annual lectures they raise no objection, nor is it easy to understand what objection could well be made to a change so obviously reasonable. But they protest against the scheme on the ground of its providing no guarantee that the lectures might not be so framed as to aim at subverting the very theistic doctrines which it was the precise object of the founder to uphold. The Commission under the Endowed Institutions Act reported in conformity with their protest, but the Home Secretary nevertheless overruled their objection and restored the scheme to its original form, on grounds which do not certainly appear to be very conclusive. Dr. Webster stated, in his evidence before the Commission, that the Trustees did not consider it desirable "to continue the controversial and polemical theme" suggested by the founder, and Sir John Clark said that "his impression was very strong that, if Mr. Burnett were now living, he would almost certainly divert the fund to totally different uses from that to which he did apply it." This method of reasoning about the probable intentions of the pious founder, if he was now alive, is to say the least highly precarious, especially if it is meant to cover a proposal for diverting his endowment to purposes not only totally different from those specified by himself but directly contrary to them. The Duke of Richmond, who led the opposition to the scheme in the House of Lords, had no doubt a fully equal right to his own "impression that, if Mr. Burnett were alive now he would appoint neither Dr. Webster nor Sir J. Clark to act as his trustees." But there is really no need to enter on a discussion of these rival "impressions." Lord Rosebery, who defended the proposed scheme—which however the Government have withdrawn—expressly stated that it was no part of the design of the trustees to make the teaching of *theism* possible under it. All he said in favour of substituting an annual lecture for periodical prize essays was reasonable enough, but at that point no difference of opinion is alleged, and it is therefore superfluous to dwell upon it.

The force of Lord Rosebery's objection to maintaining such means of defending Theism, "when we have the great hierarchy of England, the great hierarchy of Scotland, and all the dissenting bodies that exist in the United Kingdom" is not quite so obvious, and what precisely is meant by "the great hierarchy of Scotland" we do not profess to understand. The Established Church of Scotland would indignantly disclaim having anything that can be called a hierarchy; there are indeed two hierarchies in that country, the Episcopalian and the Roman Catholic, but they have probably enough to do in attending to their own ecclesiastical affairs without specially devoting themselves to the work of theistic apologists. And the contention that, because Christian Churches—which did not by the by first come into being since Mr. Burnett's time—exist, there is a case in endowing essays or lectures for the promotion of piety and the upholding of religious doctrines is one that would prove fatal to good many established and unquestioned institutions besides the Burnett literary fund. Still more marvellous—in itself, though not in its origin—is the argument of the *Times* last Wednesday that "the world has long been in possession of the *a priori* arguments on theological matters, drawn from 'considerations independent of written revelation,' and there can be no addition made to the huge volumes in which they are all to be found," from which it is inferred that any fresh defence of theism is a work of supererogation. To most persons, not writers in the *Times*, it might possibly have occurred, first, that any argument for theism must from the nature of the case be based on "considerations independent of revelation," and that so far at least Mr. John Burnett had only shown his sound sense. Every revelation necessarily assumes at starting the reality of the Divine Being from whom it professes to emanate; it is worse than idle to rely on the wording of the message till you have some assurance who it was that despatched the messenger. And in the next place, a very moderate amount of information—and experience warns us not to be too exacting in that matter in our demands on the great Jupiter—might have sufficed to suggest that there are not many doctrines, philosophical or religious, deemed of any importance among mankind, concerning which the world has not "long been in possession of," not only "huge volumes," but whole libraries full of apologies. But to say that "no addition can be made to them" is to forget—that "the history of religious thought" abundantly testifies—that as long as each successive generation has its own way of looking at the questions which come before it, the same doctrines, however true and unchangeable in themselves, will inevitably require from age to age a different method of treatment, if they are to retain their place in the hearts and convictions of men. And if there is one tenet more than any other to which this remark conspicuously applies, it is that fundamental principle of all religious belief, which Mr. Burnett made it his object to uphold and perpetuate by the institution of his prize fund, and the importance of which in its bearing on the evidences of Christianity is increased rather than

diminished in the course modern controversy has taken. So far then nothing can be more rational and consistent than the argument for maintaining his foundation in its integrity, if any regard at all is to be paid to his avowed purpose in devising it, or more irrelevant than the objections urged against it. But it is another question whether the particular method of carrying out this design which approved itself to the founder's judgment a century ago is still the most suitable for the purpose. And here, we cannot but think that the Trustees have a very good ground for their proposed alteration. As it is now officially explained that they had no intention of permitting the lectures, which they desire to substitute for prize essays, to be made available for atheistic teaching, a slight verbal change in the definition of the subject matter would meet the, perhaps overstrained, objections of their critics. Suppose, instead of "The History of Religious Thought with special Reference to Theism and the Sanctions of Morality," the subject of the lectures was defined to be "The History of Religious Thought with a special view to exhibiting the Evidences of Theism and the Sanctions of Morality," all fair pretext for objection would be cut off, and the lecturer would still be left free to handle his theme in any manner he might prefer, so long as he did not turn it into an assault on the fundamental principle his discourses were intended to illustrate and recommend.

We are of course fully aware that the scheme of the Trustees, with this formal modification or rather explanation of its terms suggested above, would still involve a good deal more than a change from an occasional prize essay to a course of annual lectures, though even so it would be a decided improvement on the original design. The lecturer would no doubt have much larger scope left him in the treatment of the subject—larger both in extent and in kind—than is assigned to the essayist under the terms of Mr. Burnett's will. But we are entirely agreed with the present Trustees in thinking, for reasons which have been already indicated, that this would be a very great advantage. There are few points in which the speculative attitude of mind of the present day differs so widely from that of a century or two centuries ago as in its way of looking at the evidences of religion, natural or revealed, and especially the former. The original form of Mr. Burnett's bequest was indeed modified, or at least abbreviated, in a subsequent codicil to his will, which is less precise and stringent in its wording, but there is no inconsistency between the two documents, and it is only natural to interpret the shorter by the longer and more explicit form, as embodying his own mind on the subject. The earlier form, in which we have italicized certain words, runs as follows:—

That there is a Being all-powerful, wise, and good, by whom everything exists; and, as the power of the Deity is easily shown, in pointing out the consideration particularly by which, notwithstanding the pains we are often subject to, we may hope and trust in the goodness of the Deity, both in this state and in the reasonable expectation of a future one; and in taking notice of the comforts arising to mankind from these considerations, independent of revelation; and, further, in considering these as confirmed by the blessed Jesus sent by God.

The form finally adopted in the codicil is this:—

That there is a Being all-powerful, wise, and good, by whom everything exists; and particularly to obviate difficulties regarding the wisdom and goodness of the Deity, and this, in the first place, from considerations independent of written revelation, and, in the second place, from the revelation of the Lord Jesus, and from the whole to point out the inferences most necessary for and useful to mankind.

These directions unmistakably point to the familiar argument from final causes, with which Paley's name is specially associated, as evidencing alike the wisdom and beneficence of the Creator, and that notoriously was the favourite argument of the Evidence writers of the last century on natural religion, just as the argument from miracles was their chief plea for revelation. One of the keenest intellects, and most uncompromising, not to say impassioned, theists living, Cardinal Newman, has again and again avowed his indifference to the argument for final causes, not to say his distrust of it. And to refer to a distinguished thinker of a very different school, J. S. Mill, who in spite of his studiously atheistic training cannot certainly be said to have had an irreligious mind, is so far from recognizing what seemed to Mr. Burnett and so many others of his age the palmary argument for theism that he considers it one of the great, if not insuperable, difficulties in the way of acknowledging "an omnipotent as well as perfectly just and benevolent maker and ruler of such a world as this." Our readers will recollect his tremendous indictment against the "hideous" and "ingenious cruelty of nature," which does every day almost everything men are hanged or imprisoned for doing, and his conclusion that "the order of nature is such as no being, whose attributes are justice and benevolence would have made," if he was also omnipotent. We are expressing no opinion here as to the value of these criticisms, but they serve to show how very differently arguments once felt to be the most persuasive strike men's minds in our own day. Kant in Germany, and Coleridge in England did much to discredit the old method of evidential reasoning, and to lead religious apologists, whether for theism or Christianity, to rely chiefly on moral and internal evidence. Kant himself insisted on the argument from conscience for the being of a God, and in this he has been followed, unconsciously most likely, by Cardinal Newman. Even in dealing with the proofs of Revelation modern apologists always lay special stress on the moral and internal evidence, as may be observed for instance in the recently published works of two distinguished divines, Dr. Barry's *Boyle Lectures on the Manifest Witness for Christ* and Mr. Wace's *Bampton Lectures on the Foundations of Faith*. The

Gospel generally, and its separate doctrines, are usually represented as expressing or illustrating great moral truths which give them their persuasive power. And it has accordingly come to be very widely acknowledged on all hands that the same line of argument, whether for attack or defence, will apply in great measure to the case both of revelation and of theism, and this of course gives to the controversy on the latter point a more crucial interest. Thus Mr. Mill considered that "the Christian religion is open to no objections, either moral or intellectual, which do not apply at least equally to the common theory of Deism; and the morality of the Gospels is far higher and better than that which shows itself in the order of nature." The questions therefore about which Mr. Burnett was interested have a yet deeper interest for thinking men in our own day, only we are disposed to approach them from a new point of view. And it is most desirable that in carrying out the spirit of his bequest this difference, which is partly an intellectual and partly an ethical one, should be taken into account; not because, as the *Times* strangely asserts, "no addition can be made to what has already been said on the subject," but for the precisely opposite reason.

FREE SALE.

THE final announcement, after many assertions and contradictions, that the five Irish Land Commissioners, Lord Bessborough, Mr. Shaw, Baron Dunsay, The O'Connor Don, and (with protests) Mr. Kavanagh, have recommended the adoption of a scheme which is practically the three F's somewhat modified, will surprise few people, though it may disappoint many. But it makes more urgent than ever the deliberate consideration of the meaning of the pances. We have already dealt with Fixity of Tenure—the subject of Mr. Gladstone's most effective denunciation ten years ago—and with Fair Rents, the most attractive, but perhaps the most practically unattainable of the triad. There only remains Free Sale. It is to no purpose probably—argument is usually to no purpose when it faces foregone conclusions—that Lord Dufferin has demonstrated the mutual antagonism, not to say the mutual destructiveness, of Fair Rent and Free Sale. The weighty, though little regarded, demonstration which Sir Robert Anstruther gave about the same time of the intrinsic harmfulness of the third F is the chief point which may be relied on still. The intentions of the Government as to their Land Bill are still in darkness, and, remarkable as the faculty for development has always been in Mr. Gladstone's case, it may be thought that even he, after denouncing the property of the tenant in his holding as a dangerous delusion, will hardly proceed to maintain it as a sacred right. But—with Mr. Gladstone at least—the unexpected always happens, and it has to be faced. Let us again, for the sake of argument, grant that Fixity of Tenure—if it can be attained with provision against the great evils of Irish farmer-life, subletting, subdivision, and, most wasteful, ruinous, and benumbing of all, the system of conacre—would be a good thing. Let us grant that the fair vision of Fair Rents, even if it be a thing which, as in Mr. Tennyson's poem, "fleets Down the waste waters day and night," would be still fairer if it could be caught up. It would still be demonstrable that Free Sale is in itself pernicious and calculated to destroy, or very greatly to reduce the productiveness, of the land, the main object upon which, according to land conservatives and land reformers alike, we ought to set our hearts.

The demonstration is twofold, and can be made to approach the subject both *a priori* and *a posteriori*. It is an axiom in modern farming that without capital the gods themselves need not attempt to take a farm in any part of the Old World. There is no longer in any part of Ireland, any more than in any part of England or Scotland, virgin soil which, for the mere trouble of scratching it and scattering seed upon it, will return thirtyfold, or sixtyfold, or an hundredfold to the tiller. What has been taken out of the ground must be returned to it in one shape or another, and the process of returning costs money. Again, the margin of agricultural gain is now so narrow, and depends upon so many circumstances, that an average of years is absolutely necessary to secure it. Now Free Sale even in England or Scotland would not be prejudicial on this score. The Free Sale system supposes that the incoming tenant has a double capital—one to be sunk in the purchase of goodwill, the other to be expended on the land. Does this double capital exist? It is perfectly certain that it does not. Except in the shape of a fine affecting his rent—that is to say, in a manner prejudicing the operation of fair rent—no experienced and reasonable tenant would give a heavy premium for the goodwill of the best farm in Norfolk or the Lothians, let alone the impoverished soil of the greater part of Ireland. He knows perfectly well that his predecessor, if he knows his business, will have got out of it what is to be got; if there be anything remaining, he is perfectly willing to pay compensation for unexhausted improvements. But compensation for unexhausted improvements is not in the least what is meant by Free Sale. And here we come to the second branch of the argument. Free Sale would have no existence in the fancy of Irishmen were it not for the almost insane desire on their part to make a living out of that land in some other way than by honest and straightforward labour. The land, it is an unfortunate truth, is the Irishman's *petite bourse*, his Monte Carlo, out of which he hopes to make a profit by shrewd gambling. Middlemen, subdivision, subletting, conacre, and, lastly, Free Sale are all the

result of this unlucky frenzy. But without Free Sale, and with prohibitions on the other devices, it is possible, though barely probable, that the plague might be stayed. With Free Sale, even if other limitations were strictly enforced, this is not possible. Debarred from subletting, forbidden to divide his holding, precluded from conacre—the plan of allowing a third person to crop the ground, or a part of it, for a single harvest—fixity of tenure would still leave Free Sale, if that were legally permitted, as a method for the transformation of the land into the subject of the transactions of a disreputable and unregulated Stock Exchange. For it must be remembered that the profits of land cultivation are essentially variable. Hardly the most experienced farmer who ever turned the storm-swept flats of Lower Moraysire into a garden, or helped to transform the Southern Scottish Lowlands from the worst cultivated country in Europe into the best, would undertake to say what the return of a given acreage will be in a given year. The unknown must always enter into the calculation, and where it enters gambling comes with it in the case of the Celt. Long leases, with strict observance of contract and no expectation of escape, on the one hand; yearly tenancies at will, with the understanding of handsome remissions in the case of good tenants, and more or less stern eviction in the case of bad ones, on the other, supply a check upon this tendency. The right of Free Sale, indiscriminately conceded, would be a direct encouragement to it. In the case of Ulster Tenant-right the evil—for even there it is probable that it is an evil—is minimized by the fact that the incomer's price, as a rule, represents something solid in the shape of benefits purchased by the outgoer for himself, and by the different nationality of those who enjoy it. In the case of the rest of Ireland the right of Free Sale would be a clear bonus conferred on the tenant in the shape of a stock in hand to gamble with. He would sell his holding for what he could get, and with the price he would speculatively buy another holding on the chance of getting by sale still more for that. Free Sale, judging from the experience of the past and from probability, means in the case of *bona fide* farmers the deprivation of the capital necessary for proper cultivation, in the case of land gamblers the substitution of mere land-jobbing for steady agriculture. Now the Irish have not the head for any form of jobbing. They will and must "plunge." A widespread bankruptcy, with the immediate consequence of a worse agitation than any yet seen is the consequence—the certain and sure consequence—of the extension of the right of Free Sale without consideration paid to the three southern and western provinces of Ireland. It is idle to say that this is mere arbitrary prophecy. We do not believe that a majority of any assembly whose members were acquainted with the facts and unpledged to party, could be got to affirm that it is not the most probable result of the plan.

A recently issued book, much of the material of which has been commented on in these columns as it appeared from time to time in the *Daily News*, confirms these views very remarkably. Mr. Bernard Becker, whose *Disturbed Ireland* Messrs. Macmillan have just published, has given a very entertaining and, on the whole, a very impartial view of the present state of things in Connaught and Munster. Mr. Becker seems to have started on his journey in an unbiassed frame of mind, and his conclusions exhibit the effect produced on such a mind by the events it had to consider very well indeed. The consistency which perhaps is itself only consistent with a *parti pris* is not indeed Mr. Becker's. He sympathizes deeply, and almost indignantly, with Captain Boycott, with Colonel O'Callaghan, with Mr. Townsend of Killinaue, with Mr. Bence Jones; but he roundly insinuates that the Boycott expedition was an electioneering manoeuvre; and he seems to regard the disinclination of the Irish to see anything specially sacred about rent as a rather sensible frame of mind. On this last point one is inclined to join issue with Mr. Becker, and perhaps on this point only because it involves little partisanship of any kind. Mr. Becker thinks that "there is no argument in favour of the landlord which every other creditor might not equally advance." There is this argument, which Mr. Becker forgets, that the value received from the landlord is a value intended to bear profit. When a man buys a pair of trousers or a loaf of bread he does not intend to make money out of those commodities; and if, before paying for them, he does make money out of them, by pawning or resale, Mr. Becker will find that, by the law of England at least—a law not objected to by the staunchest Radicals—he is subjected to very awkward consequences. The landlord is precisely in the case of the tradesman in these latter and exceptional contingencies. The tenant who, not paying his rent, nevertheless sells his crops, is exactly in the position of a man who buys a watch from A., and, before paying for it, sells it to B. Yet the law takes a milder, not a sterner, view of the tenant's delinquency. We have no desire to press this view against the author of *Disturbed Ireland*, because he very frankly admits that his book is a book of pure observation. But the fact is of considerable value in reference to another point, with regard to which we have specially cited Mr. Becker, the question of the Irish cultivator's attitude towards the land. Clearly, from what has been just said, our author is not prejudiced against the peasant. Yet Mr. Becker says, in so many words, that "the Western cultivator is far less a farmer than a cattle-jobber or gambler in stock"; and the whole of his book goes to prove that this now famous person is far less a farmer than a gambler in land and everything that can be got off or out of land. Much of Mr. Becker's book is one long jeremiad over the impossibility of getting a good day's work out of the peasant of the South and West. But his wits are tolerably sharp. He has the gambling

instinct, and everybody round him has it too. To such a man Fixity of Tenure and Free Sale are, as has been said, simply a stock in trade for gambling. The produce of his farm, which is the nominal stake, comes in such a case to be like the tulip bulb, *Semper Augustus*, a thing non-existent, and the existence of which is not considered though its market value grows higher and higher. It is said that eviction exists nowhere else in the United Kingdom. Is there any other place in the United Kingdom, it may be replied, where eviction is required? It is a sharp and rough spur, no doubt; but, if the horse is to be ridden, it is not clear what other means are to be tried. Instead of this, we are asked to take off bit and bridle, to give ample seeds of corn, and to leave the rider to sit as best he may. It may be said, according to modern jargon, that the objection to this overlooks the responsibility of Governments, which is to give happiness to the governed. To this we can only answer that such may be the duty of the Government of a *pays de Cocagne*, but certainly of no Government in this workaday world. Justice, equal laws, and the tools to the workman are all that can be required of a Government, not perpetual administration of gratuitous pap. The three F's are of the nature of this last, and therefore they are intrinsically objectionable. But if they were not of that nature, there would still remain the objection to them that they are certain to aggravate the disease they profess to cure, and to render a speedy and acute return of it certain. We may not be governed with much wisdom, and it may be hard to get our 650 chosen ones to look at anything with thirteen hundred reasonable eyes. But if a majority of those eyes look with favour on the three F's, then political blindness may be pronounced to be the rule among the temporary governors of England.

MANNERS AND CUSTOMS OF FISH.

THE late Mr. Frank Buckland was, at all times, a most amusing writer; but probably none of his contributions to natural history are more brilliant and diverting than his posthumous book on *British Fishes* (S.P.C.K.) The results of Mr. Buckland's observations were widely different from those of Mr. Spencer's speculations. He did not believe in "evolution," and, in the preface to his charming work, says that he thinks the case for special creation and design is good enough to take before a jury of "the most eminent and skilful railway and mechanical engineers." We do not propose here to enter into an argument about evolution. One objection to that theory, at least in the hands of its most thoroughgoing advocates, is that it explains everything rather too easily. Things can scarcely be so simple as they are supposed to be by the kind of evolutionist that can account, in an hour or so, for the origin of anything you please, from the dagger in the tail of a sting-ray to the milk in the coconut. Mr. Buckland saw in the mechanism of fish "evidence of design and forethought, and a wonderful adaptation of means to ends." We propose to examine one or two specimens of the mechanism of fishes before going on to consider Mr. Buckland's countless anecdotes about the intelligence and the customs of these creatures.

Take the barbel, for instance. When the barbel is hooked, his first idea is to do what salmon very often do—to slash at the line with his tail. For breaking the line with his tail, the barbel has advantages all his own—that is to say, if he can turn himself round so as to bring his back fin to bear. The first ray of his back fin is cut into deep notches just like a saw, and a scrape with this saw would probably prove too much for the line, and set the barbel free. He has another use for this ray; he employs it, like the mast of a London barge, to keep his fin taut, when he wants to make way against the water. These advantages of the barbel your ready evolutionist could explain in the twinkling of an eye; but, as we have said, explanations are sometimes difficult to accept in proportion to the facility of their manufacture. The barbel is horribly nasty, but "the Jews eat him during their holidays," by way of handicapping their propensity to be too jolly, we presume. The little river bull-head, again, has peculiarities of a very useful sort. He has two very sharp spikes on each side of his gill-cover, and, when he is swallowed by a grebe, he acts like that boy mentioned, according to Bacon, by Busbequius, who "gagged, in a waggishness, a long-billed fowl." This is precisely what the bull-head does; as soon as the grebe gets hold of him, he shoots out his spikes, refuses to go forward or backward, and so kills the bird. In April, last year, Mr. Buckland received from Lord Radnor a grebe which had thus been throttled by a bull-head. "The fish was fixed so firmly in the bird's mouth, that I found it would go neither backwards nor forwards." Mr. Buckland knew two or three examples of bull-heads which had thus assassinated kingfishers, with pleasing circumstances of resolution and good taste.

Now the wild evolutionist asks nothing better than to account for this peculiarity of the bull-head. "Observe," he will say, "the configuration of the bull-head. Originally he was shaped much like a minnow, and coloured to match." The evolutionist always knows what existed "originally." As time went on bull-heads were almost destroyed by kingfishers and grebes. Those only survived who had large heads, and therefore could not conveniently be swallowed. Hence the enormous head and mouth and very small body of the bull-head. But, as kingfishers and grebes, by long inherited experience, acquired the art of swallowing bull-heads tail first, the fish were again in danger of extermination.

None escaped except the descendants of a bull-head which happened accidentally to possess two very sharp spikes on each side of his gill-cover. His progeny inherited these spikes, and, in the struggle for existence, naturally were more fortunate than the spikeless bull-heads. Therefore all bull-heads now have spikes; and grebes, finding them awkward to tackle, prefer to leave them alone." This seems a very fair piece of evolutionism, as times go. The same arguments naturally apply to the development of the sea bull-head, fatherlasher, or sting-fish. A man who was fishing with a shrimp-net caught a sea bull-head. Not being a fastidious person, he, "without thinking, tried to bite its head off. The fish gave a sudden kick, and slipped down the man's throat; it then expanded its gills, the spines stuck in his throat, and he was shortly suffocated." Probably primitive or Palæolithic man was always trying to bite off the heads of father-lashers, till, in the process of the æons, the fish evolved a repartee to that dirty trick, and men, as a rule, have dropped the practice.

When we turn from evolution to facts, Mr. Buckland's book is found to be full of odd and amusing pieces of information. For example, Mr. Buckland knew the London establishments where sprats and young herrings were made into whitebait, and where whitebait were made into anchovies. This is perhaps the most rapid and authentic example of evolution within the ken of science. In 1871 more than a hundred thousand anchovies were caught in Cornwall; and, as no one knew how to cure them, they were carted away to the fields as manure. Speaking merely by guess, we are inclined to think that a good deal of French polish is used in the curing of anchovies. Mr. Buckland mentions as a fact that thousands of sprats are sold in the form of anchovy paste. He rather indiscreetly gives minute directions for making anchovy paste out of sprats. Two pounds of salt are used, and a pound of saltpetre; what follows is very peculiar. Birth makes the anchovy, want of it the sprat; the rest is all mere cochineal and—prunella! Two ounces of prunella, with a few grains of cochineal, are the proportions. Pound in a mortar, and put in a stone jar alternate layers of sprats and of cochineal, salt, saltpetre, and prunella. Press hard down, and cover close for six months, when the mixture will be fit for sale.

A hideous fish called the angler, or fisher-frog, is happily rare on our coasts. His stomach holds a bucket of sawdust. The creature fishes for other and more natural members of the flock of Amphitrite with two short night-lines, which he wears in the top of his head. He opens his mouth, and hangs out his bait; other fish make a rush at it, and he sucks them down into the stomach that holds a bucket of sawdust. It must have taken the angler-fish some time to evolve this "aisy stratagem," as Captain Coitigan might have called it. Mr. Buckland examined the "cruel" of one fisher-frog, and found that the animal had made a very fair mixed basket. It had taken two mardy-soles, one common sole, one piked dog-fish (1 ft. 6 in. long), three moderate-sized crabs, fourteen five-fingers, and one whiting.

Worms and fish are kindred topics. Among the many queer fish he discovered, Mr. Buckland lighted on a man who kept a farm of worms for bait. They are caught at night, by people who go about the fields with lanterns. A short, fat man is no use at worm-catching, his steps alarm the quarry; but a long man, who makes use of his reach, can stand still and pick up all the worms within a considerable radius. Mr. Buckland had a tall friend who was backed to catch worms against him any night, starting from scratch, and giving Mr. Buckland a start of one thousand worms. But the match never came off. Talking of worms, Mr. Buckland is vexed with the cruelty of men who pack live eels tight in baskets, but he himself recommends a not very kindly French way of ground-baiting for carp. You take a piece of sod and stitch red worms all over it, with needle and thread, and then throw it into the pond. This is not a very merciful dodge.

Bleak are remarkable for being able to thrive in the Severn, "in water ink black from the waste dye of a manufactory." We can bear witness that very respectable trout preserve a silvery appearance where the polluted Teviot is inky below Hawick. Mr. Buckland says, "It was very satisfactory to find from the presence of the bleak, that this particular pollution could not be very injurious to salmon life." Perhaps not, but it is abominably hideous, and there is no pleasure, but the reverse, in fishing in, or walking beside, a river polluted by waste dye. Few people, probably, are aware that *Essence d'orient*, the stuff with which sham pearls are made, is manufactured from the scales of the bleak. The invention is due to one Jaquin, who made rosaries in Paris about 1680. Of all fish the chub is the hardest to catch, and the most useless when you have caught him, while the bream is the most unpleasant to handle, and is angled for with the most noisome and offensive bait. The basis of the ground-bait is "half a pailful of bullock's blood," and the rest of the composition would have disgusted the witches in *Macbeth*. Bream are the oldest inhabitants of many ponds. Mr. Buckland shows that the white mould which gives some carp a venerable appearance is not really the result of extreme old age, but of disease. He does not consider a hundred years out of the way for a carp's lifetime. The Welsh *Mabinogion* represents the salmon as about the most long-lived of animals, but it is very difficult to collect statistics about fish of migratory habits. Carp, in Ireland, have been mistaken for fairies by the gentle and romantic peasantry. The rings made by the fish, as they poke up their snouts and suck down air, were conceived to be the circles formed by the nimble feet of dancing elves. The cat, or wolf, fish might be mis-

taken for demons by the trustful, guileless natives of Connemara. The mice of the cat-fish are crustaceans, which it catches and crushes with teeth of unusual strength. Like the walrus,

Cet animal est très-méchant;
Quand on l'attaque il se défend.

"Not unfrequently it enters the nets of the fishermen to plunder them, and when attacked fights like a lion." It is almost the ugliest fish that swims. The Germans call it the "stone-biter." Mr. Buckland thought the fish rather good to eat. It should be a favourite in Germany, for it tastes like veal-outlet. The Chimæra, or rabbit-fish, is not very pretty, but, still, a beauty compared to the cat-fish. Mr. Buckland was incorrect in his belief that the question as to the "Chimæra bominans in vacuo" was originally set for the edification of the Royal Society in its younger days. The puzzle is a good deal older than the Royal Society, and the Chimæra was suspected of being able to eat second intentions, not "to produce secondary causes." Mr. Buckland had in all respects a higher opinion of the perch than we have ever been able conscientiously to entertain. He thought that the perch gave good sport to the angler, was excellent to eat, handsome, and highly intelligent for a fish. In fact, the perch is in ponds what the Wise Man of the Stoics would be in society. We venture to differ from this flattering estimate. Perch are slow to fish for, bony when cooked, and so dull that we have known one perch to swallow the baits of two rods, and be simultaneously hauled out of the water by two anglers. Eels, in all countries, seem to respond eagerly to electric influences. "The first day that it thunders in March, the eel leaps in the pond, they say," in Italy. Mr. Buckland knew an old eel-fisher who habitually bent a drum to make the eels bestir themselves, under the delusion that there was thunder in the air. With this last anecdote we must leave the ways and habits of fishes, a topic on which Mr. Buckland probably knew more, and could discourse more amusingly, than any man whom he has left behind him. Science we have always with us, but science with high spirits and a strong sense of humour is difficult to find.

CURLING.

A FEW years ago there were grave apprehensions in Scotland that curling might become a forgotten art. Now that the old-fashioned winters have set in again with aggravated severity, all fears of the kind are dispelled in the meantime, and, on the contrary, the curling clubs have been spreading in parishes and districts that never used to know them. We remember a time when the roaring game was seldom played far to the north of Tay. Now it is common enough in the north-eastern counties; while the new proselytes have naturally made rapid progress, since keen and protracted frosts are specialties of their storm-beaten districts. A very good thing it is that it should be so, since the curling-pond does more than even the Southern hunting-field to promote sociability among all conditions of men. On the ice the best curler is the best man, be he laird or loon, as they say in Scotland. And a hard frost sets almost everybody free to "take his diversion" without any *arrivée pensée*. The Scotch countryman rarely indulges himself with a holiday; for in his expeditions to the nearest market-town there is more of business than pleasure. Yet no one enjoys a holiday more when he can go about his pleasuring with a quiet conscience, and his days on the ice come direct to him from Providence. The nights have been growing sharper and sharper, so that the farmer's labours of a morning have been delayed later and later. At last even the warmth of the wintry sun at noon scarcely suffices to melt the hoar frost in the shade. The fields are bound in iron, so that the ploughs must be "loosed" perforce, and the horses left eating their heads off in their stalls. The ditchers and drainers can do no more than their employers, and for all the wages they can earn abroad they may as well fold their hands across in the "ingle neuk." In short, out-of-doors work of all kinds is at a standstill, and the only man who is busy is the blacksmith, who is doing literally a roaring trade in the heat of his blazing forge. But the forge, though the general centre of attraction, comes to be only frequented after dark. The parish pond is bearing, and the curlers are out. As the morning mists are clearing and lifting, when the sun begins to show over the tops of the fir plantations, many a stalwart figure may be seen emerging from lonely farmhouse or humble cottage. In such circumstances, the sturdy Scotchman, though warmly clad, leaves as a matter of course the "big coat" behind him, which he would don were he to go out driving in his gig. But it is his habit to take especial care of his throat, which is roughly swathed in a coarse red comforter, the ends of which are crossed and buttoned away under his homespun shooting-coat. Armed with a formidable besom, cut from the "broom knowe" behind his house, he strides ahead over the crackling roads, with the air of a man somewhat late for business. Though the hour is early and he has breakfasted betimes, yet, knowing full well the keenness of his curling *confères*, he fears that the sides may be chosen before his arrival. After what may be a sharp walk of several miles, as he tops the crest of a commanding eminence, he sees figures magnified by the mists converging from all sides towards a rallying-point whence his listening ears can already distinguish the dull murmurs of distant voices. Taking the shortest cut down the hill and descending it almost at the double, he hurries across the intervening fields more quickly than before. A turn brings him in sight of the curling-

pond, which is an irregular sheet of water in a hollow, fed by a brook flowing through haughs and meadows that once were famous for snipe and wild duck, before draining and reclaiming had come so much into fashion. The skirts of the pond are crowded by all the parish "callants" and hobbledehoyes, either alighting or dashing about doubled up in most ungainly attitudes on rusty skates, or, more probably, on a single one. But the central parts are respectfully reserved for the "rinks," and there the curling notables of the neighbourhood stand clustered together in a group.

If our friend is famous among the men mighty with the stones; or, if, although but a moderate performer, he is distinguished for his social qualities, he is sure, while yet a long way off, to be greeted with friendly shouts. In fact, on the curling-pond, and on an invigorating day, everybody is ready to shout on the slightest provocation; and as one man must bellow against another in self-defence, curling may well be called the roaring game. Our friend's fears of being belated were so far delusive that he has turned up in the nick of time. The players for the first party are being picked; a great moorland farmer having to figure as skip on the one side, while the village shoemaker acts in the same capacity on the other. "The laird himself," to whom the farmer in question pays several hundreds of pounds in rent, is a good man on the ice so far as he goes, and as keen a curler as there is in the country. But, as his execution is scarcely so trustworthy as his judgment, he yields the places of pride to his weather-beaten tenant and the cobbler, falling modestly in with the rank and file. The stones have been forwarded already to the waterside, and the "tees," lines, and circles have been carefully described under the intelligent supervision of the parish schoolmaster. The worthy minister is on the spot to sanctify the sport with his presence were it needful. But to do the mixed party of players the barest justice, if the mirth is obstreperous, it is seldom coarse, and never blasphemous; though, now and again, frail human nature will rap out an oath under strong provocation. Time was, and not so many years back, when the minister would have been among the foremost in the active part of the fun; but now the good man is going down the incline of years and "sair troubled with a houst (or cough) in the pulpit"; and he has been solemnly warned by the friendly doctor that he must sacrifice his curling to the discharge of his duties. Yet his fingers itch, and he has something like a St. Vitus's dance in his arms when the first of the ponderous stones is sent smoothly gliding over the surface, and he sees his parishioners flourishing their idle brooms. Idle, indeed, when the ice is like glass, and the mercury a dozen degrees below the freezing point. The difficulty is to hold back the stones, heavy as they are—once started they will move onward by their own momentum. Should they go beyond the "tee"—the mark from which they are to be measured when the end is played out—they are wasted to all intents and purposes; while, if they come to a stop short of what is known as the hog-line, they are "hogs," and swept aside as out of the game. In the beginning the object is to play the stones short of the tee, so that they may be "promoted," or knocked nearer to it afterwards; and of course, when a stone has been advantageously placed and left where it is by the succeeding player on the opposite side, the urgent consideration is to "guard" it. It is to be guarded by placing a second stone so as to interpose between it and the succeeding players. The excitement becomes most intense when, the game being a close one, and drawing on to the finish, the stone that lies nearest to the tee is almost or altogether invisible. It might seem at first sight to the uninitiated that there is nothing left to be done except to play down the ice with tremendous force, trusting to change things for the better in the general convulsion. But a remedy so desperate is only had recourse to in the last resort, and it commends itself most reluctantly to scientific players. When the state of things is so delicate, you see the skip and his chief counsellors laying their heads together in rapid consultation. He corrects or confirms his decision by their suggestions, and then proceeds, with a grave sense of responsibility, to play the momentous shot. The fairway to the stone that should be his mark, as we said, has been blocked entirely. So he directs his own stone to the right or left, as the case may be, and apparently, gently played as it is, it has been despatched on a bootless errand. But, when it has glided straight forward for half the distance or more, you may detect a perceptible tremor in the handle. By a dexterous turn of the wrist in the moment of despatch the player has given it the necessary side; it comes softly and gracefully inwards, "curls" round the rim of one of the intervening stones, touches the side ("takes an inwick") of a second, and, shooting inwards, impinges on the object-stone, which it has actually displaced with most scientific accuracy. A *coup* so beautiful as that can be by no means very common; but it may be conceived with what frantic applause it is greeted. The chivalrous opponents, though mortified and disgusted, cannot withhold the signs of their irrepressible admiration; and their leader, who had already counted the game for his own, is growling confidentially into the folds of his comforter, "Hech, mon, but that was a most notorious shot." Such a master-stroke as that must always awaken vociferous enthusiasm; but perhaps the game as a whole is merrier when the ice is in somewhat less perfect condition. Then it requires even greater judgment as to the strength with which the stones must be played, and, of course, there is far more sweeping to be done. The men follow each successive stone in its course, dancing like so many demons. "Scoop her up, scoop her up." "Na, na, lat abee, lat abee." For everybody must have his say, or rather shout, though it is the skip who should give the actual word of com-

mand. And when the ice grows somewhat "dragged" in more or less of a thaw the labours of the game may become severe. Neck-wrappings and even coats are cast aside; strong arms are flung back to the furthest from the shoulder before the stone is delivered with a powerful effort; sometimes when a player is much overweighted the stone may even be turned over and sent trundling forward on its handle; and finally the feeble folk may be forced to withdraw altogether. But, whether the work be light and the air keen, or the air mild and the work heavy, cold and fatigue are alike forgotten when the players adjourn after a match for the merry curling supper. These jovial entertainments are marked with a white stone in the memories of quiet country-people who have but few opportunities of dissipation. The fare is as simple as it is abundant and substantial. Portentous quantities of beef and greens are despatched, to be digested by animated talk over the varied incidents of the day; by exciting recollections of famous matches in former bitter winters; by reminiscences of eminent curlers now sleeping in the neighbouring kirkyard; by songs, and jokes, and homely home-thrusts. All the time the kettle is singing cheerily on the fire, and the steaming tumblers are being replenished from the spirit-bottles, circulating steadily. With much kindly and hearty merriment, there is seldom any excess; the heads are nearly as strong as the arms, and the tone of the company is douce and discreet; and when the guests wake next morning, they are all the better for the game, and "not a hair the worse for the supper."

EDGAR POE AND NEW YORK.

THE City of New York is going to do itself the honour of erecting a memorial to Edgar Poe, the one poet of really original poetical talent whom the United States have produced. Perhaps it is the very fact contained in this sentence which has so long made Americans unjust to the memory and merits of their greatest literary champion in verse. The difference between Poe and all other American composers of verse has hitherto been so marked, and has been so much insisted on by foreign critics, that the acceptance of it seemed to imply a confession of inferiority for all the others. No doubt also the personal element, and some other elements akin to the personal, entered into the matter largely. Poe, though born in Boston, was half a Southerner and half an Englishman by race, education, and sympathies. He was all his life outside of the two great literary cliques of Boston and New York. He attacked his brother men of letters all round with ridicule, which, though it was generally very clumsy, must have been sufficiently annoying; with personalities more annoying still; and very often with perfectly just and acute criticism, which must have been most annoying of all. Although his moral delinquencies have been grossly exaggerated, he was in many ways a puzzle and a scandal to the orderly respectability of the Eastern States. In business relations, though perfectly honourable and trustworthy, he was irregular and capricious. His violent and demonstrative sensibility must have been nearly as trying to those whom he loved as his aggressive quarrelsomeness was to those whom he hated. He was not prosperous, and he lived in a community which insists that its members shall prosper, and regards it as in some way an outrage on the Bird of Freedom and the Setting Sun if they do not. When to all this was added the ingeniously malevolent mendacity of the official life which immediately after his death appeared as a preface to his works, it is perfectly easy to understand the attitude of the inhabitants of the Northern States towards Poe during the quarter of a century or so which followed his death. Literary misunderstanding and want of sympathy culminated in the remark made some five years ago by the most brilliant of living American novelists that the greatest poet, living or dead, of America wrote "very valueless verses." Even moral repulsion never got quite so far as this in its own direction, but until within a very few years a kind of Poe-myth existed which represented the author of "The Raven" as a drunken scoundrel, who would have been much more at home at the cart's tail than anywhere else.

All that, however, has been changed. In England Poe has always been rated high, both as a poet and a tale-teller, and English critical opinion still counts for something in America. In France, for which the literary men of the United States profess, if they do not feel, a still greater affection and reverence than for the mother-country, Baudelaire's wonderful translation established the tales in popularity. But neither French nor English critics for a long time troubled themselves much about the Poe-myth, except in so far as to build ingenious theories about the psychological puzzle which it seemed to propound. At last, chiefly owing to the efforts of an Englishman, Mr. Ingram, seconded by some of the poet's countrymen, the myth was approached in proper form, and shown to be a myth. Perhaps of late years there has been almost too much written about Poe's life, and he needs, like Villon, to appeal to the people from his too enthusiastic and inquisitive friends. But the labours of Mr. Ingram and others have at least solidly established a coherent history, instead of a fantastic legend. Instead of the drunken, dishonest, violent rowdy of legend, the history gives us a man very much like other men, subject to many infirmities of temper and physical constitution, abnormally sensitive, and yet hardly amiable, a persistent and honest worker, singularly unfortunate in the conditions of his work, yet struggling bravely against them, affectionate to those with whom he had most

to do, and honourable in his dealings with outsiders. An extraordinarily unhappy life Poe's certainly was, and a good deal of the unhappiness was his own fault; but, though he was somewhat wrong-headed, he was not bad-hearted, and the word "vicious" can only be applied to him by the most pharisaic disciples of Sir Wiffrid. For ourselves we confess that the fuss made about Poe's moral character seems to us to have been altogether gratuitous. But there can be little doubt that his evil reputation stood in the way of the enjoyment of his good work by some people, and no doubt at all that it stood in the way of his statue. The proposed monument, to the funds for which Mr. Edwin Booth has been a principal contributor by his professional exertions, is not indeed the first of the kind in America. For Baltimore, with which place the poet had special connexions, paid him this honour four or five years ago. But Baltimore is in no sense a metropolitan city, while New York is; nor had Maryland the same reason to make an *amende honorable* to Poe as those which ought to induce the Northern States to make it. Therefore the New York memorial, whether it take the form of a statue or of anything else, may be taken to be a kind of formal cancelling of Poe's moral attainder on the part of the United States, and a recognition of the fact that he has at last been judged on his merits, and that his merits are pronounced to be high. Their relative height we have already hinted at, and it would be ungracious to insist upon it any more at this moment.

We have, however, no doubt that, as time goes on, Poe's literary merit will be more and more, not less and less, recognized. For he was remarkable in three different ways—as a critic, a tale-teller, and a poet; and in each of these ways he had merits which are almost exclusively his own. He is indeed always unequal, and he is most unequal as a critic. It may be said deliberately that many of his scattered *dicta* exhibit an almost unparalleled acuteness of critical wit. His demonstration of the impossibility of long poems, his indication of the indefinite as an essential property of poetry, a dozen other things of the kind may be alleged in support of this. He was, moreover, a very painstaking as well as a very acute critic. Mr. Lowell has probably by this time repented his sneer at Poe's talking of "iambus and pentameters," and indeed it may be suspected that he was seduced into the sneer by some *latin* who suggested the ingenious rhyme wherewith he has accompanied it. Poe's education was certainly defective, yet he made the utmost of it in the service of his art. But, though he is often one of the most luminous, he is also one of the most untrustworthy, of critics. He was entirely devoid of humour, which is almost a necessity of the critic's equipment, and he seems to have entirely lacked what must be vaguely called taste—that is to say, the power of estimating the relative values of things. Perhaps no man of decidedly high talents ever made such a ludicrous blunder as the statement that "for one *Fouqué* there are fifty *Molières*." If he would only have indicated to us the whereabouts of the forty-nine! The truth is that Poe was positively deficient in the power of appreciating a good many things, and that he never suspected his deficiency. The romantic mystery of *Fouqué* appealed to him; the consummate knowledge of ordinary human nature, and the polished style of *Molière*, did not. This makes his criticism worthless as a guide; it makes it all the more interesting as an independent study. When he talks thus of *Molière*, of Mr. Carlyle, and of many other persons whom he did not understand, perhaps the best thing to do is to remember his unfortunate, but delightful, paper on "The Philosophy of Furniture." An honest but wholly uneducated soul, *ohne organ* of the particular kind required, here tries its hand at aesthetics. The bodily eye would involuntarily seek the shelter of its fringed curtains in Poe's awful drawing-room; but the eye of the mind, more catholic and tolerant, contemplates it with some pleasure and a good deal of instruction.

It is almost unnecessary to speak of the tales. They are not quite faultless, but they are almost without fault. In this direction Poe's hand was surest. He never, like his imitators, embroils an interesting plot only to huddle it up with an insufficient dis-embroidment. He rarely introduces a single jarring note. He very seldom over-steps—though it must be admitted that he sometimes does this—the narrow and perilously winding line which separates the sublime and horrible from the simply ludicrous and wearisome. His mere puzzle-pieces we care less for. "The Gold Bug," perhaps, is the only one which, from the vigour and animation of the narrative, deserves to rank in the first class. But "Ligeia," "The House of Usher," "The Masque of the Red Death," "The Cask of Amontillado," "The Descent into the Maelstrom"—these are all different and all perfect. They have at one time the vague and floating charm of the best German *märchen*; at another the sustained narrative interest of English story; at almost all the literary grace and careful proportion of the French *nouvelle*. Even the minor stories—always excepting the humorous ones, which for reasons given already are wholly worthless—would be masterpieces for any one else. But, indeed, the tales have so thoroughly conquered their place that that place needs little description. It is not so with the poems. Here Poe is as unequal almost as in his criticisms; as perfect occasionally as in his tales. In one particular respect it may be said that no poet has surpassed him—that is to say, in the power of setting words together so as to produce an indefinite, and indeed indelible, sensation of beauty in colour and form and sound at the same time. No one ever wrote in words a piece more thoroughly and suggestively musical than "Annabel Lee," no one has ever excelled the soft lapse of the trochees—we shall make His Excellency the American Minister "d—n metres" once more—in the

"Haunted Palace." All his strength and all his weakness may be seen in these two pieces, with "Ulalume" and "For Annie." Of the two horses which drew his poetical car, Sense and Sound, the former was terribly restive, though the latter was obedient enough, and occasionally he drives heavily. But, for the most part, the Sound is able to drag the recalcitrant Sense with it, and sometimes they keep step and time with the most marvellous harmony. Praise of Poe usually excites, in people who do not like him, a peculiar, but intelligible, feeling of irritation. It is credible, indeed certain, that the line from the "Haunted Palace"—

Banners, yellow, glorious, golden—

which is sufficient for a test examination of poetical critics, does actually strike some people possessed of a fair complement of intellectual faculties as nothing at all particular. To these persons admiration of Poe's poetry will always seem preposterous; as preposterous as admiration of Molière seemed to Poe himself. Does one incur the penalties of the Pharisee for thanking the Muses that one is able to admire both Molière and Poe? Let us hope not; and let us congratulate the inhabitants of the Empire City on having done, or rather on being about to do, a very sensible thing. The Northern States of the Union have already and quite recently produced, in Mr. Stedman's essay, the best critical examination yet published of the poet they so long undervalued; and the projected memorial fairly supplements that criticism and the biographical labours of Mr. Ingram. Poe has now got his Life, his *éloge*, and his memorial; it only remains that some one should give us a really well-printed edition of his poems, and perhaps his best tales. Mr. Ingram's edition of the works is exhaustive, but not beautiful; all the others are neither the one nor the other.

M. SARDOU ON DIVORCE.

THE Théâtre du Palais Royal was rebuilt last year during the unfortunate visit of the company to London. The operation has been performed so cleverly that, though not so much as a square inch of additional ground has actually been obtained, the theatre seems to have grown quite spacious. The old dinginess has disappeared; and, we may add with satisfaction, the old stuffiness also; the seats are comfortable, and not too close together, and the vulgar drop-scene, covered with advertisements of hats and sewing-machines, and a benignant demon offering all manner of wares at the cheapest possible rate, has been replaced by a handsome curtain. In the centre of the proscenium a particularly well-chosen motto from Rabelais has been inscribed:—"Mieux est de ris que de larmes écrire, par ce que rire est le propre de l'homme. Vivez joyeux." In exact conformity with the advice tendered in these lines, M. Victorien Sardou has supplied the first new piece, a comedy in three acts, called *Divorçons!* The title is suggestive; and, having regard to the known character of the theatre, where, provided people can be made to laugh until they can laugh no longer, authors and actors may say and do what they please, we expected a dish of exceedingly piquant fare, a sort of dramatic curry. That the author of *Dora* and *Daniel Rochat* should have stooped to this sort of work surprised us a little; but M. Sardou, though he is a member of the Academy, and, therefore, one of the privileged forty who are supposed to watch over the highest interests of French literature, is, above all things, a good mechanical playwright, and on occasion can write to order like humbler mortals. Moreover, we remembered a certain early piece of his, called *Les Hommes du Voisin*, the fun of which promised well for the mirth-exciting qualities of *Divorçons!* On that score the piece leaves nothing to be desired. We have rarely seen an audience laugh as they laughed that evening. That it was broad—very broad indeed in places, and seasoned with a salt that is not Attic—is a fact that the most indulgent critic cannot deny; but underneath the wild fun and boisterous extravagance of parts of it there lies a serious intention, which is handled so delicately and so ably as to give *Divorçons!* in our judgment, a considerable place, not only among the author's works, but among modern French comedies.

The question of divorce is one of the most burning questions of the day in France; and, though it has not as yet been brought formally before the Chamber, it may be considered as tolerably certain that it will be discussed there at no distant date. Meanwhile it has been treated at meetings and in pamphlets, and has furnished the groundwork of a dozen or more serious plays. Those who have followed the modern French stage are familiar with the advanced lady, of lofty aspirations and feeble morality, who, finding that her plain, but honest, husband is not the ideal being that her soul demands, takes refuge from domestic insufficiency in the arms of a stalwart youth, with golden, not to say "carrotty," locks, irreproachable manners, and a faultless coat. By and by the husband finds out the intrigue, and there is "an awful row," the result of which depends on the theatre at which the piece is played. Then comes the problem, What is he to do with his wife? Sometimes he shoots her then and there, which is no doubt a simple way out of the difficulty, but hardly one that could be generally adopted; sometimes they agree to separate, but then there are the children to be considered (for there is always at least one child in these pieces); and sometimes the scene is laid in Switzerland, where divorce is allowed, which gives opportunity for a pretty scene, and a good deal of sentimental talk about nature, and the nuptial knot is triumphantly untied to slow music and a distant view of

the Alps. In *Divorçons!* M. Sardou has presented the comic side of all this. The way in which he handled the civil marriage in *Daniel Rochat* showed that he can approach an important social question with becoming gravity; but that of divorce has hitherto been treated with so much priggishness, and overlaid with such a thick crust of false sentiment, that it was high time for an author of courage and talent to make the conventional presentation of it on the stage the subject of a brilliant, laughing satire.

The plain husband in M. Sardou's piece is a M. des Prunelles—short, stout, addicted to scientific and mechanical experiments, and eminently uninteresting to the outward view. He is no fool, however, as the sequel will show. His wife, Cyprienne, is the lady who, "according to custom," is yearning for the society of a being who shall comprehend her; but at the same time she is held back, as she herself laments, by an unworthy superstition that she ought to respect her plighted vows to her husband. "J'ai longtemps médité ce problème," she says, "comment respecter mes devoirs en les oubliant." Adhémar, her lover, is all that emancipated woman could desire; but there is that odious law between her and him. It must be swept away. The question of divorce is her favourite subject of study and conversation; the newest pamphlets that advocate it lie on her table, with the leaves turned down at the most important passages; and she has gathered round her a society of congenial female friends, who all think as she does, though some are neither so moral nor so circumspect as herself. There is an admirable scene between her and her husband at the beginning of the piece in which she puts the received arguments about woman's rights with a force that he, who has not always led a life that will bear close inspection, finds it difficult to answer. "You call me a 'femur délicieuse.' That is an epithet which implies comparison. Why are not we women to be allowed the same latitude as you men? 'Je veux mettre les maris en circulation. J'aurais plus de choix.'" Meanwhile Adhémar, who has no idea of waiting till the law is changed, being a young gentleman "who takes his license in the field of time," succeeds in persuading Cyprienne to grant him the usual interview at dead of night. He is to enter through the conservatory, when the household are all asleep. The husband, however, has anticipated the lovers, and, thanks to his knowledge of electricity, takes such precautions that no sooner has Adhémar closed the door behind him than every bell in the house is set ringing, and the guilty pair find themselves surrounded in a moment by their servants and their friends. We forgot to mention that Adhémar, in order to induce Cyprienne to agree to the aforesaid interview, had got a friend to send him a telegram announcing that the Chamber had voted in favour of divorce by an immense majority. In the second act, which is by far the best of the three, the husband accepts the situation thus traced out for him, though he knows, as well as Adhémar does, that the news is false. "Divorce will become the law of the land in a few months," he says. "You wish to be divorced. I have not the slightest objection. I am perfectly aware of my inferiority to this glittering creature, M. Adhémar; he shall be my successor; but I am not going to be made ridiculous. How far has all this gone?" Cyprienne, not to be outdone in frankness, minutely describes the whole affair. In a scene which is indescribably funny, and which has besides some of the highest qualities of comedy, she relates the origin and progress of her romance, and turning out her drawer of relics, tells her husband the story that is attached to each. Armed with these precious details, Des Prunelles has an interview with Adhémar, and lays down the conditions of their existence during the coming year. Presently, however, he admits to Cyprienne that he is going to dine at a restaurant in company with a certain lady. She at once becomes furiously jealous, forgets all about Adhémar, and upbraids her husband with not inviting her to any of those festive expeditions. "Will you come?" he says. The fact that the proposal directly contravenes one of the conditions determined upon with "the successor" supplies the spice of impropriety, the absence of which in simple pleasures has been frequently regretted, and Cyprienne accepts. She bids her maid tell Adhémar that she has gone to see an aunt, and hurries her husband out through the conservatory, exclaiming, "File, mon ami, file! il pourra nous rattraper!" Hardly have they gone when Adhémar enters. "Madame dine chez sa tante," says the maid. "Déjà!" he exclaims, as the curtain falls. The third act takes place in the private room of a restaurant. M. des Prunelles orders an appetizing repast, with plenty of champagne and burgundy. While Cyprienne has retired to take off her bonnet Adhémar enters in high dudgeon. He has followed Cyprienne to her aunt's apartment, to find that the aunt has been out of Paris for two months. "My dear fellow," he says to Des Prunelles, "I must put you on your guard against aunts. It's a well-known excuse, with which you ought to be made acquainted." "Ah!" replies the husband, "you have made a mistake. It was not *that* aunt, it was the other"; and he gives an address in a distant quarter of the city. Adhémar having departed to look for this apocryphal relative, Cyprienne and her husband sit down to dinner, and do ample justice to the succulent repast which obsequious waiters bring in. The result may easily be imagined. When Adhémar returns, drenched to the skin, covered with mud, and his umbrella turned inside out, he finds the pair perfectly reconciled, the lady reposing in her husband's arms, and quite satisfied that no better creature exists on the face of the earth than the partner whom she had previously despised. Furious at the sight, he completes Cyprienne's cure by making himself utterly ridiculous. He calls in the police, and demands the

arrest of Des Prunelles for abduction of the lady whom they have agreed to regard as a joint possession, and to speak of as "notre femme." The end of it, of course, is that Cyprienne sees her mistake, and in a few serious words admits as much before the curtain falls.

We have of necessity given a mere outline of the plot, and especially of that of the last act, which is broadly farcical in its details, some of which are—let us say Aristophanic—and might well be omitted, if *Divorçons!* is intended to be a permanent piece of literature; but that Cyprienne should surrender her aspirations for the emancipation of her sex under the combined influence of good cheer and conjugal endearments is only the logical conclusion to what has gone before, and is precisely what we might have expected from the flimsiness of her character. The introduction of the broader details that we have alluded to was probably thought necessary for the taste of the audiences at the Palais Royal. We can well imagine that when he began to write he thought only of amusing, and that the serious intention which seems to underlie the fun was developed afterwards, perhaps almost unconsciously. It is said, indeed, that *Divorçons!* was written as a pastime, in the intervals of the composition of a solemn oration which M. Sardon had to deliver before the Academy at the distribution of the *Prix de Vertu*, founded by M. Monthyon. Let us hope that the author was as much diverted as his audiences are.

The piece is admirably acted. Mme. Céline Chaumont, who plays the difficult part of Cyprienne, renders that lady's ridiculous enthusiasm, the midsummer madness of her extravagances, with a total absence of self-consciousness and a complete self-restraint. She knows exactly where to stop, and carefully avoids all exaggerations not specially required for the character she has to develop. She represents female enthusiasm gone mad, and nothing more. The result is a performance so irresistibly comic that the great artistic merit of it is likely to be overlooked in the hilarity that it provokes. M. Daubray is as good as she is in the far easier part of the husband. The actor who played Adhemar seemed possessed with a fatal notion that it was his mission to be funny. The small parts have all been entrusted to artists who understand the author's intention perfectly.

THE NIGHT SIDE OF NATURE.

THE non-scientific visitor who leaves the Zoological Gardens as the shades of evening are gathering over Regent's Park naturally thinks that with the closing of the gates the show is over, and animals and keepers alike retire to rest. As a matter of fact, the Gardens then present a new scene of activity, and fresh responsibilities are imposed upon the attendants. Some of the larger beasts of prey, such as the lions and tigers, have accommodated themselves to altered circumstances, and, having been on day-duty in the public service, turn in at night; elephants, who are always sensible persons, recognize that the night was made for repose; hippopotami, who have been sleeping nearly all the day, gladly avail themselves of the stillness and gloom, and take yet another forty winks; and even the monkey-house is in comparative quiet. But there are a large number of birds, animals, and reptiles who, having kept themselves in rigid seclusion during the day, issue forth in accordance with peremptory habit at night, and demand food and attention. These animals, of the greatest interest to the zoologist, are but little known to the general public, for the obvious reason that the Gardens cannot be thrown open at night, as the inmates, human and otherwise, must neither be deprived of their rest nor disturbed in their avocations. The salutary rule having been relaxed for us, we made our way as it was growing dark to the office of the Superintendent of the Gardens, Mr. Bartlett. The principal object of interest there was a lone little boy, who had been forgotten and left behind by his parents, and from whom an attendant was unsuccessfully endeavouring to elicit his address. This is a common experience at the "Zoo," the Monday visitors especially being often vague as to the number and nature of the *impedimenta* which they bring with them. The gigantic and vicious spider from the West Indies, which feeds on cock-roaches, was also housed there out of the cold; while on the branch of a tree, fixed up in the room adjoining, sat what was apparently a tame, fluffy miniature bear, eating dry leaves. This was the so-called climbing bear (Koala) of Australia, which is really a marsupial. Hundreds have been brought to this country, but hitherto the animal has never lived in captivity; and, although a boy is kept to pet it, and eucalyptus, or blue gum, leaves are brought from Kew and from Marseilles to feed it, the future of the present specimen is a source of great anxiety to the authorities: if, indeed, it has not already succumbed to the climate. The inmates of the Gardens require, as might be expected, constant attention, and night brings but little relief to the keepers. Many of those which are nocturnal in their habits can only be fed and attended to by night, while others must on no account be approached after dark. Even the docile elephant, the sleepy, stupid-looking hippopotamus, and the solemn rhinoceros become raging beasts if disturbed by the presence of a light. The elephant-house has furnished Mr. Bartlett with several patients on which to exercise his surgical skill. One of the Indian elephants some time since had the misfortune to wrench off a portion of its trunk which had got caught in a noose of rope, and the largest African specimen, whose huge proportions are well known to the

frequenters of the Gardens, met with an accident by which its tusks were broken off; the stumps subsequently grew into the cheeks, causing it excruciating pain, and necessitating an immediate remedy. The intrepid Superintendent undertook to perform the delicate operation and relieve the poor beast. Having prepared a gigantic hook-shaped lancet, he bandaged the creature's eyes and proceeded to his task. It was an anxious moment, for there was absolutely nothing to prevent the animal killing his medical attendants upon the spot, and to rely upon the common sense and good nature of a creature weighing many tons and suffering from facial abscesses and neuralgia argues, to say the least of it, the possession of considerable nerve. But Mr. Bartlett did not hesitate, and climbing up within reach of his patient he lanced the swollen cheek. His courage was rewarded, for the beast at once perceived that the proceedings were for his good, and submitted quietly. The next morning when they came to operate upon the other side, the elephant turned his cheek without being bidden, and endured the second incision without a groan. Another of Mr. Bartlett's exploits, the extraction of a hippopotamus's tooth, has been already related by the late Mr. Frank Buckland in his admirable *Curiosities of Natural History*. The Gardens have indeed a high reputation for the performance of animal dentistry. Certain Indian conjurers who some time since appeared in London brought over a number of cobras with them. It is instructive to those who investigate the subject of the snake-charmers of India, and consoling to the visitors to the Aquarium, to know that the *thaumatophidia* in question had their poison-fangs extracted at the Zoological Gardens shortly after their arrival. Cobras, however, are "kittle cattle to fash," and one of the keepers who incautiously took out a specimen paid for his rashness with his life. The authorities at the Gardens, practical as they are, know of no sure cure for snake bites; in cases where the sufferer does recover, it is by no means certain that he has been thoroughly poisoned, for a person may be wounded by a snake which has recently lost or expended the contents of its poison fang before the creature has had the time to secrete more, and will not of course be exposed to anything like the risk. One of the keepers in the Dublin Gardens being intoxicated, and having in that condition irritated the boa-constrictor, was bitten by the animal, and died in three days of blood-poisoning and shock to the nervous system. It is a moot point with those best acquainted with serpents whether even those most generally supposed to be harmless have not some power of secreting poison. Certainly the same glands exist in both the venomous and harmless species, and the moral would seem to be that snakes, like "Injuns, is poison wherever found."

But in a little compartment of the Ostrich House resided the principal object of our visit, that quaintest and most uncanny of birds, the Apteryx, or Kiwi-Kiwi, which was long thought by naturalists to be a mythical creature. It never comes out at all but at night, and even then, on this occasion, he had perceived our approach, and taken up his usual place of concealment among the straw. It is a round little nondescript with a long curved beak, no tail, the merest rudiments of wings, which are not visible through the plumage, and large powerful feet, with which it kicks in a very formidable manner, while it can, by striking them on the ground, make a tremendous noise quite disproportionate to its size. It lives chiefly on worms, and having its nostrils set at the very tip of the beak, can pry them out in its nocturnal rambles without the aid of eyes. Having discovered the whereabouts of a worm, it is said to entice them to the surface by stamping on the ground; we cannot vouch for this as a fact, and must confess that, if we were a worm, we should be anything but allured by such a burglarious clatter overhead. The most curious circumstance perhaps about the Apteryx is its egg, which is nearly as large as the parent bird, and is one-fourth of its weight. Several have been laid in the gardens of the Society by the present specimen, thus settling at rest all doubt upon the subject. It is a native of New Zealand, where it is now becoming very rare, and is closely allied to the Moa, or Dinornis, which is now extinct, but which, if we are to believe native accounts, existed within the last hundred years. The skeleton of the last-named extraordinary bird is by this time familiar to the frequenter of museums of comparative anatomy, and from its gigantic proportions recalls the fabled Roc of the *Arabian Nights*.

As there are no indigenous mammals in New Zealand, and man, being an omnivorous animal, is constrained occasionally to vary his diet of grain, vegetables and fish, the disappearance of these large fowl may easily be accounted for; but the prevalence amongst the Maori race of a taste for "long pig," as they euphemistically term man when used for edible purposes, would seem to argue that the supply of Moas must have failed some long time ago. The introduction of domestic animals on the island has done much to improve the moral tone of the natives, and makes it at length possible for a missionary to contemplate the possession of a healthy *embonpoint* with composure.

Amongst the other nocturnal creatures to which we were introduced were an Aard wolf, which is really a sort of hyena; the great ant-eater, with his magnificent bushy tail and ridiculous carrot-shaped head; a little sloth bear, which strenuously resented being taken away from his dinner to be hauded round for inspection, and several specimens of the Phalanger tribe. The Society's collection is rich in these and other marsupials, their kangaroos especially furnishing most interesting studies for the habits of such creatures. The kangaroo is born like any other mammal, but not fully developed, and its mother at once puts it in the pouch. Several females of this species have been closely watched, but the exact

moment and manner of depositing the young in this receptacle has not yet been observed. When they are old enough the mother throws them out of her pocket and leaves them to provide for themselves. So little penetration, however, does a kangaroo seem to possess, that one in the Gardens carried about a young monkey for some time under the impression that it was her own offspring, and occasioned the attendants considerable amusement by her air of surprise when her supposititious child put out his hand and stole the biscuits which were offered her.

The great ant-eater, mild as he looks, can be very troublesome at times; on one evening he had had his bath, of which he is inordinately fond, and refused to come out. The attendants remonstrated with a chair and a broomstick, when he stood on his hind legs, fought with his strong claws, and roared like a bear. Bears, by the way, are also a treacherous folk, and the keepers place but little faith in them, however tame they are reported to be. Three men have already been killed by these animals in the Gardens, and it is to be hoped that no one will have to repeat the hazardous feat of the gentleman who some time ago descended into the bear-pit to rescue a child which had fallen in, and brought up his charge unhurt. It is not always that beasts are so astonished as on this occasion, or so occupied with their own private disputes, as in the more memorable incident related by Schiller in his "Ballad of the Glove," as to allow an intruder to leave them scot free. One of the largest bears in the Gardens was the property of a Savoyard couple, who took it about performing in the street. The police, rightly deeming that so large an animal with so little restraint was dangerous, naturally objected, and the green-yard offering no facilities for his detention, Bruin was brought for refuge to the Gardens. The magistrates refused to allow the exhibition to continue, and it remained in the Gardens, a smaller bear being given in exchange. The lion "Wallace," who a few days ago nearly killed its keeper at Birmingham, is also to retire from public performances to the *otium cum dignitate* of the "Zoo." We are constantly being reminded by these and still more tragic accidents of the barbarity of allowing "Lion-taming" to continue in existence. Only last week a tiger in a show at Philadelphia killed his keeper before the audience. A well-directed revolver shot from one of the bystanders slew the beast, and enabled the attendants to draw out the mangled corpse of the Lion King, when the second tiger fell upon its prostrate mate tooth and claw, and the spectacle became so ghastly that the crowd beat a precipitate retreat. There is a vast difference between these debasing entertainments and the keeping of animals under such circumstances as in the Zoological Society's collection, where they are not only well cared for and happy, but where they afford great opportunities for scientific research and afford harmless amusement to thousands.

The crowds of mere holiday-makers who daily crowd the Gardens, when frost and snow have not hermetically sealed every out-of-door place of amusement, cannot be expected to realize the amount of patience, money, and skill required to satisfy the wants and restrain the caprices of so large a collection of animals of such widely different habits and requirements, and nothing better proves the competence of the Zoological Society's staff to carry out the task than a glimpse at the night side of nature at their establishment.

THE FALL IN SILVER.

THERE has been another fall in silver of late, and, although the price has somewhat recovered, there are very general apprehensions that the recovery will not be lasting, and that we are on the eve of a further and a very heavy fall. The decline, so far, has not been considerable. Having oscillated about 52 pence per ounce for a year or two, the price dropped some weeks ago to about 50 pence, and is now over half-way between those two quotations; but the market is not steady. Those who take a gloomy view of the future argue that Germany has now, for a long time, discontinued the sales of silver; that under the Bland Act the United States have been coining silver at the rate of 400,000*l.* a month; that there have been no further demonetizations of the metal; and yet that the price has not risen much above 52 pence, being a permanent depreciation of about 13 per cent. They urge further that now India has been taking less silver than of old; that there are rumours that Germany intends to begin selling again; that the United States Government is unable to get the silver dollars into circulation, and is consequently urging upon Congress the necessity of some alteration, and that it is evidently disposed to stop further coinage; and, lastly, that Italy, about to resume specie payments, intends doing so in gold, and not in silver, as had been expected. They conclude that the result is certain to be a very heavy fall in the value of the metal, which will probably induce further demonetization, and that, in its turn, further depreciation. This argument, it will be seen, rests partly upon fact and partly upon conjecture or rumour. Let us, before proceeding to consider its merely speculative part, inquire how far it is really supported by the facts.

The important point to notice is that, since the stoppage of the German sales of silver, the price of the metal has been pretty constant until quite lately, when several circumstances—of which the most important is the falling off in the exports to India—have caused a decline. India is essentially a country which exports more produce than she imports. The ideally perfect state of the

foreign trade of a country would be that in which the imports and the exports would balance one another. In such a State scarcely any money would pass between the country and its foreign customers, the goods one way paying for the goods the other way. But owing to the extreme poverty of the population of India, that country is able to buy much less than it sells. The consequence is that, in addition to the imports of goods, there has to be an import of specie to pay for the exports. For several years past the imports have consisted of commodities, of India Council bills, and of silver. Quite recently there has been an increase in the imports of commodities, and there has also been an increase in the India Council bills. The India Council bills consist partly of the price of commodities—as, for example, the materials for railway building—partly also of the interest upon debt, payable in this country, and partly of salaries and pensions due to Indian officials here at home. Every increase in these bills of course displaces a certain amount of silver, which would have to be sent if they had not existed; for it is more convenient for a person who wants to make a payment in India to buy one of those bills, which are neither more nor less than orders upon the Indian Treasury to pay a specified sum of money, and transmit the bill to the person to whom the payment is due. But, in addition to the increase in the India Council bills, there has been an increase in the imports of commodities. During the recent terrible famine, the people were unable to buy clothing as usual; but as soon as the famine passed away, and they found themselves once more in funds, they began to purchase more largely, so as to replenish their wardrobes. The consequence has been an extraordinary increase in the exports of cotton goods from this country. There can be no doubt, of course, that it is more advantageous that India should take cotton goods than that she should take silver, as it gives employment both to the capital and labour of Lancashire. Still, the larger import of cotton goods diminishes the import of silver, and consequently tends to reduce the price; but this exceptional augmentation in the imports of cotton goods can hardly be expected to continue. After a while the cotton market in India will be fully supplied, if not more than supplied; and then an increase will take place in the remittances of silver. We are not inclined, therefore, to regard this falling off in the demand for silver for India as a permanent, or even a serious, cause of depreciation.

Nor do we think that the rumours or reports of intended changes in other countries are deserving of much more consideration. No one can tell, of course, what the German Government intends to do. It may resume its sales of silver, it may adopt the double standard, or it may call in the old silver and re-coin the greater part of it as subsidiary or token coinage; but, so far, nothing certain is known of the matter beyond the fact that, for the present, the sales of silver are suspended. Even, however, if it should begin to sell again, we do not think that the permanent effect upon the market would be as great as is supposed. At the very outside, the whole amount to be disposed of does not exceed 17,000,000*l.*, and a large proportion of this sum will be required as additional token coinage. Probably, therefore, 12,000,000*l.* is the very outside amount to be sold. But India alone has often taken that much in a single year, and if any sudden cause stimulating the demand for silver for that country should arise, the sum would be disposed of in a very short time. As for the reports of the Secretary of the Treasury of the United States and of the Controller of the Currency, it is to be borne in mind that these gentlemen have from the first been opposed to the Bland Act; that each year since it was passed they have been pointing out its mischievous effects; and that there is no more reason to suppose their recommendations will be attended to now than at any time since the Act was first placed on the statute book. It is true, indeed, that at the late elections the Republican party was successful, and that a Republican Administration will be more likely to carry its way with a Republican Congress than with a Democratic one. But, on the other hand, it is not to be forgotten that silver mining is a very important industry in the United States, and that the desire to protect native industry in all its forms has as yet lost none of its force, and, in fact, is stronger with Republicans than with Democrats. The silver party was powerful enough to have the Bland Act, and it may be trusted to oppose a very stubborn resistance to any proposal to repeal that measure. In any case, an early repeal is improbable. Congress will be more likely at first to recommend another conference with the European Powers, so as to see whether longer experience may not have induced Continental nations, if not England, to agree to some bi-metallist plan. Lastly, as regards the intention of Italy to resume specie payments in gold, we have to see whether she will be able to give effect to her intention. It is said that the Messrs. Rothschild have declined to bring out the loan necessary for resumption on the very ground that it would be impossible to get for Italy the gold she requires, and that the negotiations are in consequence going on on another basis. Whether the report be true or not, it is certain that it would be very difficult for Italy to obtain the gold she would require. England, France, and Germany would all take measures to protect their gold reserves, and Italy would thus be compelled either to pay an extravagant price or see her plans defeated at the very outset. It is only reasonable to assume that Italian statesmen who have shown themselves practical and sound will recognize that it would be an unwise course to adopt a gold currency, and, while remaining within the Latin Union, and therefore nominally maintaining a double standard, will really adopt a

silver currency. For Italy herself that would be the most advantageous course. The country is poor, and the incomes of her people are small. The mass of the transactions are in small sums, and silver would therefore be much more convenient for all exchange purposes than gold would be. Nor, even in international transactions, would there be any advantage in a gold standard. The purely silver countries have no real difficulty in settling their debts abroad.

It has been acutely pointed out by a writer in the *Statist* that perhaps the most potent cause in the fall of which we are speaking is one that has been scarcely noticed hitherto—namely, the increase in the value of money, to which we referred last week. Although silver is money in the silver-using countries, here in England it is only a commodity; and, like other commodities, its price tends to fall with every rise in the value of money, unless, indeed, there is a contemporaneous rise in the value of money in the silver-using countries. It would not seem, however, that there is such a rise at present; and naturally, therefore, silver tends to fall as gold tends to rise. If, as is generally expected, money is to become dearer for the next year or two, it is quite probable that the downward tendency in the price of silver may continue, unless the improvement in trade extends to the East, and money there also becomes dearer. Undoubtedly there has been a considerable improvement in Eastern trade. The disappearance of famine, to which we referred above, of itself is an enormous stimulus to trade. Still the improvement has not been of a character that would greatly enhance the value of money, and apparently there is no very marked alteration in the Indian money market; but, unless the country is visited by famine again, the progress of improvement will naturally bring about an increase in the value of money, and then silver will tend to rise, just as gold is tending to rise with ourselves.

ENGLISH MASTERS AT BURLINGTON HOUSE.

PORTRAITURE holds, as usual, a dominant place in the representation of the English school at Burlington House. The few artists of the last century who strove to establish in England a tradition of monumental design are rarely to be met in these annual gatherings of Old Masters, nor is their absence much to be deplored. We can more easily do justice to the aims of men like Barry, West, and Fuseli when we are not burdened with the heavy duty of examining the actual results of their labours. Barry, at least, worked with a noble ambition and in a spirit of the truest devotion to his calling; but both he and others who strove to introduce into painting an element of ideal beauty were carried away by a sentiment of extravagant hostility to the accepted modes of artistic practice. Nothing is more remarkable in the laboured inventions of these men than the total absence of those qualities which give such enduring charm to contemporary work in portrait. It would almost appear as though they had deliberately excluded from their view whatever the portrait-painter found worthy of his study. All suggestion of individual character is rigidly suppressed in obedience to a preconceived theory of the requirements of classic style, and forms and faces alike are reduced to a dull abstraction that scarcely keeps any sense of contact with living humanity. The contrast offered by these opposite schools of painting is indeed at first sight so striking and extraordinary, that it is difficult to realize that they belong to a single epoch. And yet the failure of nearly all attempts at imaginative art was as profoundly characteristic of the eighteenth century as was the brilliant success achieved in portraiture. A fine enjoyment of the realities of social life, with a corresponding keenness of appreciation for the most delicate distinctions of individual character, mark the literature no less than the art of the time, and whatever in either field strives for a higher reward is for the most part found to be infected by a pedantic devotion to classic models.

It is necessary to keep in mind these unfavourable influences against which all the higher forms of inventive art had to struggle in order to appreciate at its just value the genius of an artist like Flaxman, whose collected drawings occupy a gallery to themselves. Flaxman was endowed with the highest powers of design, and by the strength of his original gift he was saved from the failure that others had to confess. And yet it is not possible to examine any large number of Flaxman's drawings without being somewhat oppressed by the monotonous character of the forms and faces, and by the imperfect sense of humanity which mars the effect of his more elaborate compositions. That this, however, is the result rather of deliberate theory than of any lack of individual strength is sufficiently proved by the direct studies from nature which form so large a part of the splendid contribution from University College. By their help we may perceive how thoroughly Flaxman understood the true sources of beauty in abstract design, and if the finished performance does not always satisfy the promise of these simple studies, it is at any rate in all cases the result of a legitimate process of selection. Flaxman's elegant and balanced compositions are thus entirely free from the deformities and exaggerations which so often disfigure the ideal paintings of the time. He worked with ample knowledge, and with a cunning and practised hand, and his designs are therefore to be accepted as the most complete and satisfactory expression of the classical sentiment which inspired them. That sentiment, however, cannot be said to be so intimately related to the true

spirit of Greek art as was believed by those who laboured under its influence. Each age, as it inevitably recurs to the example of classic style, will produce of that style its own characteristic translation. The somewhat pedantic criticism of the time had established for the eighteenth century its particular conception of the beauty of Greek art, and of this conception Flaxman is the most accomplished exponent. But even those to whom its subdued and limited vitality offers no special charm will still find in these studies by Flaxman ample evidence of the greatness of his genius. Such students will be attracted less by the formal grace of the illustrations to Homer and Hesiod than by the artist's quick recognition of beauty in the ordinary incidents of domestic life shown in numerous groups of mothers and children represented in the ordinary costume of the time.

It is a sudden leap which takes us from the scholarly designs of Flaxman to the moral satire of Hogarth, and the still more homely pathos of Morland. Hogarth had struck the first note of original invention in English art; and, although his work affected none of the higher graces of style that other men sought to win, it appeals to us now as a strong and genuine product of the time. The liberty which he allowed himself in the presentation of vice and folly was rendered acceptable to his generation by the strongly didactic sentiment which flavoured all his work. In this respect he is to be distinguished from the Dutchmen of the preceding century, with whom in other matters he claims a close alliance. Like them, he was attracted by the common realities of life, choosing to interpret the facts that lay close at hand without any misgiving as to their insufficient dignity for the purposes of art. But, while the Dutchmen laboured in the broader spirit of comedy, Hogarth brought to these vulgar scenes the fierce temper of the professed moralist; and, with this special purpose in view, he was apt sometimes to lay deliberate emphasis upon the coarser incidents in his pictures in order the more strongly to enforce the lesson he had to teach. If we compare the one example of Hogarth in the exhibition—the telling composition entitled “The Lady's Last Stake” (55)—with the splendid Jan Steen from the Hope collection, we shall be glad to realize the full measure of the distinction to which we have referred. The merest glance at the Englishman's spirited design suffices to interpret his meaning. “The story I pitched upon,” writes Hogarth, “was of a young and virtuous married lady, who, by playing at cards with an officer, loses her money, watch, and jewels; the moment when he offers them back in return for her honour, and she is wavering at his suit, was my point of time.” All this is told as plainly upon the canvas as in the artist's own words, and is told in a way which shows that the interest of the story to Hogarth lay in the occasion it offered for the enforcement of an obvious moral. The picture by Jan Steen which, in the catalogue, is discreetly entitled “A Lady offering Wine to a Gentleman” (104), has a more sinister meaning more subtly expressed. The painter has been content to remain a quiet spectator of the intrigue which he has chosen to illustrate, and has given no loud hint of his meaning. His mode of interpreting the little drama that is in progress is, indeed, so subdued and restrained, that the significance of the picture has been wholly misunderstood. The critic of the *Times* accepts “The Glutton” as an appropriate title for the design; but it is not very difficult to perceive that the feast which the poor victim is enjoying is only an incident in the sure process of his ruin. The figure of Fortune with her foot upon a die which stands above the mantelpiece, the suggestive inscription carved below it, and the group in an inner apartment gambling at a table, sufficiently indicate the character of the house, while as for the actors in the play they have their characters stamped upon their faces. The old hag who kneels to the left, the youthful woman, with her over-modest air, who hands the wine, and the swaggering bully at the back of the scene; these, if we mistake not, are familiar types only not instantly recognizable because the painter has been at no pains to exaggerate the distinguishing traits of each for the sake of pointing a common moral. To what lengths of sentimental extravagance the didactic spirit may be pushed in weaker hands than those of Hogarth is to be learned from the series of designs by Morland illustrating the progress of “Letitia” from innocence to depravity. Morland was a painter of real talent, but he is here to be seen at his worst. More satisfactory specimens of his art are the Landscape (10), lent by Mr. Ames, and the “Night Scene, with Horsemen grouped around an inn door” (24), from the collection of Mr. Stanley Boulter. The few remaining examples of English painting outside the range of portrait and landscape are not of much interest or importance. The “Cricket Match” (6), by Francis Hayman, is curious rather than admirable, nor is Stothard's illustration to the *Faerie Queen* (52) a very remarkable or characteristic performance.

The great English portrait-painters are, as is usual in these exhibitions, amply and brilliantly represented. As often before, the spectator is again impressed by the larger and more varied grasp of character possessed by Reynolds as compared with his great rival Gainsborough; and yet, at the same time, he will be forced to admit that in moments of happiest inspiration Gainsborough could produce work of unapproachable excellence and beauty. The one rarely failed; the other, it is true, did not always succeed, but his successes were of a kind to far outweigh his failures. We may instance in the present collection three pictures by Gainsborough that would of themselves serve to make the reputation of any lesser artist. It would be difficult to surpass the graceful composition of “The Wood Gatherers” (172), lent

by Lord Carnarvon, though the painting here and there has suffered grievously. On the same wall hangs a full-length portrait of the Countess Ligonier (177), with a face of extraordinary vivacity and fascination, and in the first room is to be found a head of Miss Tryon, at the age of fifteen (38), where, apart from the convincing truth of the portrait, we may note the purely artistic qualities of a delicate scheme of colouring admirably worked out in tones of pink and grey. The works of Sir Joshua are on this occasion more numerous than those of Gainsborough. The fatal imprudence of the painter in the use of fleeting and destructive pigments is unfortunately only too evident in some of the best of the works from his hand. A richly coloured composition of a "Nymph, with Pan piping to her" (35), is cracked and scarred as though it had passed through a furnace. As a companion to this hangs the delightful group of "Master Angerstein and his sister Julia" (30), and in the large room, among several other contributions, we may distinguish in particular the portrait of "Lady Elizabeth Herbert, with her Child" (180).

THE THEATRES.

MR. BOOTH'S performance of Iago, a part which he is playing on alternate nights with Othello at the Princess's Theatre, fully justifies the high estimation in which it has been held by the best American critics. It is indeed a representation full of insight, grace, and force. The actor's Hamlet gave sufficient warrant that his Iago would be a carefully thought out and consistent piece of acting, executed with complete skill; and from his Hamlet, as well as from his other performances, it might have been safely predicted that Mr. Booth would not be wanting in force when it seemed good to him to indicate force. Nor could an actor of so much accomplishment and imaginative power as Mr. Booth possesses fall into any common mistake about the rendering of such a part as Iago. No known performance of any actor, however, can give the exact measure of what his success may be in a part in which he has not yet been seen. Broadly speaking, it may be said that Mr. Booth's success in Iago is complete. There are points, as there are points in every piece of acting, to which exception may be taken by individual judgment, but, on the whole, it can hardly be doubted that Mr. Booth's Iago will add materially to the high reputation which he had already attained with English critics and playgoers. In a general way, with of course some differences due to Mr. Booth's being an actor who thinks for himself, the American player's Iago corresponds to Hazlitt's description of that presented by Edmund Kean. He seems "a gay, light-hearted monster, a careless, cordial, comfortable villain. The preservation of character was so complete, the air and manner were so much of a piece throughout, that the part seemed more like a detached scene or single trait, and of shorter duration than it usually does. The ease, familiarity, and tone of nature with which the text was delivered, were quite equal to anything we have seen in the best comic acting. . . . The odiousness of the character was, in fact, in some measure, glossed over by the extreme grace, alacrity, and rapidity of the execution." Further than this, the parallel between the two actors seems to hold with less exactitude. Hazlitt goes on to complain with some diffidence of Kean's Iago not being grave enough, and Mr. Booth's Iago is certainly, at the judiciously rare moments when he drops his mask to the audience, grave and even terrible enough to satisfy any critic. One of the most impressive of these moments is found in a silent piece of acting in the scene of Roderigo's death. Cassio, wounded in the dark by Iago, has sunk on his knee. Iago, sword in hand, having seen to Roderigo's despatch, comes stealthily behind Cassio, and for a moment lets all the devilry of his nature appear in his face as he prepares to rid himself of Cassio also. Then his quick senses discern the approach of help, his sword appears raised to defend the victims against further possible attacks, and he is again "honest Iago," overcome with horror at the murder which he has been too late to prevent. This is admirably conceived, and is executed with admirable rapidity and closeness. Later on than the passage which we have quoted, Hazlitt gives a disquisition on his own conception of Iago's character, with most of which we are inclined to agree, and with most of which Mr. Booth's conception seems to fall in. For the sake of convenience we run together the passages which illustrate this conception, omitting some which dwell on points which Hazlitt thought faulty in Kean's performance and which do not appear in Mr. Booth's, and some to which we may presently recur. "Iago is an extreme instance . . . of diseased intellectual activity, with an almost perfect indifference to moral good or evil, or rather with a preference of the latter, because it falls more in with his favourite propensity, gives greater zest to his thoughts, and scope to his actions. . . . The general groundwork of the character, as it appears to us, is not absolute malignity, but a want of moral principle, or an indifference to the real consequences of the actions which the modding perversity of his disposition and love of immediate excitement lead him to commit. He is an amateur of tragedy in real life; and instead of exercising his ingenuity on imaginary characters or forgotten incidents, he takes the bolder and more desperate course of getting up his plot at home, casts the principal parts among his nearest friends and connexions, and rehearses it in downright earnest with steady nerves and unabated resolution. The character is a com-

plete abstraction of the intellectual from the moral being; or, in other words, consists in an absorption of every common feeling in the virulence of his understanding, the deliberate wilfulness of his purposes, and in his restless, untameable, love of mischievous contrivance." Mr. Booth's Iago bears throughout the impress of this "abstraction of the intellectual from the moral being"; a number of fine touches combine to convey the notion that he is always more amused with his own thoughts as to the probable result of exciting events than he is with the events themselves, even though he has brought them about. He seems, too, to take delight in the skill and readiness with which he moulds himself to whatever company he is found in. With Roderigo he is the brilliant and experienced man of the world, who knows the hollowness of things; with Cassio he is the "excellent good fellow and lively bottle-companion" that Kean, according to Hazlitt, seemed too constantly throughout the piece; and with Othello he is the thoughtful, observant, and devoted follower, whose honesty ever outweighs his inclinations. Speaking of this honesty Hazlitt observes, "He is repeatedly called 'honest Iago,' which looks as if there were something suspicious in his appearance, which admitted a different construction." This remark strikes us as purely fantastical, and we are, on the contrary, disposed to think that Iago might very reasonably and consistently be played throughout, except in the soliloquies, with that bluff, vigorous, and off-hand manner which is always supposed to be allied, and no doubt in many cases is actually allied, with honesty. Such a representation, however, would of necessity miss the constantly-changing interest, grace, and vivacity of Mr. Booth's performance.

In a performance which is for the most part of the highest merit, some points dwell especially upon the memory. Of these we may take first that one in which Mr. Booth disappointed our expectations. This was in the well-known lines

And, by how much she strives to do him good,
She shall undo her credit with the Moor,
So will I turn her virtue into pitch;
And out of her own goodness make the net
That shall enmesh them all.

Mr. Booth's action at this point was, as throughout the play, full of grace, combined with meaning and force; but his tones and expression seemed to us to miss the exultation of the man who has just thought out his villainous scheme, and who delights as much in his own power of so thinking it out as in the probable success of the scheme itself. The thing was, purposely perhaps, too much subdued; it seemed as if Iago feared the interruption which, it is true, follows pat upon the words. But, as we take it, the speech has no suggestion of this caution; it works up through swift degrees of increasing invention and delight to the triumph of a perfected plot. For the rest, it remains only to call attention to those touches in the performance which struck us as being particularly fine, and first in natural order among these comes the "I am not what I am," spoken to Roderigo in the first scene. These few words seemed to carry with them, beyond their obvious and direct meaning, a sense of pleasure in the mystifying and misleading to his ruin of the fool whom Iago makes his purse. The cynicism of the following speeches delivered to Brabantio from a hiding-place under his balcony was quiet and demoniacal, while in the soliloquy which closes the act the spectator was for the first time let into the meaning of Iago's character and the working of his mind. Here, as elsewhere, Mr. Booth marked with fine effect the youth (Iago is twenty-eight, according to his own showing) and impetus of the character, and here also he seemed to indicate that the notion of Emilia's infidelity is in the first instance merely an excuse for his own villany, with which Iago amuses himself, and which he deliberately employs to whet his purpose, while later on he is so carried away by his own inventions that he gravely affects to himself a belief in Othello's and Cassio's criminality with Emilia, and from this affected belief works himself into a true passion of revengeful hatred. Other fine points may be noted in the actor's delivery of the rhyming couplets ending with "to suckle fools and chronicle small beer"; in his intonation of "For Michael Cassio, I dare be sworn—I think that he is honest"; and in his silent hatred of Emilia in the second scene of the fourth act; and others might be multiplied upon these. Throughout the play Mr. Booth's technical skill is observable, and not least in the drinking scene with Cassio. The stage management is excellent, but the manner of curtailing the play is far from happy. It seems that at the first representations the scene between Othello and Iago was played in the same open space in which Othello's arrival in Cyprus is seen. This was clearly a mistake. By an odd coincidence the scene now employed corresponds almost exactly with the background for the same scene given by Ruhl in the plates to *Othello*, which are preserved in, among other places, the curious volumes called *Le Monde Dramatique*, to which we referred not long ago. Mrs. Herman Vezin's Emilia, and Mr. Ryder's Brabantio, are excellent performances, and the same epithet may be applied to Mr. Charles's Roderigo. Mr. Edmund has some not unhappy notions in Cassio's drunken scene; but these are completely marred by the same manner which he assumes throughout the piece—a manner which might sit well enough upon Lantier in *L'Assommoir*, but which is more than absurd when given to "a great arithmetician" who held a post of the highest honour under Othello. To Miss Milton's Desdemona it would be difficult to give praise. On the other hand, Mr. Forrester's Othello is a performance of much credit. Of Mr. Booth's Othello we may hope to speak on a future occasion.

The English and American stages have suffered a marked loss by the death of Mr. Sothern, a comedian whose great success in a part invented by himself stood in the way of his wider field of exceptional talent obtaining, in England at least, the full recognition which it deserved. Mr. Sothern's first actual appearance on the stage took place, if we remember rightly, in the Channel Islands; but, however this may be, his theatrical career may be said to have practically begun in America. The first real appreciation of his powers there was accorded to him in a line of character which in the height of his success he comparatively seldom undertook. The actor who was playing Armand in a version of the sickly *Dame aux Camélias* of the younger Dumas fell suddenly ill, and there was a difficulty about filling the part. Mr. Sothern knew the part, and played it with marked success. It was after this that he consented, under certain conditions, to play Lord Dundreary in Mr. Tom Taylor's *American Cousin*. The part was (according to a volume published in America concerning Mr. Sothern's career) in the original play an old man's part of about forty lines. What Mr. Sothern finally made of it we need not remind our readers. Of the difficulties thrown in the way of his artistic career by Mr. Sothern's exceptional success in Lord Dundreary we have often spoken, and we need now only reiterate our conviction that it was only an unhappy combination of accidents that prevented one of his latest performances on the London stage of a "character-part" from taking as high rank as, or in some ways an even higher rank, than Lord Dundreary. On the attractive ease and grace of manner, which belonged to him in public as in private life, and on the unforced indication of pathos which with these Mr. Sothern brought to bear upon David Garrick, and parts of a lighter kind of high comedy, it is needless to dwell. Looking back upon his theatrical career one can only regret that, while he did in certain and important ways so much for the stage, circumstances prevented him from giving scope to powers which were more versatile than the bulk of his admirers suspected.

In consequence of the lamented death of Mrs. Ateman the management of Sadler's Wells Theatre has passed into the hands of her daughter, Miss Isabel Bateman, whose efforts will surely be encouraged and supported by the same public which so fully recognized Mrs. Bateman's energy in providing them with good and wholesome dramatic entertainment.

REVIEWS.

THE PYRENEES.*

MR. BLACKBURN, well known as he is for possessing a pleasant knack of discomfiting about scenery, devoted his talent to a good object when he took up his pen to remind the exhausted denizens of London that the Alps were not the only playground of Europe. The propensity of tourists to move gregariously has seldom been more conspicuously shown than in the ignorance so prevalent in England that in the Pyrenees the grandeur and the grace of mountain forms may be found by those who care to seek. We wish that Mr. Blackburn's book, of which a new edition has just appeared, could have been issued with a title more accurately indicative of its scope. *The Pyrenees* seems to promise a description of that whole tract which unrolls itself in Spain as well as in France for two hundred and sixty miles; on the other hand, the second title, "A Description of Summer Life at French Watering-Places," appears to exclude that element of scenery which makes up much of the volume. Moreover, the choice provokes an inevitable comparison with M. Taine's brilliant *Les Pyrénées*. The framework of the English book is the quaint idea that the writer had applied himself to the study of that Parisian catchpenny, the *Moniteur des eaux*, with which, as summer comes on, the bored flâneur is taught how to lavish his hoarded napoleons. Mr. Blackburn turns in this valuable journal to the heading of "Pyrenees," and "under this title we find special mention made of Pau, Eaux-Chaudes, Eaux-Bonnes, Gouterets, Gavarnie, Luz, St.-Sauveur, Barèges, Bagnères de Bigorre, Luchon, and Biarritz, &c.;" to these places accordingly he bends his steps, and to the illustration of their humours and of their scenery his description is chiefly, though not exclusively, confined.

After all, the speciality of the volume must be sought in Doré's numerous illustrations. The sketches of scenery are clever—sometimes striking—but not exempt from the dashing artist's characteristic contempt for detail, and they fail accordingly in reproducing local effect. Many of them look like studies for glades in the Wood of Brancelionde, while not infrequently they are so dark as to be with difficulty deciphered. The caricature jottings often remind us of Doyle's immortal Brown, Jones, and Robinson, though far inferior in humour to that exquisite production. But more than one of them might well have been spared to give space for more solid letter-press. What, for instance, is the wit of "Invalids taking the waters"—namely, a string of about a hundred umbrellas shown upon an inclined plane, with no accessory to indicate whether the crowd concealed under their friendly shade were trooping into Covent Garden Theatre or some Pyrenean spring?

* *The Pyrenees: a Description of Summer Life at French Watering-Places.* By Henry Blackburn. New Edition, with One Hundred Illustrations by Gustave Doré. London: Sampson Low & Co. 1882.

The double character of the illustrations reproduces itself in the letter-press, not much, we think, to the advantage of the volume. So long as Mr. Blackburn is describing the natural features of the country he is on his own ground, and gives us matter which repays the perusal. But the gossiping pages over the social humours of the watering-places are pale and tedious; they are devoid of genuine humour and visibly destitute of originality. The phrase which escapes Mr. Blackburn as describing his own work, after an earnest and well-written appeal to his countrymen not to neglect the Pyrenees, as they are far too apt to do—"following in the footsteps of M. Doré"—explains, we imagine, the anatomy of the volume. M. Doré following the footsteps of Mr. Blackburn would have been a better combination. It is natural that a Parisian artist should choose the *Moniteur des eaux* as his Mentor where an Englishman would rely on his Murray or his Packer, adding to them, if he possesses that knowledge of French which all educated Englishmen ought to, but too many do not, possess, the guide, exhaustive for the French slopes, contained in Huchette's series, written by M. Joanne, Vice-President of the French Alpine Club, and prefaced by an essay on the orography of the Pyrenees by M. Elisée Reclus. After all, the Pyrenees are very accessible. The man who leaves Charing Cross by the tidal train—say on this morning—can sleep comfortably in Paris, and find himself at the foot of the mountains by the following midnight. When he has done his tour, he will without doubt confess that, while the peaks, passes, and glaciers are inferior to those of the Alps, and lakes are almost absent, yet the range is full of grace, and often of grandeur, the Cirque de Gavarnie being, in the opinion of the highest Alpine authority, equal to anything in the Alps. On the other hand, the vegetation is far richer and the cookery infinitely superior.

Making for Pau as his starting-point, Mr. Blackburn was carried in the train by the old-world city, but still popular seat of seething mud-baths, Dax. When he talks of "the grass-grown and neglected old ramparts which form a sort of boulevard" for a town whose baths have been in high repute ever since the time of the Romans, he gives no hint that these ramparts are among the most interesting architectural remains of Europe, being veritable Roman walls, only just saved from destruction at the hands of Vandal authorities in the days of the Second Empire. The very name of the city tells its history, being merely a modification of De Aquis, and identical accordingly with that of Aix, Aix-les-Bains, and Aix-la-Chapelle, as well as with the Italian Acqui. With the Romans, who never intermitted the duty of bathing, the unusual quality of the water in these places was the fact which called for commemoration. To the less luxurious Teutons the mere fact of tubbing was the speciality; and so, not to mention the various Badens in their native land, they imposed the emphatic name of Bath upon Aquæ Solis, and knew the tepid spring in Derbyshire which the Romans had used by a title which has become Buxton, i.e. Bath's-town. With the Renaissance, at all events in England, drinking came to be the capital idea connected with mineral waters; so we had Tunbridge Wells, Bagnidge Wells, Bristol Hotwells, and so forth, till the high gentility of the eighteenth century replaced that homely term by the outlandish Spa.

Much as the present edition may have been rewritten, as the author explains that it has been, little regard has been shown for the changes which a few years have made in the rapidly developing sea-bathing resort of Biarritz, which has, like Brighton, gained in popularity by the eclipse of that distinguished patronage to which each place owed its first start. Its magnificent air, beautiful situation, and interesting scenery are enough to ensure the prosperity of Biarritz. We quite concur with Mr. Blackburn's depreciatory notice of the spot selected by its Imperial builders for the site of the Villa Eugénie; but it is an anachronism to talk of the two or three years' growth of the shrubs and trees planted round it, eleven years since its creators had even laid eyes upon it. All this time these have been growing, and the pine woods are now telling on the landscape. The Empress has at last sold her property to a Company for three millions of francs, and the sanguine purchasers have put out a jubilant prospectus, with an exulting proclamation that they are going to turn the residence into an hotel and casino; while they aver that by this speculation, and by cutting up twenty-two out of the thirty hectares of which the property is composed into villa lots, they may raise the value of their purchase to the impossible figure of nearly twenty-eight millions of francs. "The town of Biarritz," so says Mr. Blackburn, "consists of a number of irregularly built white houses, several large hotels, and a casino." All these features are still, no doubt, found there, as they were when he wrote, and among the colossal hotels the Hôtel d'Angleterre takes no mean place for comfort among the hostels of Europe. But Mr. Blackburn should have made account of the constantly-increasing multitude of luxurious villas of all sizes, with pleasures large or small, which are rapidly spreading in every direction, and will before long fill up the five miles which separate Bayonne and Biarritz, now distant, thanks to a local railroad, by only a quarter of an hour. In this lately obscure corner of Europe French, Spaniards, and Russians during the summer season jostle each other in the Atlantic, too often to meet again in the evening at the baccarat table. As soon as winter sets in Biarritz finds itself transformed into a quiet, sociable, and continuously augmenting English colony. Latitude places it on the line of North Italy. But, then, isothermal lines intervene, which an admiring American once described as things zigzagging from the Equator to the Pole, with perpetual snow

on one side and perpetual strawberries on the other. So the climate can best be described as a glorified Northern one, in which winter days feel as only some spring days do in England, not well suited for consumptive and delicate persons, but sovereign to recall the languid and the gouty to health and strength.

While other places lying at far greater distances from the mountains are noticed, although unrecorded in the *Moniteur des eaux*, it is strange that Mr. Blackburn should be absolutely silent about the historical and picturesque city of Bayonne, so famous in the final days of the Peninsular war. This old half-Spanish town, with its narrow streets, its site at the confluence of the wide Adour and the clear Nive, its fortifications, a masterpiece of Vauban, its shady public walks, its stately cathedral, and the background of the peaked Basses Pyrénées, might well be more familiarly known to the wandering representatives of the Water-Colour Societies. The cathedral, a fine building of the Middle-Pointed style, recalls in the bosses of the groined roof a chapter of French history not much relished across the Channel, for the Royal English arms proclaim who were for three centuries lords of South-Western France. The cloisters attached to this cathedral are of unusual size. Some three miles from Bayonne the fuzzy common of Mouguère offers a panorama of singular contrasts. To the south-east, far off gleam the snowy summits of the Hautes Pyrénées; southward, the dark-blue range of the Basses Pyrénées of varied outline, crasing the frontier of Spanish Basque land, and lost to the westward in infinite distance as it hugs the Atlantic: due west the ocean is decried over the rivers, the steeples, and the bridges of Bayonne; and, to the north, the broad, flat Landes spread beyond the gleaming line of the Adour. There was no obligation on Mr. Blackburn to notice St. Jean de Luz, at the mouth of the Nivelle; but, as he pleased to include it in the heading of his final chapter in connexion with Biarritz, he might have said something better worth recording than the thin persillage with which he puts off the students who may be anxious to hear something about a town of old seafaring fame, and noticeable in French history as the place where in its wide dark church—the most stately and developed specimen of Basque ecclesiastical peculiarities—Louis XIV. wedded Marie Thérèse of Spain. For one who was travelling so far along the famous *route d'Espagne* it is a strange omission not to have compassed a few more kilomètres, and carried his readers across the frontier, and bade them for some minutes appreciate in the carved stone mansions, the eves borne on richly worked wooden corbels, the half-ruined walls and castle, and the gaudily fitted Gothic church of Fuenterrabia (the Pontarabia of Milton and Scott), what are the artistic features of an unchanged Spanish town of the Renaissance, nestling under its shapely mountain upon the broad estuary of the Bidasoa.

We have referred to the peculiarities of Basque ecclesiology, and we may profitably explain in what they consist. The typical church of the French Basque land is a long hall devoid either of aisles or of marked chancel, generally with an apsidal east end slightly accentuated outside, and hardly at all so within. There are usually three altars side by side, conspicuously elevated; the floor of the church is quite open, and the apartment is circled on three sides with two, three, or four tiers of very narrow wooden galleries, presenting a curiously Jacobean effect. The women worship on the floor and the men in the galleries. We have not been able to ascertain how far back this specialty dates. Sundry of the churches are evidently wholly or in part of the mediæval period, particularly that of St. Jean du Luz, which belongs to the fifteenth century, the architecture being of a good quality; while that of Bidart is also Gothic, and the stern corbelled western belfry often found distinctly points to mediæval builders. On the other hand, the absolutely modern church of Ustaritz continues the tradition. The area of this peculiarity is identical with that of the Basque language; Bayonne and Biarritz are the border towns of the French language, and the cathedral and the parish church of the two places are respectively churches of the usual type of European Gothic; while in the adjacent parishes of Anglet and Bidart the Basque tongue prevails, and with it Basque ecclesiology. In fact, the village of Anglet, lying between Bayonne and Biarritz, isolates the latter place from the remainder of French-speaking France.

LORIMER'S INSTITUTES OF LAW.*

THERE is a certain satisfaction in reading a vigorous and well-written exposition of a theory with which one entirely disagrees. We can imagine an English student of jurisprudence, parched with the stern limitations and crabbed analysis of Austin, turning with interest, and even eagerness, to seek variety in Professor Lorimer's treatise. He would certainly not be disappointed in that respect. Almost the whole of Professor Lorimer's *Institutes of Law* deals with topics which, according to the English view, may be philosophical, or ethical, or political, but are distinctly outside the province of jurisprudence. In other words, our English school holds that the absolute law which is or should be the origin and pattern of all existing laws, *Naturrecht* as the Germans call it, either does not exist or does not concern lawyers more than any one else. What is here delivered from the Chair

of Public Law in Edinburgh is a book of *Naturrecht* from beginning to end. It contains in detail much good writing, much ingenuity, and not a little good sense on various political and social questions; the credit of all which belongs, in our opinion, to Professor Lorimer's person and in no way to his system. As to the impression made by it as a whole, we confess to feeling rather like the young man in Grimm's *Märchen* who went out to learn to shiver, and whose curiosity was finally satisfied—after the total failure of a haunted castle and other adventures—by the application of a pail of cold water from the brook with the little fishes in it. We have long known of *Naturrecht* as a thing existing in German books, but it had never come in our way to any serious extent. The German writers, for instance, who expound the Roman law for the benefit of practical students disclose very little of it. We have to thank Professor Lorimer for revealing the mystery in as good English as the nature of the subject admits. As we came to the last page we said to ourselves with a mental gasp and shiver, "Ugh! ugh! now we know what *Naturrecht* is." Natural law, as conceived by Professor Lorimer and his authorities, appears to cover a great part of what is commonly understood in this country by moral and political philosophy; the foundations of moral obligation, the extent of the power which the State ought to exercise over citizens, the duty of the citizen to obey the laws of the State, the nature of justice, the analysis of the political ideas of liberty and equality, the methods of political discipline and instruction, and much else which cannot here be specified. We find in addition a sort of introductory digression on ethnology and the history of religions, in which we observe that the discussion of Buddhism is not brought up to the existing state of knowledge on the subject. In our view it is also irrelevant, but not more so than the rest of the chapter in which it occurs. This, it is fair to say, is about the only point at which we have found anything to except to on the score of workmanship; for when Professor Lorimer's method allows him to come down to the region of tangible facts, he is generally accurate. Nor can we dispute his right to adopt, as he does in this chapter, Sir A. Grant's rather fanciful conjecture that the founders of Stoicism were of Semitic blood. A significant guide-post to the general direction and spirit of the work is the manner in which Professor Lorimer uses the term "positive law." To an English reader this means actually existing law, the law which the courts of justice and the executive powers of government enforce, or profess to enforce, at a given time and place. Professor Lorimer treats this usage as a mere aberration, and almost makes an apology for mentioning it. For him "positive law" is not the enforceable law which does exist, the law of Scotland, for example, as it stands at the date of this writing, but that which would exist if, the actual circumstances being otherwise the same, legislators and judges were perfectly wise. The law as it does exist is called "enacted law," and dealt with as on a quite subordinate footing. "Human enactments," we are told, "never attain to the full character of positive laws. But they possess the character of positive laws, more or less, in proportion to the extent to which they are, or are not, interpretations and realizations of the law of nature." In this nomenclature the law of employers' liability as modified by the Act of Parliament of last Session on the subject is only "enacted law"; the "positive law" is what an infallible Parliament would have made it—something, that is, theoretically ascertainable, but of which every man will have his own theory. In Professor Lorimer's own words, "though necessarily existent and discoverable, positive laws never have been, and probably never will be, perfectly discovered." This kind of "positive law" is, however, not coextensive with the law of nature. For the law of nature includes all moral duties without exception, and it is not to be assumed that a perfectly wise legislator would attempt to enforce all moral duties. Again, natural law is described as binding on all rational creatures, while the ideal "positive law" would, in Professor Lorimer's view at any rate, be adapted to the varying polity and circumstances of each State. For instance, the English and Scotch rules on a particular point might be different, though they were the best possible for England and Scotland respectively. Still more would this be the case as between countries in different stages of civilization.

This nomenclature shows of itself, as indeed the book shows wherever one opens it, that the school followed by Professor Lorimer concerns itself far less with law as it is than with law as it ought to be, or at least regards the consideration of law as it ought to be as forming the fit and necessary philosophical prolegomena to the study of law as it is. Our own view is a totally different one. We think it a mistake to preface the study of legal conceptions by an exposition of transcendental ethics, and not less a mistake to preface it, as Austin did, by an exposition of the principle of utility. We do not see that a jurist is bound to be a moral philosopher more than other men; though we do think it quite possible that a lawyer who happens to study moral philosophy may find a legal habit of mind and legal analogies of considerable use in clearing up his ethical conceptions. It is true that positive law (we must be allowed to use the term in the sense to which we, and probably most of our readers, are accustomed) assumes the existence of society and morality. There must be a body of men living continuously together, and there must be among them a fairly settled body of prevalent opinion as to what is right and wrong; which latter condition is not really an independent one, since if a settled common opinion about matters of conduct failed

* *The Institutes of Law: a Treatise of the Principles of Jurisprudence as Determined by Nature.* By James Lorimer, Advocate, Regius Professor of Public Law and of the Law of Nature and Nations in the University of Edinburgh, &c. Second Edition, Revised and Enlarged. Edinburgh and London: William Blackwood & Sons. 1880.

to become established or ceased to exist, the society could no longer hold together. As a further condition for the existence of law as distinct from custom and morality, or, to speak more exactly, for the differentiation of law and morality out of custom, there must also be a general understanding that some rules of conduct are fit to be enforced by definite means of compulsion, and in the last resort by the whole power of the society, and others are not. And there must be some sort of common agreement, though it may be, and mostly is, a vague and rough one, and obscurely felt in the common sense of the average citizen, as to the boundary to be drawn between these classes of rules. Yet more is wanted before we can have a civilized and effective system of law. The commonwealth must assume and exercise a power beyond that of issuing commands for the purpose of repressing actual crime and wickedness and strengthening righteousness. There are many matters indifferent in themselves in the sense that they may be dealt with in one way as well as in another, but not indifferent in this sense, that it would be of great inconvenience if they were not dealt with in some uniform way. We may name the rule of the road as a simple and familiar case. On such matters the community lays down fixed rules, not to enforce this or that course of action as right in itself, but just for the sake of having a fixed rule. These rules, when made, are as much entitled to observance as those which add the legal sanction to what is already prescribed by morality; though we rather fail to see what account can be given of them by those who put their trust in the supposed law of nature, unless they come down for the nonce to a "question of what is vulgarly called expediency," as Professor Lorimer delicately puts it. Reflection shows that all positive law must have more or less of this arbitrary, or rather discretionary, element. For while the moral law says to an Englishman, as it did to a Roman, "Thou shalt not steal," the Roman law said, "If you steal you shall be liable to an *actio furti*," but English law says, "You shall not be liable to a civil action, but you may be tried by a judge and jury and sentenced to penal servitude." English law, moreover, defines with great elaborateness, and perhaps not with perfect reasonableness, what is and what is not theft. But in administration the substance of the law cannot be distinguished from the particular definitions and provisions in which it takes its form. For if this and that citizen were free to observe or not observe it at his discretion in this or that particular, it would no longer be law. And thus among civilized people, after the distinction between law and morality is fully established, it comes to be understood that it is a specific moral duty to obey existing positive law, not only when we cannot see the reason for it, but when we think the reason a bad one. This is subject to the exception of the extreme cases in which rebellion is morally justifiable; and the case of a serious claim of legal right as against a particular authority within the State, or a usurping power, is not an exception at all. But it is understood, or ought to be, that to refuse obedience to an existing law because one dislikes it is, as far as it goes, rebellion and nothing else. And even in exceptional cases persons who resist the *de facto* possessors of legal power do it at their own risk, and cannot complain of being treated as law-breakers or rebels if they fail.

We have thus set down with needful brevity what we conceive to be in a general way the moral data presupposed by the positive law of civilized nations. It will be observed that we have said nothing whatever about the historical or rational origin of morality, or the nature of moral obligation in itself. We have tried to say nothing inconsistent with Professor Lorimer's or any other transcendental scheme of ethics. We take the morality of men living together in settled societies as an existing and sufficiently ascertained fact. It is for the moralist and the metaphysician to analyse it if they can; enough for us that it is there. Even with this limitation we do not think that the statements we have made, be they right or wrong, are propositions of jurisprudence. The topics may be admissible as belonging to a sort of borderland or penumbra of legal science. An introductory sketch of the outlying affinities and analogies of a special subject is in many ways useful, and is common in the practice of teachers. But we deny that the jurist requires, as Professor Lorimer assumes him to require, "an absolute basis for his science." Why should he not, like other people, be content with a basis of acknowledged fact? Positive law exists. In other words, there are certain social institutions which are protected, and certain rules of conduct which are in various ways and degrees enforced, by the courts of justice of all civilized countries. The fact is notorious and intelligible to all men of all ways of thinking, whether they account for it by deduction from the law of nature or otherwise. If the jurist accepts it as for his purposes ultimate, he does only what all other students of special sciences do; we may add, what they did and must have done in order that those sciences might be constructed. Where would geometry be if the geometer were expected at the outset of his work to grapple with the metaphysical difficulties that beset our notion of space? Where would physics be if the physicist had to explain the existence of matter? We know very well that Kant himself expected nothing of this kind from men of science. And the cases appear to us precisely parallel. Geometry is the science of space, and physics the science of matter, in the same way that jurisprudence is the science of laws. Special sciences furnish the data of philosophy; they do not need a complete philosophy to stand on their own ground. If they did, we should be in but a sorry plight. Observe, too, the warning to be derived from the analogy. Dis-

cussion of the nature of space is rendered possible only by a highly developed geometry, rational discussion of the nature of matter only by advanced physical knowledge. And we may fairly contend, without prejudging the issue between transcendental and empirical theories of duty, that profitable discussion of the origin and nature of laws in general must follow, and not precede, the scientific study of laws as they exist. Whether that study can in the long run be conveniently exhibited as a thing apart from and theoretically preceding the study of any particular system of laws is a question which, we think, deserves attention. We said something about it last year in reviewing Professor Holland's *Elements of Jurisprudence*, the latest and, on the whole, the best representative of the English school. It does not come before us now, for the simple reason that Professor Lorimer barely gets to the threshold of the topics that properly belong to jurisprudence, general, comparative, or particular, as understood by Professor Holland and ourselves. To sum up our general criticism: the jurist or legislator, on Professor Lorimer's own showing (see p. 250), has to accept the laws of nature as facts. If, as facts, they are equally accessible to all rational men, and equally material to be known and acted upon, we cannot see why the jurist is bound to analyse them philosophically more than any other rational man. If in the knowledge of them there is anything peculiar to jurists or legislators, they seem to that extent to lose the universal character which is said to be a mark of natural law. So far as the *insti atque iusti scientia* from which the lawyer starts is something which he does not share with laymen, it is a special and technical piece of knowledge, a law of lawyers' nature at most, not of human or rational nature.

But after all, it may be said, writers are free to define their subjects in their own way. The University of Edinburgh and its professors have a perfect right to say that "Institutes of Law" shall mean the general prolegomena of politics and the theory of legislation. To this we reply that the same method which, in our opinion, leads to a misconception of the nature and scope of legal science no less appears to us to lead to waste and misdirection of power in the subjects actually treated by it under the name of legal science. It may be the radical perverseness of English habits of thinking, but in our eyes much of the work done by Professor Lorimer—and, as far as execution and expression go, thoroughly well done—arrives either by high-flying and circuitous roads at obvious general conclusions, or at more precise ones by a slenderly disguised appeal to the principle of "what is vulgarly called expediency." Thus the question is brought up of the State's right to inflict and regulate punishment, a question which, from the English point of view, has in jurisprudence no meaning. The solution comes round, however, to the position that for the individual citizen the State is infallible. "The fact that one form of punishment attains the object of the absolute law better than another must be proved; but the competence of the Legislature to determine the adequacy of the proof must be assumed as the hypothesis on which all positive law rests." More than once, indeed, we have a feeling that, while the voice is the voice of a teacher propounding transcendental *Naturrecht*, the hands are the hands of Hobbes. In Professor Lorimer's system right and might ultimately coincide; as they likewise do, be it observed, in Mr. Herbert Spencer's, or in almost any scheme which takes account of the progressive character of morality and civilization. Further, Professor Lorimer holds that we must act on that which appears, and that for many purposes might is the best or only evidence of apparent right. He fully accepts the position that "right to be" is measured by "power of being," and thus gives a hand back to Hobbes and forward to Mr. Spencer. As between independent nations, he lays down permanent success as the permanent test of right. Only righteous conquests endure, and all enduring conquests are righteous. And yet almost in the same breath Professor Lorimer makes the statement, to our Southern ears paradoxical, that laws cannot create rights, and calls to witness a famous passage of Burke's of which it is sufficient to say that Burke spoke not as a jurist, but as a statesman. In denying "the position that any body of men have a right to make what laws they please," he was really protesting against that very confusion of legal right with moral right, or political utility, which the transcendentalists bring back from the other side. What Professor Lorimer is doing is to state in the transcendental manner that laws will not work, or will work badly, if they are made without due regard to the facts. The matter is true, but the manner is itself a defiance of fact and usage. Laws made by the supreme power in a State, be they wise or foolish, do create claims which that power will, by the Courts and otherwise, do its best to enforce, and these claims are called rights by everybody save transcendental philosophers when they are philosophizing.

We have been unable to do justice to the considerable amount of acute and suggestive thought to be found in Professor Lorimer's book. As the systematic exposition of a theory and method which we believe to be erroneous, we must receive his work with respectful but absolute dissent. As embodying the reflections of an experienced and high-minded man on many things of practical interest, we can sincerely welcome it, and say that we are the better for it. One last word, not of criticism, but of pure sorrow. It appears from sundry references in Professor Lorimer's book that the students of Edinburgh who cultivate philosophy are still brought up on Sir W. Hamilton's Lectures. It is melancholy that the Philosophy of the Conditioned should still impose, or be imposed, upon anybody in the country which produced Ferrier.

THE SHAKSPEARE TAPESTRY.*

THIS book owes it to its title that it is not left in the mild obscurity proper to the body of minor verse. In quality it is perhaps lower than the average of that verse, but not so much lower but that it might well have escaped the critical eye save for its singularly bold ambition. We are accustomed to think that the world is growing drearier and wiser, and we need a little book like this to remind us every now and then that there still are some delightfully silly people abroad in it. *The Shakespeare Tapestry* is a grave and ambitious effort, and we shall endeavour to examine it with due gravity and care. In the first place, we are well disposed towards an author who does not write "Shakspeare," a form which we are delighted to see that even Professor Dowden has abandoned, and which is now left undisturbedly to the Now Nest of Ninnies. The scene of Mr. Hawkey's poem is laid at Clovelly, and the moment chosen is that in which the last beams of the sun pour through the oriel window of a mansion old and grey, where "lovingly they seem to rest on two young maidens side by side, whose sisterhood was self-confessed. The fairest portraits Fancy draws do not such charms display as theirs might claim if limned by Truth," and their names are Margaret and Ellenore. We must not linger over the upholstery of the baronial hall, except to say that its roof was carved in shapes "anticipative of the Darwinian theory." However, in spite of the rare state of preservation in which this agreeable old residence is found, in one respect the hand of the Vandal has been at work. The local 'Arry has torn down the famous tapestries of the great hall, and has whitewashed the spaces behind. Now Margaret and Ellenore are ladies of fine conservative feeling, and they determine to weave with their own lily fingers tapestries that shall fill the place of those which are lost. We are now told the date of the story, or at least we are told it within nine years. The action takes place at a time when Shakspeare's works were only to be obtained in the first folio. This limits us to the space between 1623 and 1632, so that the date of Mr. Hawkey's poem is what bibliographers call circa 1630. We are told "Light literature was then unknown"—we suppose at Clovelly, for there was plenty of it in London—at all events, the ladies Margaret and Ellenore had nothing to read except the folio Shakspeare, which they preferred to every sort of poetry except Homer, whom they probably knew in Chapman's version. So they determine to take the subjects of their tapestries from Shakspeare's plays, just as any modern young ladies of to-day might think of doing, and they each perform six, with a great deal of assiduity, and cheered by boundless mutual admiration. On the evening when the sun looks in at them through the oriel window, the work is just completed, and Margaret desires her sister to hold up what they both have done, that she may

pass just judgment on our stitchery,
In spite of thine and Shakspeare's witchery.

The first specimen held up is Ellenore's handicraft, and displays Prospero and Miranda on the seashore. Margaret describes it at great length in cheerful anbling verses, closing thus:—

"Your work suggests all this—and more;
Now read from Shakspeare, Ellenore,
The scene your needle has portrayed."
"Nay, Margaret, thou flattering maid,
So should thy bright description fade
As torches, when the night is done,
Sink in the splendour of the sun!
Rather unroll the next design,
And proudly thou mayst call it thine."

This proves to be the death of young Talbot, from the First Part of *Henry VI.*, and calls for no special remark from us, though Margaret—obscurely, and with the assistance of a learned note—compliments her sister on having produced in it "a Union pearl." Ellenore is then encouraged by Margaret, whose foible it is to be a little fulsome, to unfold her next piece of work, which is a scene from *Midsummer Night's Dream*, lyrically described in verses that all students of the seventeenth century will recognize as having the exact movement and stamp of 1630, the age of Drummond, Herrick, and Carew. Here is a specimen:—

Our queen alone is sleeping
Within her perfumed bower,
Where the honey-dew is weeping
Over every leaf and flower;
And we blithe watch are keeping
Until her waking hour.

There is a great deal more of this, which so delights the ear of Ellenore that she vows that the absence of the nightingale from Devonshire is explained at last—it is afraid of Margaret's supremacy, and knows the danger it would run of "expiring on the lute," just as other people of that time were shy of going to London for fear of expiring on the block. We must pass hurriedly over the scene from *Julius Caesar*, although it contains some delightful verses, in this form:—

"Hoping to warp a noble heart
To act a mean and treacherous part,
There Casca with his visage tart.

But we must hasten on to a tapestry that we fear will give a great deal of trouble to the commentators. The scene is taken from *Pericles, Prince of Tyre*, and represents the famous shipwreck. But the difficulty here is that the folio of 1623 does not

include *Pericles*, which makes its first appearance in the third folio of 1664. How, then, did the young ladies get hold of it? Was a copy of the corrupt quarto of 1609 slipped into the folio by an injudicious friend? These are queries which Mr. Hawkey is bound to answer; and we must hope that he will contribute a paper on the subject to the "New Shakspeare Society." It is exceedingly curious to find so early a testimony to the spurious character of this play, and we invite Mr. Furnivall's attention to these remarkable lines:—

The scene is charming; but, alas!
It grieves me much that I must call
Th' authority apocryphal;
Since the best judges all conspire
Against the wandering Prince of Tyre,
Refusing *Pericles* the place
He claims as one of Shakspeare's race.

Nothing could be clearer than this, except the personal testimony of Ellenore; and so, after an interminable description of the tapestry, we come to this lucid statement, which, made as it was within a generation of Shakspeare's death, should be regarded as settling the question at rest for ever. We may say, without frivolity, "Dear Mr. Hawkey, *Pericles* and we owe you a heavy debt":—

Dear Margaret, *Pericles* and I
Owe you a heavy debt!
Safely in charge of memory
Shall all his tale be set:
But you've dethroned him—in my mind
He never more can be
A claimant worthy of a share
In Shakspeare's Royalty!
None of his characters require
To have their story told;
Memory hath wrought them in a web
Formed of the purest gold.

To this succeeds, in abject confutation of the sentiment of the last stanza, a tapestry in which the story of the *Comedy of Errors* is minutely told, and then Part I. closes.

The opening of Part II. is intended to be strictly Jacobean. The gifted sisters don their wimples and hie into the woodland, and we are treated to forty pages of their conversation during their moonlight walk, which was disturbed by the very rude way in which a night-jar and an owl behaved. In spite of the "inharmonious vigil" of these tiresome birds, the young ladies got through an immense amount of irrelevant talk, and finally settled down into recounting to one another the history of their own family. It is a vague tale of how a certain Arthur Hammeline and his wife wandered into the woods of Clovelly till the tempest—but we are not told what tempest—burst: how a certain Philemon was standing in the Sistine Chapel when he heard that the tempest had burst, and how he hied home, after a long gaze at the Cumean Sibyl; "Soon to Clovelly Court he came, and with him was a stately dame, his sister, Lady Arminell." Then we are introduced to a mysterious twin-brother, Reginald, who seems to be lurking somewhere about the place; the sisters join in singing a flat moral hymn, such as we can imagine being sung in Positivist places of worship, in this style:—

In its cold induration,
We find the human brain
Impervious to th'impressions
Which once it could retain.
With marvellous persistence
The soul's redundant power,
In the spring-time of existence
Weaves through each sleeping hour.

And then at last they go to bed. Next morning "the first to speak was Ellenore," who mentioned to her sister that the subject of the next tapestry occurred to her

When journeying over hills and dales
With Lady Arminell in Wales,

the rhythm of which verses is perhaps a little too closely modelled on that of a couplet by Mr. Roden Noel,

The blind man laughs when on the stairs
He hears his children playing at bears,

and so we are introduced to the story of Valentine and the Duke from the *Two Gentlemen of Verona*. The next is taken from *Troilus and Cressida*, and deals with the parting of Hector and Andromache; but for some obscure reason Mr. Hawkey feigns that his heroines found it, not in Shakspeare, but in a black-letter MS. called the "Legends of Etolia, translated from the Greek, with notes and comments, by E.H." This might be an unknown production of Edward Hall, although the style of his existing remains suggests that a little judicious humanism was just the one thing lacking to him. But we hardly can fancy that he would have put so simple and so quiet a title to his translation. These ancient poems, however, from whatever source the young ladies have obtained them, are exactly in the manner of their own verses. It must be confessed that there is but little of the sixteenth century in such a stanza as this:—

'Tis evening now at Argos,
After a sultry day;
The dew is on the myrtle-leaf,
The heat has passed away;
And the fountain in the olive-grove
Is circled round and round;
There strains of music fill the air,
And happy voices sound.

* *The Shakespeare Tapestry woven into Verse.* By C. Hawkey. London: William Blackwood & Sons.

This is more the style we expect in a "black-letter manuscript":—

Now hasty Titan doth descend
On Argos' sunny shore,
And with his trickling dew doth wet
Leaves that were dry before.

The "Etolian Legends" then proceed to give the life of Diomedes, but we have really accompanied this very silly book far enough. That there should at the present time of day exist a person who thinks that he can improve or adorn the beauties of Shakespeare by retelling them in pedestrian verse which has not the slightest power of keeping up the illusion of antiquity seems to us a fact phenomenal enough to excuse us for having taken up so much space with the examination of the *Shakespeare Tapestry*.

THE BROTHERS WIFFEN.*

TWO years ago we drew attention to a small bequest of Spanish books which had then just reached the library of an Oxford college, and to the life and work of the retiring Quaker scholar to whom they had belonged. The only material then available for a sketch of Benjamin Barron Wiffen was to be found in a short notice of him prefixed to the *Bibliotheca Wiffeniana*, a collection of monographs on the Spanish Reformers, based upon Wiffen's notes, but undertaken after his death by the German scholar Dr. Edward Boehmer. The present small and unpretending volume contains all that this first sketch contained about Benjamin Wiffen, with a good deal of fresh matter, and includes also the life and original poems of Benjamin's better known brother, Jeremiah Holmes Wiffen, the translator of Tasso. It would not be difficult to pick holes in the literary execution of the two memoirs. Neither of the lives can be said to be good as a biography. There are a good many slips of style and arrangement; there is a natural, but not the less provincial, exaggeration of the literary position of the brothers running through both; and there is no attempt to set the lives against the background of the time, and to show us how the great literary names, the great political and theological currents of the day, affected this quiet pair of Quaker students. We have a little talk of Rogers and Campbell, of Moore and Byron and Leigh Hunt, in connexion with one of J. H. Wiffen's rare visits to London; and Benjamin Wiffen, as became a Quaker, took an active part in one or two episodes of the Anti-Slavery agitation, and from this point of view appears to have been deeply moved towards the end of his life by the spectacle of the American war. But there is so little of the outer world in these biographies that either the two brothers must have been really outside the main current of things, or their biographers have omitted the material which would have enabled us to judge of their relations to the men and events of their time. Perhaps the latter alternative may be true in Jeremiah's case. He was apparently the more sociable, and certainly the more educated, of the two brothers, and we imagine that his position as librarian at Woburn, and the relations with literary men which his translation of Tasso brought him, must have modified the original Quaker *bourgeois* in him more effectually than the present memoir would suggest. But in Benjamin Wiffen's case, at any rate, we have a life passed in devotion to books and poetry, and yet at the same time in entire remoteness from the literary and antiquarian coteries and the central poetic tradition of his day. When he writes poetry it is in imitation of Cowper or Crabbe or Goldsmith; though he had made an early pilgrimage to Itald Mount, Pope is more real to him than Wordsworth, and of Byron, Shelley, Keats, Tennyson, the sources of modern poetry, we have scarcely a word or trace. So with books. A person with his bent, in the natural course of things, finds a niche in some of our various antiquarian Societies. But Wiffen prides himself on the fact that he has been indebted to no Society for help in his biographical work; he collects books partly from religious motives, partly out of love for a friend to whose work and aims he rigidly subordinates his own, and partly, no doubt, from a vein in him of the true book-collector's passion. But the books he collects have no interest for anybody but himself and half-a-dozen like-minded friends. Nor does he ever imagine that they have; only he allows himself the enthusiast's hope that his unnoticed work will blossom and bear fruit in future times when he will be no longer there to see. It says a great deal for the quality of character in this isolated and narrow personality, that, in spite of all his prejudices and limitations, in spite of the strong leaven in him to the last of the provincial Quaker tradesman, there is yet an undeniable charm and attractiveness about Benjamin Wiffen which affects us even through the medium of a rather clumsily written memoir, and makes us grateful for the scanty store of fresh information about him which this book supplies.

We have already sketched in these columns the main facts of Benjamin Wiffen's life; his birth in 1794, his early love for and companionship with his brother, that brother's death in 1863, his meeting with the Spanish scholar Uzo y Rio in London, 1836, and his subsequent researches into the bibliography of the works of the Spanish Reformers which that meeting and the friendship which followed upon it brought about. Mr.

Rowles Pattison's memoir does not add much to our knowledge of these facts, but here and there we find fresh touches which enable us better to realize the man and the quiet intensity of his life. Up to his brother's death in 1837 Wiffen was pursuing the trade of an ironmonger in the little town of Woburn, reading whenever he could get time for it, discussing his brother's literary projects with him, but rigidly determined not to let any poetizing tendencies interfere with his own attention to business, which he regarded as his proper work. "The brothers had at first," said Mr. Pattison, "together cultivated the art of poetry; but Benjamin, finding that its pursuit was likely to lead him astray from the stern requirements of necessary business, deliberately abandoned it, and committed most of his previous efforts to the flames." But about a year after Jeremiah's death Wiffen gave up his business, and took his mother and sisters to live in a cottage on the hills above Woburn. Henceforth his life was filled with the quiet literary interests which, up to the age of forty-four, he had deliberately postponed to other duties. He seems at first to have turned to poetry; but he had no real poetic gift. His long poem on the Quaker Squire is worth notice as evidence of the cultivation which seems to be the natural heritage of the Friends, in whatever stratum of life, and contains passages which might be Cowper's. But, as a whole, his verse is feeble and undistinguished, and is not worth preserving for its own sake. The following verses are taken from what is perhaps his best poem, "The Church in Decay," a melancholy and rather striking reverie on the decay of the Society of Friends, which is interesting, moreover, as expressing a feeling which must have been common to many a devout Quaker during the last quarter of a century:—

The Presence past, the elders mourn,
All few, forsaken, and forlorn;
While works the progress of decay
Without the power to stem or stay.

The spot, once favoured of the skies,
Is now but rich in memories;
And chronicles record alone
The Fathers' virtues all their own.

Relenting Time, who something saves,
Leaves them now little but their graves;
A second death is on his wing,
For even these are vanishing.

The words of Ministry and Prayer
Evaporate to common air,
And souls that would in worship rise
Expire upon the sacrifice.

In tears there might be some relief,
For strength itself can grow in grief;
They cannot weep, the heart appears
Too spiritless for even tears.

Call it not Martyrdom to feel
The Inquisition's fire and steel;
This cold and heartless waste at home
Is Truth's most bitter martyrdom.

It was not in poetry, however, but in a kind of religious anti-quarianism, that Wiffen's later life was mainly passed. About the year 1836 he made acquaintance, as we have said, with Uzo y Rio, a Spanish gentleman of means, living at Madrid and outwardly a Catholic, but at heart a kind of Spanish George Fox, imbued with what in England would be called strong Evangelical principles, and absorbed in the desire to rescue and restore to currency the fragmentary and scattered works of Spain's small band of Reformers. Such a character, with such an aim, could not but attract Wiffen's sympathies, and a close and intimate friendship sprang up between the two men. Thenceforward Wiffen was Uzo's devoted helper and co-worker. For more than twenty-five years the two gave their whole time and energy to searching out what was almost an extinct class of books, and to reprinting and editing them, when found, with the most scrupulous and loving care. The libraries of London, Cambridge, and Oxford were ransacked by Wiffen, who also kept up a persistent hunt in all kinds of holes and corners, which was on one or two occasions rewarded with prey worth having. He also established relations with students and librarians on the Continent; and it is to one of these foreign friendships—that with Dr. Boehmer, of Halle—that the present German continuation of his work is due. His acuteness in tracing books and investigating details was very great, and he rendered Uzo invaluable service. The results of their joint labour are embodied in the twenty volumes of the *Reformistas Antiguos Españoles*, a book in which the remains of an all but forgotten chapter of religious history have been placed high and dry above the risk of future shipwreck. Throughout the whole of this long labour, Wiffen worked in modest and willing subordination to Uzo. At one time, filled with a book-collector's sense of the perils of the post, he hesitates to transmit a unique book to Uzo at Madrid. But, in the end, "I parted with the book I so much loved, sending it on the uncertainties of foreign travel to my friend Luis; for I had made it a rule of my conduct to sacrifice the choicest object to him, whose superior talents and learning I was well persuaded would make better use of it than I could." "The learning was his," he says, speaking of Uzo after his death, and of the series of the *Reformistas*—

The talent, the expense were his; mine the advantages of liberty and free action, and residence in a country which furnished the readiest means for the acquisition of this kind of knowledge. We both were favoured with

* *The Brothers Wiffen: Memoirs and Miscellanies*. Edited by Samuel Rowles Pattison. With Two Portraits. London: Hodder & Stoughton. 1880.

leisure, we both had the simple and independent means of livelihood; we wanted no more. We both repudiated the thought of accepting assistance from any society or association, for our views were not mercenary, neither were they directed to immediate, but future results, because we firmly believed that these results would manifest themselves long after we had ceased to live.

In 1865 Uzoz died, and the effect of the loss on his surviving friend was very great. "His pleasant and instructive friendship for twenty-five years has been the charm of my life," writes Wiffen; "with him all our work seems ended." It was after Uzoz's death, however, that Wiffen brought out his only independent literary venture, the *Life of Juan Valdes*, prefixed to a friend's translation of one of Valdes's works. It appeared in 1866, but it had only small success. Wiffen did not possess sufficient original literary power to make up for the lack of ordinary classical and university training; and of composition, whether in prose or verse, he understood little or nothing. He could collect materials, but he could not put them into shape. He is best commemorated by such a book as the *Bibliotheca Wiffeniana* of Dr. Boehmer, which, though based upon his labours, and bringing his minute and patient industry into view at every page, owes its final shape to other hands than his. He died in the spring of 1867, and such of his books as had not passed into his friend's possession, or were not in use by Dr. Boehmer, came in 1878 to find a resting-place in the library of Wadham College. Wiffen, in one of his various visits to Oxford, had probably been attracted by a Spanish collection already existing there, and perhaps also by the Evangelical traditions of the College. However this may be, the books make a welcome link between the University and one who, without the aid of University training and University friendships, developed many of the student's best habits. A University training would have protected him against many obvious literary faults. Would it, at the same time, have extinguished his one gift—his love of patient and minute research?

The gift of sentiment and enthusiasm which, exercised now on his friend, now on his books, redeemed Benjamin Wiffen's uneventful bachelor life from dullness was still more evident in his elder brother. Jeremiah Holmes Wiffen, who died suddenly at the age of forty-three, in the midst of what might have been a fruitful literary career, had perhaps no more original power than Benjamin, and he had received no education, in the narrower sense, beyond what the well-known Friends' School at Ackworth could give him. But he had more literary capability than his brother, and his industry, his devotion to books and poetry, his sympathetic, intelligent temperament, might have achieved for him in later life some considerable literary success. As it is, his work is forgotten. The translations from Garcilaso and Tasso are musical and fluent; but here again there is no distinction, nothing first-rate, just as there is nothing first-rate in the knowledge shown in the *Essay on Spanish Poetry*, or in his *Historical Memorials of the House of Russell*. What is really noticeable in both the brothers is, first, a sweetness and refinement of character of a peculiarly English, perhaps a peculiarly Quaker, type; and, secondly, the amount of cultivation to which they managed to attain wholly outside the London and University circles which fill the foreground of literary history at the time. This is scarcely enough to constitute a claim to remembrance beyond an immediate generation of friends and co-workers. Short of the highest literary achievements, what does contribute a claim to remembrance for any writer in these busy days? It is hard to say. But there are, at any rate, some classes and qualities of writing short of the highest which obtain it more readily than others. Clough, too, died in his forty-third year, and he, too, left an immature production—a promise rather than a performance. But in him there is the central permanent note. With great original capacity for seeing and thinking, he saw with his own eyes and thought his own thoughts. And for seeing and thinking of this kind no mere literary enthusiasm and sympathy, if real, can ever be accepted as a substitute.

THE BRIDES OF ARDMORE.*

THIS "Story of Irish Life" certainly comes before us at a most unfortunate time. We are weary of Ireland and Irishmen. We would willingly forget St. Patrick, Erin, and the green island for the rest of our lives. A people which once was associated in every one's mind with much that was humorous and pleasant, now raises in us all a sense of unspeakable dullness and weariness. Their nature may, for all we know, remain unchanged, but they have chosen for their representatives and spokesmen the greatest bores on the face of the earth, and by these they must be judged. At the last election for the School Board of London one candidate, it was said, owed his return to the fortunate fact that he was a Guardian of the Poor. His brother Guardians had been so greatly wearied by his long speeches that they all exerted themselves to the utmost to secure his election to the School Board. When he was once there they knew that they should be safe from him, while they were utterly indifferent to the comfort of others. We should like to believe that there was still humour enough left in the Irish character for them to have combined, in like manner, to banish their greatest bore to England. If this were the case, cer-

tainly no more successful practical joke has been played than sending Mr. Parnell and his followers into the House of Commons. Yet, we fear, that Ireland cannot claim the credit for so much humour, and that dullness and stupidity have become, like the potato, one of the staple productions of the island. We were not a little confirmed in this belief as we tried to read the story before us. We have been used enough of late to struggle through obstructions. We were out in the great snowstorm, and we stubbornly faced the furious east wind. We have plodded on over miles of roads on which the snow lay nearly a foot deep, and we have even managed to get through some very heavy drifts. The same resolution we have brought to bear on this "Story of Irish Life," but we have to confess that we have been hopelessly beaten. We tried it one evening, and after a quarter of an hour we laid it down in despair. We gazed at the book in a kind of trance, even our very limbs felt almost numbed by its hopelessness, stupidity, while our weary eyes scarce kept open. We roused ourselves with an effort. We thought of Ulysses and all that he had gone through. Like him, we smote our breast and exclaimed, "Endure, oh heart; also before thou hast endured worse things." We brought up before our memory all the sermons and speeches that we had heard, and all the old ladies' talk that we had listened to. We reminded ourselves that even the debate on the Queen's Speech has had an end, and that Mr. O'Donnell cannot speak for ever. Encouraged by these thoughts, with high-strung courage once more we resumed our task; but once more did we find that we had over-reckoned our spirit and our endurance. If we really meant to read the story through, there was, we saw, but one resource left to us. We ought to send over to Ireland for those newspapers which give full reports of the speeches of the Home Rulers. If we could only succeed in getting through one whole debate, we felt sure that, coming as a contrast, *The Brides of Ardmore* would really prove light reading. But was the result likely to repay the misery which we should have undergone? A story is told of an ingenious dentist who proposed to have a large spike let into the sole of one of his boots. When he was on the point of drawing a tooth he would, at the very moment that he gave the first pull, drive his spike into his patient's foot. The sudden pain, he expected, would so divert the sufferer's attention that the tooth would be extracted without his so much as noticing it. The experiment, we believe, has not yet been tried, and so we can say nothing about its efficacy. We however, after carefully considering the plan that we had thought of, decided that, on the whole, it was better not to waste time in trying it. We more than doubted our resolution to read a single Home Ruler's speech, and we felt sure that we should never be able to read as much as would be required to render the book before us an agreeable change. We have, therefore, gone through it as best we can, and have picked up as much of the story as can be learnt by one who has kept just short of reading enough to fall into a stupor. We cannot say that we have skimmed it, for such a book as this has not a surface that can be brushed lightly. One might as soon hope to skim an Irish bog, or one of Mr. Biggar's speeches.

It will be a relief to the reader to learn that, though the scene of this story is Ireland, yet its date is some seven centuries ago. Instead, therefore, of coming across Mr. Parnell and his crew, he has to begin by merely making the acquaintance of the heroine's great-grandmother. This admirable lady was the wife of "a wealthy Bo-aire, or gentleman-farmer, as he would be called in these days." She and her daughter lived such virtuous lives that they "should have been considered as two of the palatial corner stones" in the Church. The works of this great-grandmother were, indeed, excellent. "Many clerical families in the neighbourhood," we read, "had been supplied with good servants through her tuition." We are surprised to find, however, no mention of her having established Mothers' Meetings; or of her having distributed tea and temperance tracts. She had her trials, just as if she were a virtuous great-grandmother of the present day. The clerical families were not as grateful as they ought to be. "The advantages" of having well-trained servants supplied to them "were taken by them as a matter of course, it never once occurring to the lady members to place her labours on an equality of importance with their own." It is sad to think that even before the days of Strongbow gentlemen-farmers in Ireland and their wives were so snubbed by the wives of the parsons. It is little surprising that soon after this date the celibacy of the priests was enforced in Erin. Happily the great-grandmother's character "was too much tempered by humility for her to perceive" that she was slighted. Her daughter, the heroine's grandmother, cherished, we are told, a more far-reaching ambition. "Her rich intellect was as hoamy land which has lain far down in a valley." She took trouble to cultivate society, and "her suppers became celebrated not only for their culinary excellence, but for the flow of wit with which the viands were seasoned." In another passage we learn somewhat of these Irish suppers. There we read that "the viands were simple, but exquisitely cooked. A lamb and a sucking-pig roasted in honour of their guest, were flanked by loaves of wheaten bread, and balls of golden butter nestling among delicate watercresses." Butter—however golden it may be—does not, by the way, seem to go well with sucking-pig, however exquisitely it may be cooked. But to return to the heroine's grandmother. So charming was she that our author says "we may doubt if the great Co-arb of Patrick himself had a more sprightly circle round his hearth." We should better understand the force of the praise did we know what kind of a thing or person a Co-arb is, whether it be great or small.

* *The Brides of Ardmore: a Story of Irish Life.* By Agnes Smith, author of "Ella Maxwell," "Glenmaria," &c. London: Elliot Stock, 1880.

We presently arrive at the heroine's mother and maternal aunt. The aunt was "a very consequential little person, arrogating to herself the first place on all occasions." The mother happily was of a meek character, and "came at length to acquiesce in that view of things which placed her sister on a lofty and unapproachable pedestal." We have the following picture of their home:—

Theirs was indeed a happy home. All that could ennoble their young lives was present in full measure. The work of superintending servants, of instructing the ignorant of their own sex, and of economising in a way which had no savour of niggardiness, was but the necessary foundation on which their parents reared a structure of unbounded generosity. Amada was of a lively temperament; her husband no less so; innocent mirth and frolic were encouraged in so far as they did not trespass on the seriousness of work, or of religious duties. A cynical critic might have whispered that kindness to strangers was being carried too far; that the goods so lavishly bestowed on distinguished pastors might have been laid up for the girls' marriage portions. But Moriath and Grainé were too ignorant to cavil at this.

Our author before long takes us from gentlemen-farmers and the tuition of servants for clerical families to the great heroes of Ireland. We read of Brian Borumha, Turlough O'Connor, and Blathmac O'Mannahan. We are next introduced to a long succession of bishops. But by "bishop," she informs us, "is meant, not the magnificent dignitary who now bears that title, but a member of the class to which it was applied by the Irish of the first eleven centuries." When we reach them we have nothing more to do with the gentlemen-farmers; for, so far as we can make out, all the young ladies marry bishops. The heroine's father was a very good bishop, and the heroine's maternal aunt's husband was another bishop, though not quite so good a one. When she herself grew old enough for a lover two bishops wooed her. One was Ardal, the good hero, and the other was Fergus O'Mannahan, the villain. The latter of these reverend gentlemen would seem to be the model after which not a few of the Irish orators of the present day have trained themselves. He talks as much flowery nonsense as if he were an Irish member of Parliament. "He was not only magnificent in the pulpit," says our author, "he was the cynosure of all eyes in social life. . . . He was, indeed, eminent." He almost turned the heroine's simple heart. One evening she had gone "in quest of her usual supply of milk." He came suddenly upon her, looked at her with peculiar tenderness, took the can from her hand, and said, "Thou hast a step like Venus when she vanished from her perplexed son. Thy ringlets, too, scatter ambrosial fragrance on the breeze." Happily for her, her virtuous lover Ardal was not deficient in counter attractions. He had not only an air of distinction which set off his handsome figure to advantage, but he could boast of high birth; for he was the only child of Turlough O'Brien's marriage with Tualath, daughter of O'Faolain, Prince of the Deisi. The day after he proposed to her she dressed with alacrity, and went out for the milk herself. "The very cows turned round their sleek heads, as if they saw something new about her. . . . The sky had never looked bluer, nor had the fleeting grey clouds which speckled it assumed a more exquisite contour." He soon marries her; and, though she has to own "that he can be authoritative when he likes," yet they lived happily together for a time. Unfortunately, their peace of mind is disturbed by one of those prophets who always flourished a certain number of centuries ago. One day they passed a well-known pond. "Its surface seemed to heave as they drew near, and from beneath a mass of yellow floating vegetation emerged a figure of uncouth aspect." This figure was always lifting a long bony finger, and peeling out in a deep sepulchral voice cries of "Woe! woe!" In the end the English invasion begins, and the heroine and her lover at last get drowned, to the unspeakable relief of the reader. The only pity is that the waters of the river did not swallow up, not only the wealth of the heroine's blonde hair, but also the history of her life.

ARROWS OF THE CHACE.*

THE consent, and, in a way, the concurrence, of the author of such a collection as this passes, at least in some degree, out of the province of the critic. *Arrows of the Chace* is a collection of Mr. Ruskin's letters *de omnibus rebus* to the periodical press and to private persons during the last forty years. Such things in everybody's case more or less, in Mr. Ruskin's case very much more, are informal expressions of the writer's personality rather than deliberate utterances of what he desires to communicate to the world. After the writer's death they are *publica materies*, open—in taste, if not in law—to whoever will to publish as side-lights on the character of their author. The consent and concurrence of which we have spoken relieve their actual editor, whoever he may be, of the charge of impertinence which would otherwise lie. And it may be presumed that the person principally concerned wishes them to be treated no otherwise than if that event, which we all hope may long be deferred, had actually occurred. Against the principle of such publications, indeed, it may still be permissible to register a faint protest, but the individual instance escapes, or almost escapes, censure. Mr. Ruskin tells us in his author's preface that all he feels inclined to do is to "pay himself some extremely fine compliments on the quality of the text." That is to say, he acknowledges his solidarity with that text; he has nothing

to withdraw, and nothing worth speaking of to correct. Therefore we are justified in dealing with the book as if it had appeared in the natural course of things, and in observing the principle, which is one of Mr. Ruskin's own favourites, *De mortuis nil nisi justum*, instead of the amiable convention which imposes in other cases.

Concerning the contents of the first volume, which is wholly given up to matters affecting art, there is likely to be comparatively little serious difference of opinion. A few points of detail may arouse a languid historical interest of a slightly polemical kind. But the paradoxes of one generation are—it is itself a commonplace—the commonplaces of the next; and such a collection as this would be sufficiently interesting if it did no more than supply a curious and interesting illustration of the fact. Some of the letters here reprinted, and bearing on the once hotly-debated question of the conservation of pictures in the National Gallery, have perhaps something more than a merely historical and illustrative interest, though the more important of their recommendations have long been carried out. Turner has, of course, a considerable section to himself; and the letter which Mr. Ruskin wrote to the late Mr. Walter Thornbury when he planned his life of the artist will always remain a testimony to what perhaps some people may think not Mr. Ruskin's strongest point—the power which he at one time possessed of seeing the defects as well as the merits of things and persons that he likes. The group of studies on John Leech, Ernest George, and Frederick Walker in the same way shows a catholicity which might also be denied to the author by hasty or second-hand judgments; while that headed "Architecture and Restoration" deals with a question which is still burning, and which therefore may have an additional interest for not a few readers. Of course, even in these art-letters the intolerance of the contrary opinion and the outrageous dogmatism which are wont to exasperate Mr. Ruskin's opponents make themselves to some extent felt. But in many of the points touched upon, time and the writer have proved themselves a match for any two, and possibly the undecided points may come to no very different settlement.

The most curious and important portion of the book, however, is, beyond all doubt, the second volume, in which the utterances of the author on all sorts of questions unconnected with art are, in accordance with his practice for the last twenty years, recorded. The strength and the weakness of his literary character and method are here made, not indeed clearer than they are already to the attentive reader of his multifarious books, but clearer than they can be to any one who has not gone through a complete course of the *opera* which are now so formidable in bulk and so inaccessible to the modest person who likes to have in the shelves of his own book-case the books which he likes to read. It is not an insignificant fact that the series opens in 1859. That year was notably the year in which Mr. Ruskin, quitting the province in which, after many battles, he had generally come to be acknowledged as a supreme authority, embarked on all sorts of alien speculations, in which he spoke, at any rate from his own point of view, with authority at least as great, though his most fervent admirers would hardly contend that he spoke with equal knowledge. A series of letters on the Franco-Austrian war opens the volume. In these epistles is at once apparent the curious confusion of view and the lamentable irrelevance of utterance which have since rejoiced Mr. Ruskin's enemies and given pain to his friends. A dim consciousness is visible in these letters—a very much clearer consciousness is visible in the subsequent but much more definite letters on the Danish war and the Jamaica Commission—that the *summa dias* of England for a time—let us hope not also the *ineluctabile tempus* for all time—had come. But Mr. Ruskin's deliverances, especially on the earlier quarrel, are such as it is impossible for any one to suppose likely to convert opponents, and such as would be very little likely to strengthen dubious friends. The merits of the Austrians and the French and the Italians are compared and set together from no general political or historical standpoints, but from purely private and *idiotic* standpoints. Mr. Ruskin has known several nice Austrians, and he says a good word for them. He is aware that Italy is the Mecca of his own particular faith, and he has a good word for the tribe of Koreysh. He thinks that the cession of Savoy is "only a fair day's wage for a fair day's work," and so he has nothing to say against that. He does not like the Papacy, and so he has a sneaking kindness for whatever tends to weaken the Papacy. So the letters remain cryptic and insoluble, presenting no resting-place for the foot of any one who is disposed to place his foot where Mr. Ruskin tells him to place it. Of directly political letters there are not many more here until we come to the famous Glasgow correspondence of the other day, in which Mr. Ruskin informed the world that "I hate all Liberalism as I do Beelzebub," and that "with Carlyle I stand, we two alone in England, for God and the Queen." Possibly Mr. Ruskin might have advantageously remembered a certain story of the Prophet Elijah, and have recognized the possibility of there being a few persons who have not bowed the knee to Baal besides the two illustrations of Brantwood and Cheynes Walk. Certainly he would by so doing have escaped the still more famous "Obesterfield letter" had he not written this. The spirit, however, is sufficiently obvious if only by degrees and in gradually increasing measure from the rather evil day when he first took to political economy and other political things. Very many of the epistles here reprinted appeared originally in the *Daily Telegraph*, a periodical for whose peculiar style Mr. Ruskin appears to have an inscrutable affection. To congratulate the *Daily Telegraph* on its admirable articles and

* *Arrows of the Chace*. By John Ruskin. Edited by an Oxford Pupil. 2 vols. Orplington: Allen. 1880.

to quarrel with the *Pall Mall Gazette* were apparently for a long time favourite occupations of his; and though most people have probably a dim remembrance of most of these communications, it is rather surprising to find how numerous they were between 1865 and 1875. One set of letters (which are, indeed, not new to us) we are extremely sorry to see reprinted, though they contain some good and sensible things. This is the set which, serving originally as a commendatory preface to a crotchety and rather unsavoury little pamphlet about the morality of schoolboys, contained an expression which gave deep, and we think just, offence to a very large number of readers. We are not disposed to perform memorial rites in honour of the late Mr. J. S. Mill. But every one, whatever his political, philosophical, or religious creed may be, must feel that to speak of the author of the *Logic* as "a poor cretinous wretch" is utterly indefensible, let who will have been the speaker. The admiring editor of these papers himself offers a kind of excuse and a very insufficient explanation of the outrage, but the cancelling of the phrase would have been the only valid apology. It would be idle to attempt, in a review of any moderate dimensions, to give an account of the farrago of topics treated here, and including almost as miscellaneous a collection as *For* itself. The reader may very likely generally be in sympathy with the view which Mr. Ruskin wishes to take, though he may often feel compelled to dissent very strongly from the actual positions advanced, and still more with the arguments used to support them. It is characteristic, for instance, that in Mr. Ruskin's onslaught on railway shareholders he uses the Post Office as a parallel, forgetting, or not caring for, the fact that the Post Office makes a handsome profit. To make a profit out of carrying passengers is abominable; to make a profit out of carrying their letters seems to be legitimate enough. But, then, we do not look for consistency in Mr. Ruskin, or, if we do, we certainly do not get it.

Therefore, to return to our beginning, these *Arrows of the Chace* ought rather to have been denominated *Boomerangs of the Chace*, for they almost invariably return and smite the bosom of the archer. They contain many *dicta* which are separately admirable as literature; and many which express the absolute truth on important matters of all kinds with consummate felicity,

τό δ' ὄνλον ἐπέυχεται εὐρεῖν Παῦρος.

Mr. Ruskin holds himself up boastfully as a Conservative of Conservatives; but it is questionable whether any one who, with a clear comprehension of history and human nature, sets himself to work to do his own little possible on the Conservative side of the great battle, will find in him a more satisfactory support than any one who is of the opposite persuasion, while the latter person will find innumerable handles for attack. The entire want of political perspective in Mr. Ruskin's political views, the inurbanity of his expression, the will-worship and crotchety of his attitude, make him rather more dangerous as an ally than as an enemy. He is generally right in principle, and perhaps in the majority of cases right in the particular applications which he makes of that principle. On the one subject where he speaks with sufficient knowledge—the department of art pure and simple—he seldom errs, or errs only by a pardonable exaggeration. But in every other department, and in the department of politics most of all, he speaks with a knowledge almost entirely insufficient, for the simple reason that he does not care to supply what he lacks. He is a prophet, and if the people will not hearken to the words of the prophet so much the worse for them. He tells us in his preface that he finds himself less copiously supplied with metaphor and simile than he did in his youth. Those who see in him a kind of literary guerilla on the right side, but constantly bringing the right side into discredit by his eccentricities, may wish that self-will had permitted him to recognize this deficiency in his chief methods of argument as a warning to cease arguing.

TEMPLE'S INDIA IN 1880.*

SIR RICHARD TEMPLE possesses two exceptional qualifications for the task which he has undertaken in interpreting India to English society. On the one hand, his experience is long and varied; on the other, he is an adept in the art of exposition. So far as Indian matters are concerned, no man has seen more, or knows better how to put the results of his observations into a form which an uninitiated reader will be able to understand. Indian officials are too frequently deficient in both respects. Each man knows well enough the details of the tiny segment of the huge administrative wheel in which his lot has been cast; but he fails to grasp its connexion with, and its relations to, the rest; and he is unable to communicate his ideas except to persons who have fathomed the meaning of technical words and phrases with which he has been all his life so familiar that the idea of their being unintelligible to the world at large never occurs to him. The consequence is that many a man whose knowledge might be of real value in the solution of difficult questions is, for all practical purposes, inarticulate. If he attempts to explain a subject to an outsider, he falls at once into technicalities which are simply bewildering, and unconsciously assumes knowledge on the part of his hearer when all is the blindest ignorance. A grim official joke has described such men as resembling the cuttle-fish, extruding an inky

fluid for the purpose of concealing their meaning; and it is certain that a lamentably large proportion of the huge mass of Anglo-Indian literature has tended, so far as the outside world is concerned, to intensify the obscurity of what was already sufficiently perplexing, and to deepen the despair of the enterprising intruder who might venture among the mysteries of Indian officialdom.

Sir Richard Temple is the exact opposite of this order of official. His employments have been so numerous and so varied that he has been forced to appreciate their relative importance and their connexion with one another and with the whole machine of Government; and, at the same time, to learn by practical experience how hopelessly unintelligible a special subject is to all but the specialists who have made it their particular study. The consequence is that he has produced a book in which the entire range of Indian administration is explored, and all the complicated structure of the various great State departments satisfactorily explained, but which is, at the same time, from first to last a triumph of lucidity. No one who chooses to read his volume attentively need be troubled any longer by the disagreeable consciousness that India and its affairs constitute a real "Asian mystery," which defies his best efforts at solution and plunges him, whenever any Indian topic presents itself, into bewilderment. The extravagant assertions and unsound inferences of writers like Mr. Hyndman, such crude proposals as those which the Government recently thought it necessary to expose and demolish in the case of Mr. Caird, and the monstrous blunders into which English politicians almost invariably fall when they take an Indian subject in hand, are really the necessary result of a great and difficult subject being allowed to remain imperfectly known and understood by those who feel called to think or speak or write about it. Yet it has been hitherto far easier to expose and denounce this inadequate knowledge and understanding than to point out any quarter in which trustworthy information might, without a disproportionate expenditure of time and research, be obtained. Colonel Chesney's admirable volume on Indian polity has now for more than a decade been the one standard authority on all questions relating to administration; but it deals with details, which only those immediately concerned in the government of the country would find interesting, and it has become to a certain degree obsolete from the fact that many of the reforms which Colonel Chesney recommends have been, since he wrote, carried into effect. Sir R. Temple writes evidently for a more general audience, and consults the tastes of a wider class of readers. Nothing apparently comes amiss to his inappreciable appetite for knowledge and the indefatigable zeal and interest with which he explores the wide field of observation which India opens to willing and well-instructed eyes. From finance to art, from Buddhist archaeology to projects of public works or agricultural education, from speculations as to the obscure past of primitive social forms or tottering creeds to descriptions of mountain scenery or sporting adventure—in all alike he is vivid, eager, intensely interested, and not a little pleased with the work which the English are effecting in the country. If any one wished for an explanation of the enormous revolution which the presence of Englishmen in India is effecting in the ways, thoughts, and beliefs of native life, he could not find it better set forth than in the vigorous, resolute, hopeful, and, on the whole, complacent spirit which breathes throughout Sir R. Temple's entire volume. He makes no secret of his belief in his country's destiny as the regenerator of Indian society and its pioneer to higher forms of national existence than any yet attained. He sees everywhere schemes of improvement patiently worked out to successful results, and he is naturally and justly more occupied with these results than with the occasional mishaps and mistakes by which they have been marred or by which their accomplishment has been delayed. He speaks with a caution and guardedness which contrast strangely with the violent confidence of less experienced and less responsible observers; but, as to the general result, he is unhesitating in his verdict that the British rule in India is efficacious for enormous good, and that such dangers as there are—dangers which are not to be ignored—may be met with confidence and hope. Misery, no doubt, there is, and must be, wherever a vast aggregate of 250 millions of human beings is exposed to the vicissitudes of an uncertain climate and to all the long list of calamities which afflict partially civilized communities. Disease, want, and death all operate with a potency which is shocking to the philanthropist and alarming to the statesman who fails to see in them the necessary concomitants of a rude and comparatively early stage of national existence, from which the human race can be rescued only by that gradual and often tedious process of general improvement which it has cost many centuries to accomplish in Europe, and which will certainly not be accomplished in India without the defeats and disappointments incidental to all human efforts. Meanwhile, it is reassuring to be told by so careful and experienced an observer as Sir Richard Temple that there are, after all allowance has been made for occasional miscarriage, substantial grounds for believing that the process is being hastened—so far as human skill and energy may suffice to hasten it—by the administrative measures of the Anglo-Indian Government and by the personal exertions of Indian civilians. Since Mr. J. S. Mill wrote his famous apology for the East India Company, nearly five-and-twenty years ago, no such forcible argument in favour of British rule has been adduced as that which Sir R. Temple's volume must present to every unprejudiced understanding.

It is a satisfaction to find that Sir R. Temple entirely confirms the view as to the finances of India which has been so frequently

* *India in 1880.* By Sir R. Temple, Bart., G.C.S.I., C.I.E. London: Murray.

maintained in these columns against those prophets of evil who found in the alleged bankruptcy of India a convenient topic with which to work on the feelings and arouse the alarm of an un-instructed audience. Speaking with the authority of an ex-Minister of Finance, and evidently with the sedulous accuracy which might be expected from such a witness, he adopts the conclusion that the revenues of India have, on the whole, since the Mutiny, more than sufficed to meet all its outgoings of every sort except the expenditure on Productive Public Works; that the interest on those works is more than covered by their net earnings; and that, owing to the increased profitability of their undertakings, and the improved credit of the Indian Government, the total annual charge for interest and public-works expenditure of every kind is considerably less now than it was ten years ago, notwithstanding the outlay of many millions of capital on railways and canals. One very ingenious calculation puts the effects of the Productive Public Works in a new and striking light. It has been contended, the writer says, by some critics of Indian finance, that the expenditure on these projects, whether in the form of guaranteed capital of the railways or direct outlay by the State, ought to be regarded as a part of the national indebtedness, and be added accordingly to the public debt. This way of stating the account, whether correct or not, would, Sir R. Temple points out, be highly favourable to the Indian Government. If the debt be taken at 149 millions, and the guaranteed capital at 97, the total on which interest is payable would be 246 millions. But, if the net earnings of the Public Works be deducted from the interest charge, the net interest payable would be 6½, 5½, and 4 millions for the years 1878-9, 1879-80, 1880-1 respectively, or at the rate of 2½ per cent. for the first of the three years, 2½ per cent. for the second, and less than 1½ per cent. for the third; in other words, the Indian Government has laid out 123 millions in the development of the country to such good effect as regards its own treasury as to reduce the rate of interest on its whole public debt below that of any other country in the world. Yet these are the works which Mr. Hyndman a year ago was denouncing as the "hare-brained projects" of reckless and self-opinionated officials, and which Mr. Fawcett congratulated himself and his supporters on having brought to a partial standstill.

It is impossible in the short compass of a review to do justice, even in the way of enumeration, to the topics with which Sir R. Temple deals, still less to the manly spirit of loyal enthusiasm, energetic zeal, and courageous hopefulness that characterizes his treatment of every one. In an age when patriotism is too often regarded as a foible, and when writers in magazines complacently demonstrate the inutility of England's maintaining her place among the great nations of the world, it is refreshing to meet with a writer proud of his country and of his countrymen, and of the great work which they are accomplishing in the East, deeply interested in showing how real and substantial that work is, and anxious to promote the calm and rational discussion of the means for its further advancement. Sir Richard Temple's name is already honourably associated with valuable official works, great administrative ability, and untiring zeal for the interests of the Government and the public; he has added to the long list of his public services by showing in a compendious and intelligible form what the British administration of India really means, and by enabling the world at large to form an intelligent estimate of the degree in which it can be regarded as successful, and of the means by which still further successes may be achieved.

DIMPLETHORPE.*

DIMPLETHORPE may be best described as a very pretty story. There is but a slight plot, as there are no strong sensations; and the scenes are entirely confined to a dead-alive little town in the Eastern counties, which lies aside from the busy highways of traffic, although within thirty miles of London. The characters lead singularly uneventful lives; the most dramatic circumstances in the hero's career consist in his rising steadily from the smallest beginnings to some reputation as an artist, under the patronage of kindly and appreciative neighbours; while the most formidable dangers to which his hopes and happiness are exposed arise out of a foolish, though mild, flirtation. But the story is told with a quiet simplicity which makes it agreeable, if unexciting, reading; and, in the limited range of life which she describes—we imagine that *Dimplethorpe* must be the work of a lady—the author gives proof of keen observation. All the people appear to be drawn closely after nature, although by no means servile copies of their originals; and there is generally a softness and harmony in the pictures of scenery and persons that impresses them upon the memory.

Dimplethorpe is mainly a love tale, but its hero is more human than romantic. Mr. Philip Hathaway, familiarly styled Phil by those who knew him best, though, upon the whole, a respectable and deserving young man, is by no means a model of heroic perfection. He is somewhat weak, though not wicked, and his head has been partly turned by his social success, while his vanity is very easily flattered. He had a precocious boyish fancy which, as we might have imagined, was intended to leave its mark on the whole of his life. In his attic, under the

humble roof of his grandfather the osier-weaver, he had ventured to lift a reverential pair of eyes to little Audrey Ferguson. Audrey, the daughter of his first patron and benefactor, seemed so far above the ragged little worker in the willow beds that it appeared almost sacrilegious in him to make prize of a bit of blue ribbon of hers, though it was to be treasured jealously as a relic. But Philip climbs the ladder, thanks to his artistic gifts and pleasant manners, till he gets on a level with the daughter of the Dissenting minister or passes her. Then his head is turned by the footing on which he is placed with his superiors; while his senses are intoxicated besides by a passing flirtation. It is true that he returns in the end to his first love; but he comes back not only in the character of a penitent, but to ask forgiveness for sundry offences which have been decidedly of the shabby order. Philip is none the worse artistically on that account; on the contrary, he is all the more lifelike. For his shortcomings are exactly those we should expect to find in the peasant *parvenu*, who, in spite of decided genius and a happy way of adapting himself to the habits of gentility, has rather more of the coarser clay than of the finer porcelain in his composition. What we feel is that, although he is to make his way in the world, and may die an Academician of considerable distinction, he is scarcely worthy of such a girl as Audrey Ferguson. He has succeeded, however, in inspiring her with a devoted attachment. It is true, indeed, that Audrey had no great choice of admirers in Dimplethorpe; and we know besides that fascinating women in all ages have lavished their love on undeserving objects. And we remember, moreover, that Audrey, like her lover, though in a different sense, has been slowly developing from the chrysalis stage into that of the full-blown butterfly. She was not one of those beautiful and lively-witted children who compel society in general to pet and spoil them by the sheer force of their brilliancy and good looks. When she stole into the heart of modest little Phil Hathaway, we are left to suppose that it was owing to his quick artistic perceptions, with some secret sympathy between their souls. She was a placid child, consistently "sat upon" and pushed aside by a bustling and notable mother, who, though she loved the quiet little girl in her own peculiar way, greatly preferred her more showy sister. But little Audrey is a born lady, which the other children in the minister's household are not. She has a more congenial companion and a good teacher in her henpecked, but clever and gentlemanlike, father; she is thoughtful, and educates herself by self-reflection; she is imaginative, and learns to elevate and refine herself in communings with her own graceful fancies. The progress of her development in its various stages is brought out with great skill and probability. For Audrey, although undemonstrative and disposed to be submissive, especially towards those to whom she has cause to be grateful, has an unsuspected strength of character which lends her dignity and presence of mind on occasion. Her behaviour to the vain and volatile Phil is very ingeniously conceived, because it is so true to what we find we might have expected of her, when we have come to know her as well as he will. So long as she fancies herself sure of his heart, she is docile and humble almost to self-abasement. She is ready to consider his humours, to make allowances for his foibles; she is fond and almost forward to a fault; and, in short, will persist in regarding him through a pair of love-tinted spectacles. She is very slow to suffer the truth to dawn upon her. But when at last she is compelled to realize that he is ashamed of her family, if not of her; that even as to herself he is shaken in his allegiance, and has probably a fancy that he might easily do better for himself, she is stung to the quick in her self-respect, and her maiden dignity is up in arms. Strengthened by the recollection of the humiliation which she has half invited, she has torn Mr. Hathaway from her heart, so far as all appearances go. She has left her birthplace and all her friends, and gone to take up her residence in London. When she subsequently meets her former lover on her flying visits to Dimplethorpe, she makes no sign in answer to advances which are at first assured, and afterwards humble. Yet it turns out, when we come to the explanations and the reconciliation which we see all the time to be inevitable, that Audrey had only taken to flight in the consciousness of her own weakness. She knew well that she was passionately in love with Phil, and she feared she might have betrayed herself, had they been in the habit of meeting. The protracted separation under such painful and doubtful circumstances has purified and strengthened her nature and made her still more valuable as a prize to be won, while Phil's somewhat tardy display of constancy has thus brought him a double reward. He receives the precious pledges of Audrey's affection, while, as for himself, he has been driven to go through a discipline of humiliation and self-denial which he sorely needed, and which will probably prove the making of him. So the first acts of the love-play come to a close with a reasonable prospect of their wedded happiness.

Phil and Audrey are always in the front of the stage, filling the leading parts, as they ought to do. But the author has by no means concentrated her attention on them to the exclusion of subordinate persons. Audrey's mother, Mrs. Ferguson, is excellent in her way; and, if she fills her station as a wife and housekeeper with credit, is the very woman to make an uncongenial home for so refined and retiring a girl as the eldest daughter. Of course a residence under Mrs. Ferguson's roof would be intolerable to any quiet young man of delicate feeling; and we can sympathise with Hathaway's declining to take lodgings there, even when he professed to be "keeping company" with Audrey, and ought to

* *Dimplethorpe*. By the Author of "St. Olave's," &c. London: Hurst & Blackett. 1880.

have been delighted to be so near the young lady. We feel sincere sympathy with the worthy Mr. Ferguson, who must have had bitter cause to regret a precipitate and unsuitable marriage; we experience a wicked satisfaction when the crushed worm turns, and when he insists upon extending his protection to Phil Hathaway, in the face of his wife's remonstrances and commands; and when at length he is gathered to his fathers, we are sure death must have been a blessed release for him. Nevertheless, Mrs. Ferguson is not a monster, nor are we permitted to dislike her so much as we are disposed to do. For, although she has no refinement of feeling, she has a good heart, and she shows strong, though perverse, motherly instincts when she thinks that Audrey, who, after all, is her child, is being "put upon." Had there been any excuse for Phil's playing fast and loose with his engagement, it might have been found in the prospect of Mrs. Ferguson for a mother-in-law; nevertheless, for once we appreciate that lady's coarseness and bluntness when she very frankly gives a piece of her mind to that spoiled young "beggar on horseback." In striking and effective contrast to the Dissenting minister's wife is Miss Burnaby, a warm-hearted, elderly spinster, who, as she has taken Phil Hathaway by the hand, has also done much towards forming Audrey. Miss Burnaby, a polished, somewhat formal, but free-spoken lady of the old school, lives with that veteran bachelor, her brother the General, in an old-fashioned manor house in the outskirts of the town. After having rejected various matrimonial offers, more or less ineligible, she does not yet deem herself beyond the age of being made love to by some well-mannered, well-connected gentleman of respectable years and position. So she feels all the deeper personal interest in the worrying love affair of her favourite Audrey; and, using the privilege given by the many kindnesses she has bestowed upon Phil, even Mrs. Ferguson herself could hardly be more candid in setting his iniquities and follies before him when he has been gradually estranging himself from Audrey and been made a fool of by a coquette of fashion; the difference being that Miss Burnaby lectures like a lady, while the minister's wife "flies out" like a scold; and the discrimination between their different styles of invective is nicely indicative of their respective characters and positions. But there is always shrewd discrimination, and generally subdued humour, in all the people whom the author introduces, even in such serious-minded gentlemen as the lamented Mr. Ferguson, who, as we are perpetually reminded, might have been a happy man had he remained a bachelor or been more fortunately mated.

AMERICAN LITERATURE.

THE annual Report on the currency (1) presented to Congress at its meeting in December is of more than usual interest. The reduction in the rate of interest upon which the Comptroller dwells is already familiar to our readers; what may not be equally well known is the strange variation of the rate between different periods of the year and different localities. At one time it was possible to obtain money at call in New York upon the best securities at something less than three per cent.; but the rate latterly has been four to four and a half for first class mercantile paper. It is strange in the face of such a fact to find how greatly the rate is increased by comparatively short distances from the central market. At Boston and Baltimore—cities occupying in the United States the commercial position of Liverpool or of Glasgow—the average has been five, at Washington seven, at St. Louis—the Manchester or Birmingham of the West—from five to seven; at Cincinnati, a day's journey eastward of St. Louis, from six to seven; at St. Paul and Omaha from eight to ten; in the South, from seven to ten per cent., except at New Orleans, where it has been but little higher than at Boston. It is curious to find how little public confidence in paper has been shaken by the prolonged depression of the Treasury notes after the war, following as it did upon a still longer period when paper money issued by all sorts of banks had a value uncertain and various in the extreme. Such is the reliance of the people upon the good faith of the Government and the security of their present banking system, resting as it does mainly upon Government credit, that paper is actually preferred to gold or silver, except for purposes of hoarding. The quantity of money hoarded, especially by negroes in the South, is reported to be very large, though upon this point the Comptroller offers no distinct information. It is perhaps due to the preference for paper as the more convenient form of currency that the Silver Coinage Act has done so little harm. On the natural mischief of that measure the Report has some strong and sensible remarks. Everything, we are told, is at present favourable, but the tendency of laws now in force is to continually reduce the amount of gold, and increase that of silver, held by the Treasury. In trying to force silver upon the holder of maturing bonds or of legal tender notes presented for redemption, the Government might any day substitute silver for gold as the practical money standard, which would at once enhance all prices, and raise gold to such a premium that, as the Comptroller holds, an investment therein at par would be at least twice as profitable as in United States bonds. The inconvenience and peril of such a situation need no comment. Another interesting public document is, as usual, the Report of the Massachusetts Board of Education (2). The taxation in that State is a subject upon which the Comptroller of the Currency to Congress, December 22, 1880. Washington: Government Printing Office. London: Trübner & Co. 1880.

(3) Forty-third Annual Report of the Massachusetts Board of Education, 1876-79. Boston: Rand, Avery, & Co. London: Trübner & Co. 1880.

State for the support of public schools exceeds eight hundred thousand pounds sterling; the aggregate expenditure, exclusive of the expense of repairing and erecting school-houses and cost of school-books, is nine hundred thousand. We may recommend to the especial attention of those interested in the subject that part of the Report which deals at some length with the condition of the institutions for the education of deaf mutes, partly supported by the State, partly by public and private endowments. Two other characteristic State Papers deal, the one with foreign systems of naval education in general (3), the other with the special training of seamen in England and France (4), chiefly with the training-ships of the two countries. The latter gives high, but, we believe, only deserved, praise to the training-ships for the Royal Navy under the control of the British Admiralty as far surpassing in results, and at no unreasonable cost, any of their rivals or competitors.

The biography of Governor Andrew (5), of the State of Massachusetts, has the merit of moderate length which is so rare in American memoirs. Mr. John A. Andrew was not a very prominent figure among the American statesmen of his day; but he commanded a degree of respect and confidence in his own State which many more active and generally better known personages failed to obtain. His absolute integrity, personal and political, was beyond question; a certain simplicity, accompanied, as is not unfrequently the case, by a peculiar willfulness upon a few special subjects whereon his convictions were too deeply rooted in his individual personality to be affected by reasoning or by authority, no doubt added to the charm he appears to have exercised over many of those who came into personal contact with him and to his popularity with his neighbours and constituents. During the war of secession, wielding the power of his State, he exercised a greater influence than is generally known, the more, perhaps, on account of a certain similarity of temper which brought him into sympathy with President Lincoln rather than with the more practised and cultivated statesmen who surrounded him. The constitutional loyalty of Governor Andrew was as unimpeachable as his political sincerity. The first half or two-thirds of his biography will be found to be well worth reading, and to make no unreasonable demand on the leisure even of an English student of American politics. The rest of the book is filled up with addresses, orations, and memorial speeches, which no one except the immediate constituents of Governor Andrew will, we think, now care to preserve.

The Life of Dr. Hodge (6), Professor in the Theological Seminary at Princeton, New Jersey, a gentleman as much inferior in importance and in the popular interest of his life to Governor Andrew as the latter was to President Lincoln or Mr. Seward, occupies six hundred closely printed pages, containing at least ten times as much matter as the biography of the Governor. It is possible that, despite its extravagant length, the book may be attractive to some of Dr. Hodge's co-religionists, but the contrast presented by the two works is certainly instructive; we wish it could be hoped that American biographers in general would profit by the example. The memoir of the practical statesman tells all that the world can care to know about one who really affected the fortunes of a great nation at the greatest crisis in its story. The elaborate account of the professor contains an enormous mass of letters and memorabilia of no interest whatever to any but his own immediate family and *entourage*; and all that was worth recording for the information of the public might have been compressed into fourteen of the 140 modest pages devoted to the story of the simple straightforward man who ruled the Puritan commonwealth during three or four critical years.

The memoir prefixed to the household edition of Poe's works (7) is considerably longer than that last-mentioned, though it contains not a fourth part of the matter or rubbish with which the biography of Dr. Hodge has been padded. Here, again, proportion has been well observed. No one will think 200 octavo pages too much for a really new and thoughtful biography of one of the most interesting personalities in the history of American literature. Mr. Stoddard endeavours to do true justice to the memory of his subject, differing almost as widely from the eulogistic tone of his recent defenders as from the spiteful and malicious temper which appears to have animated his original biographer. That Poe was perfectly innocent of many of the sins ascribed to him by the latter, has, we think, been made clear beyond question. That his career, hard and difficult as it was, was ruined rather by his own weaknesses than by the harshness of others, Mr. Stoddard, has, we think, sufficiently established. Poe's was one of those peculiar temperaments upon which certain common temptations act with especial force, but which cannot yield to them without paying a penalty more immediate and far more terrible than much greater vice, much more

reckless indulgence, entail upon less sensitive organizations. Mrs. Stowe has done some service, despite her deliberate malignity and wanton or reckless injustice to the memory of Byron, by showing how fatally his education and circumstances exposed him to the temptation of indulgence in wine, and how fatal that indulgence was to his peculiar temperament. Poe more resembled Shelley than Byron in the delicacy alike of his organization and of his fancy. Unfortunately he had Byron's susceptibility to temptation without Byron's physical energy and recuperative powers. He was tried far more sorely than, but for his own youthful errors, Byron ever need have been; he was almost driven to the consolation which ever tells with most terrible effect upon such natures as his; and excesses which might hardly have injured an ordinary man seem to have ruined alike his physical health and his intellectual power. The more carefully we study his story, as told by various writers from the most different standpoints, the more we find one and the same inference forced upon us. Gifted with very extraordinary and exceptional powers, but powers strangely and somewhat narrowly limited in their sphere, Poe might under favourable circumstances have been a great and a happy man. Happy, indeed, for a short time, even under very severe trials, he seems to have been. With less marvellous intellectual gifts, and a somewhat stronger self-control—his power of will for some time and in certain directions was very exceptional—he might have been a distinguished and a useful citizen, a contented and dearly loved husband and father. He was placed in circumstances most certain to bring out the weak points of his character, he was tried by afflictions beyond his strength, and he yielded to temptations which had for him in such afflictions an almost irresistible attraction. No thoughtful reader, we think, will close Mr. Stoddard's memoir without the profoundest pity and sympathy for its subject, without a somewhat bitter and angry contempt for those who have presumed to judge or to blame him.

Mrs. Weitzel's *Sister and Saint* (8) is what she modestly calls it—a sketch, and no more—but a sketch of a life which cannot be touched even in outline without exciting interest and sympathy, if not precisely of that sort that a fuller study of her subject has called forth in the authoress herself. The character of Jacqueline Pascal was one of those truly feminine characters which few, whether men or women, can observe even across the distance of generations without being touched by its sweetness and gentleness, and interested by the earnestness and sincerity of its self-devotion. But her career will seem to most English readers a complete mistake, and a mistake due to her weaknesses, amiable and womanly as they were, rather than to her not less striking virtues. Her connexion with her eminent brother and with the society that gathered round Port Royal gives its chief interest to the story, and has enabled Mrs. Weitzel to enhance that interest by sketching more than one of the characters with whom her heroine was brought into contact. Mrs. Van Chenoweth's *Stories of the Saints* (9) is a work of altogether inferior quality. It seems a mistake fatal to the whole purpose of the book to mix up the legends of champions like St. George, St. David, and St. Denis, with poetic stories like that of St. Christopher, with real characters like those of St. Catharine, St. Francis of Assisi, or St. Elizabeth of Hungary, and St. Patrick.

We have two works on the theory of evolution written from exactly opposite standpoints, and each calculated to excite in readers at all familiar with the subject, and not very deeply prejudiced on either side, a feeling of antagonism rather than of disposition to agree with the conclusions of the writer. Mr. Mott answers the question "Was Man Created?" (10) in the Darwinian sense with a confidence which, we think, Mr. Darwin himself would pronounce to be altogether exaggerated. Mr. Mott's book, despite the curious information it contains and the minuteness and clearness with which, both in the text and the illustrations, the supposed descent of man is traced to the Ascidian or to the primitive protoplasm through every one of the supposed links, can only tend to mislead a reader who takes it up without having first carefully studied all that Wallace and Darwin have written, and something also of what adverse critics have had to say upon the subject. Professor Chapin deals with the same question from a theological point of view (11). That the quarrel between Cain and Abel represented the contest between nomad and agricultural races or impulses, that the first murder represents the victory of a higher over a lower civilization, and that Cain, in short, was the primeval benefactor of mankind, and the founder of arts and author of social development, may be news to the orthodox world, outside, at least, of the congregation to which Dr. Chapin dedicates his volume.

Mr. Coffin's narratives of old colonial days (12) deal with times and topics that have furnished material for elaborate histories, for school abridgments, for collections, anecdotic, bio-

graphical, and legendary, for grave lessons and exciting stories, to innumerable American authors. There is nothing with which Americans are from childhood made so familiar; no subject perhaps in the world upon which so little truth has been told, upon which such innumerable fictions are universally current, except the history of English rule in Ireland, and indeed of Ireland generally. That the colonists, especially of New England, were all saints and heroes is a part of the received creed of every American schoolboy and schoolgirl. It follows consequently that all their enemies, Indians, French, English, all with whom by their own act or that of others the Pilgrim Fathers and their friends came into collision, were cowards, savages, brutes, and fiends. In this respect Mr. Coffin's book is not very much better or very much worse than the average of its competitors. No one who reads between the lines will be likely to find any strong sympathy for the men who, after murdering hundreds of Indian women and children, often burning them to death by surprise when they stormed and fired an undefended village, came home to dwellings in ashes, to find their own wives and children dead or captive. The savage brutality of the American Puritans truthfully told would afford one of the most significant and profitable lessons that history could teach. Champions of liberty, but merciless and unprincipled tyrants, fugitives from persecution, but the most senseless and reckless of persecutors; claimants of an enlightened religion, but the last upholders of the cruel and ignorant creed of the witch doctors; whining over the ferocity of the Indian, yet out-doing that ferocity a hundredfold; complaining of his treachery, yet, as their descendants have been to this day, treacherous with a deliberate indifference to plighted faith such as the Indians have seldom shown—the ancestors of the heroes of the revolutionary and of the civil war might be held up as examples of the power of a Calvinistic religion and a bigoted republicanism to demoralize fair average specimens of a race which, under better influences, has shown itself the least cruel, least treacherous, least tyrannical of the master races of the world. We do not say that this picture would not be a one-sided one; we do say that it would show a side which hitherto has been studiously concealed, and that side by side with the descriptions of Mr. Coffin and his thousand congeners it might give the Americans of to-day a fair idea of the Americans of two hundred years back.

No such exception can be taken to Mrs. Arr's graceful, homely, quiet sketches of old-time childhood life (13). The only fault we need find with this relates solely to the title. There is less of the author's own child-life than of the people she knew in childhood and the scenes with which she was then familiar, described from the standpoint and in the tone of middle life.

General Brisbin's *Beef Bonanza* (14) is a lively, practical, but very readable, sketch of the life and prospects of a cattle-breeder on the plains of the Far West. Some of his facts are a little startling. It is difficult, for instance, to believe even on his assurance that a little more than a square mile of pasture will support a herd of four hundred cattle with their young in a climate where stall feeding is recommended for at least two months of the year, and where hay is the only winter food. Mr. E. H. Leland's *Farm Homes* (15) is a manual of house-building, house-furnishing, and house-keeping on American farms, from the first breaking of the sod to the cooking of the last thanksgiving feast.

(13) *Old-Time Child-Life*. By E. H. Arr, Author of "New England Bygones." Philadelphia: Lippincott & Co. 1881.

(14) *The Beef Bonanza; or, How to Get Rich on the Plains*. By General J. S. Brisbin, U.S.A., Author of "Life of General Grant," &c. Illustrated. Philadelphia: Lippincott & Co. London: Sampson Low & Co. 1881.

(15) *Farm Homes, In-doors and Out-doors*. By E. H. Leland. Illustrated. New York: Orange Judd Co. London: Trübner & Co. 1881.

NOTICE.

We beg leave to state that we decline to return rejected Communications; and to this rule we can make no exception.

(12) *Old Times in the Colonies*. By Ch. C. Coffin, Author of "The Boys of '76," &c. Illustrated. New York: Harper & Brothers. London: Sampson Low & Co. 1881.

ADVERTISEMENTS.

THE GROSVENOR GALLERY.

WINTER EXHIBITION.

The GROSVENOR GALLERY Exhibition of Water-Colour Drawings, and Decorative Designs, by living Artists, NOW OPEN Daily, Ten to Six.

Admission, 1s. Season Tickets, 5s.

DORÉ'S GREAT WORKS, "CHRIST LEAVING the PRÆTORIUM," "CHRIST ENTERING JERUSALEM," and "MOSES BEFORE PHARAOH," each 35 by 25 feet; with "Dream of Pharaoh's Wife," "Christian Martyrs," &c. at the DORÉ GALLERY, 55 New Bond Street. Daily, Ten to Six. 1s.

BRITISH MUSEUM.—The BRITISH MUSEUM will be CLOSED from the 1st to the 7th of February, both days inclusive. (Signed) EDWARD A. BOND, Principal Librarian. British Museum, January 29, 1881.

ROYAL AGRICULTURAL COLLEGE, CIRENCESTER.

For the Science and Practice of Agriculture. For intending Land Owners and Occupiers, Land Agents, Surveyors, Colonists, &c. The R.A.C. Farm, surrounding the College, is a mixed farm of about 500 Acres. *Chairman of Committee of Management.*—The Right Hon. the Earl of DUCIE. For Prospectus of College and Farm, List of Scholarships, Prizes, Diplomas, &c., apply to the PRINCIPAL.

THE Misses A. & R. LEECH'S SCHOOL for LITTLE BOYS will RE-OPEN on Tuesday, January 25, at 65 Kensington Gardens Square, Hyde Park, W.

LEAMINGTON COLLEGE. The NEXT TERM begins January 24th. Scholarships lately gained at Balliol, Queen's, Clare, Trinity Hall, Proxime for the Hertford. Twelve Certificates in July last in Public Schools Examinations. In the Junior School Boys are admitted at the age of Eight, and are prepared for Scholarships in this and other schools. Special attention paid to the elementary instruction of little boys. Apply, Rev. Dr. WOOD, College, Leamington.

ISLE OF WIGHT PROPRIETARY COLLEGE, Limited.—Head-Master, the Rev. F. D. TEESDALE, M.A., Scholar of Winchester and New College, Oxford, late Head-Master of the Northern Counties College, Inverness. The SPRING TERM will commence on Friday, January 29, on which day it is expected that all boys will be at the College at 9.30 A.M. All particulars may be obtained from the Secretary, T. R. OWAN, The Cottage, Melville Street, Hyde.

S. PAUL'S SCHOOL, STONY STRATFORD.—Warden, the Rev. H. W. MCKENZIE, Kiche Coll., Oxford, late Sub-Warden of S. Paul's. A PUBLIC SCHOOL, in accordance with Church of England Principles. Terms, Sixty Guineas. Full particulars on application to the WARDEN. The NEXT TERM begins January 19.

STRATFORD-ON-AVON.—TRINITY COLLEGE SCHOOL. The Warden, RICHARD F. CURRY, M.A., is assisted by Seven Resident Graduate Masters. Special attention paid to Modern Languages, Classical and Modern Studies, Junior Department for Young Boys. Exhibition to the University. Large Playing Fields, Gymnasium, Five Courts, &c. Terms, 50 and 60 Guineas. Apply to the WARDEN.

WOOLWICH, SANDHURST, and CIVIL SERVICE.—Rev. Dr. HUGHES (Wrang. Cant.), who during 15 years has passed nearly 400 Pupils, PREPARES Twelve for the above. Individual attention. Large House.—Ealing, W.

ST. EDMUND'S COLLEGE, SALISBURY.—A HIGH-CLASS SCHOOL for SONS of GENTLEMEN. The religious training is upon definite Church principles. Boys are educated with much care and thoroughness. They receive individual teaching and help wherever needed. Candidates for Matriculation at the Universities are specially prepared. Terms, 175 a year.—For references, prospectus, or any further particulars, apply to the Warden, Rev. G. H. BOURNE, D.C.L.

STIFFORD'S BRIDGE, MALVERN.—Thorough PRIVATE TUITION, in a large country house, is offered on moderate terms to a few GENTLEMEN'S SONS willing to read. Address, J. C. GAWTHORNE, M.A. Oxon.

CARSIALTON HOUSE SCHOOL, Surrey.—BOYS carefully prepared for Civil and Military Examinations.

FOLKESTONE.—Mr. W. J. JEAFFRESON, M.A. Oxon., assisted by a Cambridge M.A. and competent Teachers, prepares PUPILS for the Universities, Woolwich, Sandhurst, and all Competitive Examinations. A few Vacancies.

FRANK COOPER, M.A. Oxon. prepares a few PUPILS for the Public Schools. The House, expressly enlarged, stands close to the sea, on gravelly soil, between Bournemouth and Lymington. References given and required.—Address, Kiveralls, Millford, Lymington, Hants.

ROYAL ARTILLERY.—Rev. C. B. DRAKE, M.A., is able to offer to CANDIDATES for WOOLWICH the special advantages of residence at Cambridge. Home life. Numbers strictly limited.—Address, 19 Queen Anne Terrace.

ROSSALL SCHOOL.—MATHEMATICAL MASTER-SHIPS.—TWO will be VACANT at or before Easter. Candidates (who must be Wranglers, or First-class-men in Mathematics) should apply to Rev. the HEAD-MASTER, Rossall, Fleetwood.

WANTED, by the DAUGHTER of a CLERGYMAN, a situation as RESIDENT GOVERNESS. Has had previous experience in private tuition, and can give the highest instruction in French, English, French (acquired in Paris), German, Drawing, Painting, Music, and the Rudiments of Latin.—Address, 7, B. 41 Chester Square, S.W.

RESIDENT GOVERNESS.—Mrs. GEORGE A. SPOTISWOODE most highly recommends a FRENCH-SWISS GOVERNESS for Pupils above Ten; teaching advanced French and English and Elementary Drawing. Salary, 470s.—Apply 3 Cadogan Square, S.W.

TO BE LET, with immediate possession, 55 LOFTUS ROAD, Uxbridge, near Shepherd's Bush, W. Within a few minutes' walk of the Metropolitan and London and North-Western Stations. The House, which has just undergone complete repairs, contains Ten good rooms, and is well arranged as to domestic offices, with good garden at the rear overlooking fields.—Apply to Mr. J. BOARDMAN, Builder, 9 Pleasant Place, Uxbridge Road, W.

JEWELS.—SALES by AUCTION

DIAMONDS. THREE DAYS IN EACH WEEK at
WATCHES. DEBENHAM, STORR, & SONS'
CHAINS. GREAT AUCTION MART,
SILVER. KING STREET, COVENT GARDEN, W.C.
PLATED WARE. Large or Small Consignments included in
CLOCKS. forthcoming Sales on a short notice.

SUNNINGDALE, BERKS.—DALE LODGE.—This FREEHOLD ESTATE of about Three Acres to be SOLD or LET on LEASE. The House has every accommodation for a Family, is delightfully situated in this beautiful and healthy locality, with charming views. There are Coach-houses, Stabling, Gardener's and Coachman's Cottages, &c. &c. About half a mile from the Railway Station, and the same distance from one of the entrances into Windsor Park. Full particulars to be obtained from Wm. Sizer, Esq., 1 Dance Inn, Strand.

HOTELS.

BRIGHTON.—BEDFORD HOTEL.—Facing Sea and Esplanade. Near the West Pier. Central and quiet. *Long established. Rates of Rooms. Spacious Coffee-room for Ladies and Gentlemen. Sea-bath adjacent to the Hotel.* BENJN. BULL, Manager.

HYERES, VAR.—HÔTEL de L'ERMITAGE.—Warm and well-sheltered position in the Pine Woods. Magnificent views. Drawings and stair-rooms full south. Billiards, Lawn Tennis. Visitors will find every comfort in this establishment. English management. Omnibus at the station. Hôtel des Princes, nearer the sea, same Proprietor.—A. FAYROT.

BOOK and MAGAZINE PRINTING.—UNWIN BROS., the Printers of Six and twenty various Serial Publications, furnish Estimates on application. They have large premises both in London and Chisworth, Stereotype Foundry, and every Modern Appliance for the production of High-class Work in Modern or Old Style.—Address, 100A, Cannon Street, E.C. Telephonic communication with upwards of 700 Firms.

JOHN MITCHELL'S PENS possess a smoothness, firmness, and durability of point unequalled. Established 1822. MAKER of THE QUEEN. Through all Stationers. Wholesale and retail, 118 Chancery Lane, London, and Newhall Street, Birmingham.

FURNISH YOUR HOUSE or APARTMENTS THROUGHOUT on MOEDER'S FIRE SYSTEM. The original, best, and most liberal. Cash Prices, no Extra Charge for time given. Large, useful Stock to select from. Illustrated price Catalogue, with Terms, post free.—340, 349, and 350 Tottenham Court Road, and 19, 20, and 21 Morwell Street, W.C. Established 1827.

DECORATION.

MORANT & CO., having for many years carefully studied the best periods of Decorative Art, and having had great experience in carrying out important orders, will advise upon the DECORATION and FURNISHING of TOWN and COUNTRY HOUSES, prepare Designs, and execute the necessary works at moderate cost. MORANT & CO. personally superintend all work entrusted to them.

91 NEW BOND STREET, W.

PICTURES, BRONZES, and WORKS of ART on SALE at 30 Southampton Street, Strand. Pictures Cleaned, Lined, and Restored, if in the worst condition. Frames Cleaned or Regilt equal to New. Sales attended on Commission. CHARLES DEAR, 30 Southampton Street, Strand.

EPPE'S CHOCOLATE ESSENCE.—Product of a special refining process. It is Chocolate devoided of its overrichness and substantiality. Sugarless, and when made of the consistency of Coffee. An afternoon Chocolate. Each Packet (6d. or 1s.) or the 6d., 1s., 4d., 2s., 6d., 1s., or 7s. 6d. is labelled "JAMES EPPE & Co., Homoeopathic Chemists, London."

APOLLINARIS

"THE QUEEN OF TABLE WATERS."

Annual sale nine millions.

"Of great value to the cause of temperance and good health."

Dr. NORMAN KERR.

THE APOLLINARIS COMPANY, LIMITED,

19 REGENT STREET, S.W.

GRANT'S MORELLA CHERRY BRANDY. Have you ever tasted it? The most delicious liqueur for the world. Nee with hot water, or aerated waters.

GRANT'S MORELLA CHERRY BRANDY. Obtained at all Refreshment Bars, all Restaurants, Inns, Hotels, and of all Wine Merchants.

GRANT'S MORELLA CHERRY BRANDY. The most wholesome of all stimulants. A valuable tonic. See Medical Testimonials.

GRANT'S MORELLA CHERRY BRANDY. Is used in place of Wine. The Sportsman's and Traveller's Companion. Retained in the Army and Navy.

GRANT'S MORELLA CHERRY BRANDY. Supplied to the Queen at all the Palaces. To the Governor-General of Canada. To the Aristocracy and general Public.

THOMAS GRANT, The Distillery, Maidstone.

HUNYADI JÁNOS

"The richest natural Aperient Water."

Baron LIEBIG, in "LANCET."

"Speedy, Sure, and Gentle."

Professor ROBERTS, M.D., F.R.C.P.

"Invaluable for persons of sedentary pursuits."

LONDON MEDICAL RECORD.

The name of the "APOLLINARIS COMPANY, LIMITED," on the Label secures genuineness.

Of all Chemists, at 1s. 6d. & 2s. per bottle. Ordinary Dose, a wineglassful.

DINNEFORD'S MAGNESIA.—This pure Solution is the best remedy for Acidity of the Stomach, Heartburn, Headache, Caut, and Indigestion.

DINNEFORD'S MAGNESIA.—The Safest and most gentle Aperient for Delicate Constitutions, Ladies, Children, and Infants. OF ALL CHEMISTS.

THE CLOTURE.

SELDOM during the present generation has more interest been felt in the proceedings of the House of Commons than during the present week, and never, perhaps, has that interest been rewarded by proceedings of a more dramatic nature. A forty-one hours' sitting, an intervention of an unprecedented character on the part of the **SPEAKER**, a proposal revolutionizing the system of legislation and of a kind entirely new in the long and eventful history of Parliament, and finally the successive suspension of nearly enough members to make an ordinary House, make up a sufficient list of important occurrences, while the detailed chronicle of the week offers not a few other subjects for reflection and criticism. The conduct of the Government is naturally the first of such subjects, for of the conduct of the chief disturbers there can be only one opinion, especially after the exaggerated and melodramatic violence of their behaviour on Thursday. In the difficult circumstances in which Mr. GLADSTONE and his colleagues were placed great allowance must be made for them; but exception may fairly be taken to much of their conduct, both in action and in abstaining from action, during the debate, and certainly it may be taken to the remedy they proposed to apply to the evil which has now reached such an unbearable height. It is noteworthy that the task of vigilantly watching offenders and of invoking the terrors of the **SPEAKER** upon them was for the most part left to the Opposition leaders. When, owing to the unfortunate indecision of Dr. PLAYFAIR, the efforts of Sir RICHARD CROSS and Sir STAFFORD NORTHCOTE were frustrated on Tuesday night, it was with the utmost difficulty that the Government, in the not very effective person of Mr. CHILDERS, could be got to support these right honourable gentlemen; while afterwards Mr. BRIGHT seemed to take a pleasure in announcing that the Government way of dealing with the matter was something quite different, and that in this case, at any rate, they did not intend to be content with "the ordinary law."

It is no secret that some of the forward party in Parliament and in the Cabinet are extremely anxious for the cloture pure and simple, and it is natural that they should be so. They find themselves, or think themselves, to be in a great majority of the present House, and their chief speakers and organs avow, with some simplicity, their intention to make it impossible for such a misfortune to befall the country as the translation of their majority into a minority. That is to say, when this troublesome Irish business is finished, the franchise and the constituencies are to be manipulated so as to give to the Radical party as long a lease of power as may be practicable. This intention at once makes them anxious for the cloture and free from any anxiety as to its application. The cloture would help them to pass the measures which would make it extremely unlikely that it could soon be used against them. Now the opposite party would fully deserve the famous attribute of stupidity if they were not quite aware of these facts, and a disinclination to offer their own throats to the knife is very obvious among them. It has been openly said, and some journals which might be expected to be more thoughtful have echoed the saying, that if the Opposition had opposed the cloture, or the modified form of it which the Government propose, the responsibility of encouraging obstruction would rest with them. That this is wholly unjust

the demeanour of the Conservatives during the forty-one hours' debate, and the cordial support given to the Government and the Chair on Thursday, abundantly showed. With insignificant exceptions they refrained entirely from contributing to the mis-called discussion; but their leaders, as has been said, matured, and, but for the half-heartedness of the Government and the faint-heartedness of the **DEPUTY SPEAKER**, would have carried out, a plan which would of itself have sufficed to vanquish Mr. PARNELL and to render obstruction of the merely wanton kind extremely unlikely in the future, while it would not endanger the just influence of a large and respectable minority. The plan which Sir RICHARD CROSS, Sir STAFFORD NORTHCOTE, and Mr. W. H. SMITH pursued, which was defeated by Dr. PLAYFAIR, and the efficacy of which was abundantly shown on Thursday night, cannot be abused, because the debate must have continued for a considerable time, and the evidence of obstructive conspiracy must be clear, and must have accumulated largely, before it can be applied. Now the cloture, or the declaration of urgency, unless it be so carefully guarded as to be scarcely effective, is a weapon eminently susceptible of abuse. What is especially repugnant in the cloture and similar plans to English Parliamentary procedure is the necessary stipulation of a certain number by which they must be carried, and the consequent recognition of a mere brute majority as the deciding power, not merely in the last resort, but in the first. It cannot be too often repeated that it is not because the Irish members are few that their obstruction is regarded as indecent, but because they have absolutely nothing in the way of argument to bring forward for themselves. It is the manner and machinery, not the fact, of their resistance which is disgraceful and intolerable. Now the contrast between the plan which the Government wishes to apply and the plan which the Opposition endeavoured to pursue is just this, that the latter deals with the manner of resistance, the former with the fact only. Unless a speaker, or number of speakers, are clearly convicted of obstruction for obstruction's sake, he and they cannot be silenced as Mr. PARNELL and others of his band in rapid succession would have been silenced but for Dr. PLAYFAIR. There are moments when a bare substantive majority of the whole House, still more a two-thirds majority, or three-fourths of members present, might be sufficiently intoxicated by party zeal to stop the mouths of their opponents in the teeth of right and justice. But, even though the House be not what it was, it is to be hoped that there are few moments in which the **SPEAKER** could be induced to detect, or the House to recognize, evidence of deliberate obstruction, where such obstruction clearly did not exist.

The events of Wednesday morning and Thursday night, and the motion of Mr. GLADSTONE for the committal of extraordinary power to the Speaker under certain limitations, can only strengthen the regret which must be felt that the method previously suggested by the Opposition leaders was not carried out. That method having been declined, there was probably nothing to do for the time but to act as the **SPEAKER** acted. His action has been called a *coup d'état*, and, in so far as it is incapable of justification by any written order, statute, or precedent, it certainly was such. Probably, after the momentary sense of relief from the tyranny of the Home Rulers which was at first experienced, no member of the House felt altogether satisfied

It was in the circumstances, perhaps, making a bad job, because after the refusal of the Speaker to adopt a legitimate and certain mode of removing the plague, there was absolutely nothing else left to do. It is, however, quite clear that the Speaker cannot and ought not to be expected to interfere constantly in this way; and the fact of his having intervened once makes it all the more necessary to devise for the future a regular course of proceeding. Perhaps better than Mr. GLADSTONE's plan, even limited as it is in the direction of Sir STAFFORD NORTHCOTE's amendments, would be a co-ordination of the new rules already adopted for the purpose, with perhaps some added precaution. The forty-one hours' sitting of this week may be pardonably taken as exhibiting obstruction at its very worst. Yet, had it been impossible for Dr. CONNORS and Mr. SEXTON to make their two and three-hour harangues, and had the plan of suspending each member when it became obvious that he was merely repeating himself of set purpose been adopted, that obstruction could have been defeated in half the time without any *coup d'état* at all. As for Mr. GLADSTONE's proposal, it is so far satisfactory in that it puts the powers which it confers rather in the hands of the Speaker, who is presumably impartial, than in the hands of the leader of the majority. But there can be no doubt that, in order to render it a safe power to entrust even to such an official—and it must be remembered that partisan Speakers are not absolutely unknown in the past or impossible in the future—amendment, in Sir STAFFORD NORTHCOTE's sense, was necessary. Mr. GLADSTONE's form not merely armed the Speaker with dictatorial power in regard to a particular measure, but in regard to the whole business of the House, for an indefinite period; Sir STAFFORD NORTHCOTE's confines—though, in the shape in which it was accepted, not so definitely as might be desired—the period of urgency to the passage of a particular Bill. With the former it would be possible for a strong Government, in collusion with a servile Speaker, to spring upon the House a whole series of revolutionary measures which would have to be considered under duress. With Sir STAFFORD NORTHCOTE's the House would have already formed its judgment on the merits of the measure which, and which alone, it would then give powers to accelerate. The reduction of Sir STAFFORD NORTHCOTE's demands first for an absolute majority of the House, then for a majority numbering at least three hundred, to a three-fourths majority of a House containing the latter number was perhaps unfortunate; but it still provides against a snatched division far better than Mr. GLADSTONE's original proposal. Lastly, the suggestion that the House should be permitted to free itself from the state of urgency, instead of remaining absolutely in the Speaker's hands, is a clear improvement, as is the proviso that a Minister of the Crown shall give reasons for "urgency." It would be too much to say that the proposal, even as thus amended, is one which can be regarded with great satisfaction, but it is at least free from some of the dangers which would otherwise attend it, and which attend all plans of suddenly and finally burking, not an obnoxious or ill-believed individual or group of individuals, but the whole body of opponents or defenders of a particular measure or a particular right.

THE LAND LEAGUE AND THE CABINET.

THE audacious denial of the existence of outrage by the Land League members, and by such advocates of their cause as Mr. LABOUCHÈRE and Mr. C. RUSSELL, is sufficiently answered by the column of Irish news in every number of the daily papers. The same sheet in which Mr. RUSSELL's speech was reported contained a short account of an application to a Court in Dublin for substitution of service of an ejectment or other legal process on a tenant who refused to pay his rent. Affidavits were produced to the effect that a force of eighty policemen had been driven back by a mob when they attempted to protect an officer in serving the notice. It was added that no sheriff's officer would encounter the risk, and the plaintiff consequently applied for leave to serve the notice by post. Three or four other cases of outrage are reported on the same day; and it is stated that in many towns no tradesman can buy or sell unless he is provided with a certificate of membership of the Land League. In a case reported in Thursday's papers, the Queen's Bench Division, in Dublin refused an

application for bail on the part of the ringleaders of a riotous mob, which demanded the reinstatement on a farm of the descendants of a tenant who surrendered his holding thirty years ago, after receiving full compensation for his interest in the land. A branch of the Land League remonstrated with a priest who had bought some land in Cavan, on the ground that the tenants would prefer to purchase for themselves, of course at a price determined by the absence of competition. At a meeting, said to be attended by 7,000 persons, a priest complained that the Government grudged the possession of arms to the people, because it knew that they would use them against their enemies the landlords. The obstructive Irish members, though they neither disbelieve nor probably disapprove such outrages, have no hesitation in reiterating again and again the statement that Ireland is perfectly tranquil. The advantage to be gained by disputing notorious facts is not immediately obvious; but the first propounder of an untrue statement makes the task easier for those who follow; and the fiction, or unwarranted negation, like more unreal paradoxes, gradually passes into a commonplace. Mr. PARNELL and his associates might perhaps have rallied to their cause a larger number of adherents if they had not made themselves gratuitously odious to the House by their practice of obstruction. It may have been desirable to annoy their enemies, but they have by the same process alienated such friends as Mr. HORWOOD, who says that he intended at the beginning of the Session to vote against the Government Bill. His irritation against the obstructives has reconciled him to the unwelcome task of protecting life and property. The arrest of Mr. MICHAEL DAVITT is a satisfactory proof that the Government is not to be deterred from enforcing the law. In this case there is no question of conviction, as the Crown can at the discretion of the Ministers revoke a ticket-of-leave.

It is to be hoped that the two Ministerial speeches of last week may admit of a satisfactory interpretation; but some uneasiness was excusable when Mr. BRIGHT dwelt on the comprehensive character of the Land Bill, and when Mr. GLADSTONE carefully extenuated the stringency of the Bill for the Protection of Life and Property. He was equally solicitous to explain that the provisions of the Bill would not interfere with the organization of the Land League, or with its meetings if they were properly conducted. Probably all friends of order agree in the opinion that an exactly opposite result of a Bill for the protection of respectable Irishmen would have been more desirable. The professed object of the Land League is to induce tenants to reduce their payments for rent to a point fixed either by themselves or by the League. The whole purpose of the system is as dishonest and as lawless as the methods by which its objects have been attained. It is a caricature of constitutional cant to boast, in Mr. GLADSTONE's words, that the Ministerial Bill will allow of the most revolutionary and subversive proposals. It may be a question whether the measure should have been so framed as to prevent dangerous agitation, but it is not the business of a Minister to invite the exercise of license by ostentatious promises of impunity. One of the clauses of the Protection Bill seems to have been framed for the express purpose of at the same time rendering the other provisions inoperative, and providing superfluous facilities for Parliamentary obstruction. Every warrant issued under the Act by the Lord Lieutenant is at once to be laid before Parliament with the statement of the grounds of arrest. Either it is intended that the House of Commons should be a Court of Appeal from the Irish Executive, or the proposed enactment is a product of simple imbecility. It is perhaps but a secondary evil that the obstructive gang will have a plausible excuse for debating at length every arrest which may be made. Mr. FORSTER has hitherto, with imperfect success, answered questions on Irish judicial proceedings by declining to give information on matters under the consideration of the proper tribunals, but the new enactment will penetrate his judicious reserve. If documents are required to be laid before Parliament, it must be inferred that Parliament is to form a judgment on their contents, and the reasons or the evidence on which every arrest is founded will become proper subjects of debate. If a conspirator has been arrested for an offence committed in prosecution of a secret plot, all his confederates are to receive public notice of the substance of the information which may have been confidentially furnished to the authorities; and the malcontent Irish members are to have ample opportunity of airing the

also by selecting the culprits, and their accomplices. Mr. Chamberlain went out of his way to announce that the execution of the law would be subject to the review or supervision of Parliament. His meaning at the time was imperfectly understood, for it was impossible to suppose that the Bill would contain an absurd and suicidal clause. It may perhaps not be too late to correct a mischievous blunder; but the Land League and its organs in Parliament will not fail to take advantage of the admission of a false and vicious principle. It is difficult, though it may be necessary, to repose even a qualified and tentative confidence in a Cabinet which is capable of inviting the House of Commons to review the warrants of the Lord Lieutenant, and which announced in the Queen's Speech a measure for establishing authorized Land Leagues or little rebel Parliaments in every county in Ireland.

Mr. BAKER's confident and repeated assertions that the Land Bill will satisfy the Radical party were not a little alarming. The provisions of the measure, which are now approximately known, may perhaps justify his description. One of the many peculiarities of the present Government is that it cannot keep a secret, whether the revelation is made through indiscretion by the QUEEN'S Printer, or more deliberately in the columns of a semi-official newspaper. The *Standard* has for some time past occupied a singular position as the organ in one of its departments of the Conservative party, and in another series of articles of the Birmingham section of the Ministry. In its semi-official character the *Standard*, some time since, undertook to reassure the advocates of spoliation by a statement that, although the Bill would not directly establish fixity of tenure, it would effect the same object by circuitous methods. A few days since, in confirmation of its former statement, and in vindication of Mr. BRIGHT's accuracy, the *Standard* explained that due manipulation of fair or arbitrated rent and of freedom of sale would practically put an end to evictions. It is not known whether the rest of the Ministers approve of the communicative propensities of their Birmingham colleagues; but a contemporaneous statement made by the *Daily News* that the Land Bill would be explained before the final stage of the Protection Bill serves to imply that the announcement of the *Standard* was at the most premature. The object of the indirect form attributed to the forthcoming measure might, perhaps, be to evade a flagrant contradiction of Mr. GLADSTONE's declarations and arguments of 1870. He then exploded the fallacies which are used in support of fixity of tenure, and a congenial exercise of ingenuity in defending the system which he formerly condemned would depend on the condition that the transfer of ownership should assume some other name. It is proper to add that the *Daily News*, reasonably jealous of the confidence reposed in a political interloper, contradicts the statement of the *Standard*. The conflict between two journals of high character probably represents a division of opinion in the Cabinet, either as to the substance of the Land Bill, or as to the most convenient mode of presenting it to Parliament. Even if the Government overlooks the condition which Lord HARTINGTON suggested, that the measure should be just as well as comprehensive, it will be denounced by the agitators as insufficient; but the tenants will not permit their leaders to reject a large and perhaps extravagant boon. The managers of the Land League will console themselves for any moderation which they may be compelled to observe by the reflection that reduced rents settled by a Court may be as easily and as safely withheld as if they had been regulated by contract. The inability of landowners to resist partial confiscation will not increase the security of the residue which may be left them by law. The demagogues will find it more difficult to deal with the landless half of the rural population, which they will have deprived both of employment and of all hope of obtaining a share in the land. Vague promises of regard to the interest of the labourers will not be an adequate substitute for wages.

THE CHECK IN THE TRANSVAAL.

THE disaster at Laing's Neck is the more alarming because it implies that there must have been strong reasons for incurring a great and obvious risk. Sir GEORGE COLLEY cannot but have known the nature of the ground,

and the probability that he would be largely outnumbered by the enemy. It is said that, with a reserve of 1,000 men, he could have forced the pass; and a much larger force was, as he knew, on its way to Durban. It may, therefore, be assumed that he thought the urgency of the case sufficient to justify an immediate advance at all hazards. The object was probably the relief of one or more of the garrisons which are now besieged in the Transvaal. There would indeed have been a great advantage in crushing the rebellion at the outset; nor is it impossible that a victory at Laing's Neck might have induced the insurgents to negotiate; but the chance of shortening the war would scarcely justify a movement which, as the result has shown, was in a high degree dangerous. One writer who gives an account of the action oddly contends that the repulse was not a defeat; yet the advance is delayed for an indefinite time; the number of killed and wounded amounts to a fifth of the whole number engaged, and the loss of officers is so disproportionate that the 58th Regiment has been, rightly or wrongly, reported as commanded by a sub-lieutenant. Sir G. COLLEY, as might be expected, makes no attempt to disguise the real state of affairs. With an artillery to which the Boers have nothing to oppose, he with good reason feels confident of holding the camp to which he retreated after the combat. If he had thought fit to wait in his present position without fighting until his reinforcements arrived, he would have been in little danger of attack. The enemy will now make every effort to compel the surrender of some or all of the garrisons before Sir G. COLLEY is strong enough to resume his advance. Pretoria can be in no danger if it is true that the fort is provisioned for several months, and that the garrison had in a sortie taken a camp or fortified post several miles from the town. A force commanding the adjacent country is not likely to suffer from the interruption of the water supply; but it is not safe to rely on unauthenticated rumours.

The officious attempts which are made to promote agitation in Holland and Germany in favour of the insurrection furnish additional reasons for vigorous action. The time has not yet come for permitting the intervention of foreigners in quarrels which only concern the Empire and its dependencies. The interference of Dutch sympathizers, though it ought to be summarily repelled, is more excusable than the intrusion of German philanthropists or traders. One or two commercial associations have thought fit to protest against measures which, as they allege, would tend to exclude German manufactures from South Africa. Even if such considerations could properly be imported into a political question, it might be answered that in English Crown colonies the products of all nations are admitted to perfectly equal competition. The converse would not hold if the Transvaal became directly or indirectly a dependency of Germany. English annexations, however wicked they may be deemed by foreigners, invariably expand the area of commercial freedom. Even Portugal is threatened with a proposal that its Government should make an impertinent tender of mediation. The pretension, if it were advanced, would be founded on the possession by Portugal under a German award of Delagoa Bay. Mediation would perhaps tend to a commercial connexion of the Transvaal with Portugal which commands the most direct access to the sea. It may be hoped that the Government will have spirit enough to reject without entering on details all suggestions of foreign intervention. The convention with the Transvaal Boers in 1852 was concluded on the understanding that the Republic should have no foreign relations except with the paramount Power of South Africa. It may not then have been thought necessary to stipulate against transactions which could not have occurred to either party as practicable. It was only on the eve of the annexation that Mr. BURGERS attempted to enter into negotiations with Germany, which were peremptorily prohibited by Lord CARNAVON. The danger of similar intrigues may perhaps have been one reason for annexation.

The official documents and the statements and arguments of journalists which are published in the Transvaal are not calculated to encourage the sanguine hopes of a peaceable settlement which are entertained by a small party in England. The three persons who have formed themselves into a Provisional Government are not careful in their narration of past transactions to restrain themselves within the limits of truth or of probability. On former occasions they professed to have believed that, in

transmitting their remonstrance to the Government at home, Sir BARTLE FRERE encouraged them to hope that their petition would be granted. They now invent the absurd statement that he stated in a letter which accompanied the memorial that he had artillery at his disposal to blow the assembly of Boers away. Sir BARTLE FRERE had really said that, if he had known of the turbulence prevailing in the Transvaal, he might have applied to Lord CHELMSFORD for additional troops. One of the first duties of the ruler of a province is to discountenance any insurrection which may seem possible or probable by a due exhibition of force. As might be expected, Mr. PRETORIUS and his colleagues describe the act of Sir THEOPHILUS SHEPSTONE, which was undoubtedly hasty, as wanton and malicious. They refer neither to the desperate condition of the province at the time, nor to the language of Mr. BURGERS; and they are careful to forget that the annexation was not supported by any English force. They are equally silent as to the benefits which the country has since derived by the regulation of its finances, by the absolute security afforded against native enemies, and by the establishment for the first time of a just and regular Government. It is not, indeed, to be expected that they should furnish arguments against themselves, but it is necessary to check and correct inaccurate and incomplete statements. In the current number of the *Nineteenth Century* Sir BARTLE FRERE gives a full and instructive history of the circumstances of the annexation. He is not only a competent authority, but an impartial witness, as the transaction was completed before he assumed the government of South Africa.

The insurgent leaders deny the charge, which is nevertheless generally believed, that they have intrigued with the native opponents of the English Government. On the contrary, they allege that they were strictly neutral in the Zulu war, although they received overtures from CREWAYO. The war was, in fact, undertaken in the interest of the Transvaal more directly than for the benefit of any other province. The unfriendly feeling which the Zulu King had lately displayed to the English authorities was principally founded on his conviction that since the annexation of the Transvaal the English Government had identified itself with his enemies the Boers. It was true that Sir BARTLE FRERE had largely modified in favour of the Boers the territorial award which had recognized the right of the Zulus to disputed lands. The great army which had for two or three years been destined for the invasion of the Transvaal was destroyed or disbanded at a heavy cost of life and money, without the smallest co-operation from its intended victims. It is too much to boast, even if the assertion were true, that the people of the Transvaal were neutral in a quarrel which was essentially their own. The organs of the rebel Government are, as usual in such cases, more outspoken than their principals. They undoubtedly supply a conclusive reason for suppressing the revolt in their accusations and threats against their English neighbours. They assert that English shopkeepers have sold arms to the natives; and the charge is probably so far well founded that all the trade of the country is in English hands. It is not alleged that the traffic is unlawful, nor is it known to have attained large dimensions. The chief native market for arms was in the Diamond-fields, which are far from the Transvaal. Other menaces and expressions of ill-will are not even provided with an excuse. "Woe to the English" is denounced if they fail to join the insurrection to which they are unanimously opposed. It is the duty of the English Government to profit by the warning and to render the threat innocuous.

It is to be regretted that the Ministerial answers to vexatious questions about belligerent rights were not more simple and direct. It would have been easy to decline all discussion on the subject, and at the same time to explain the rules by which the conduct of the commanding officer will be guided. On a subsequent day Mr. CHILDERS furnished all the information which can reasonably be required in the form of a statement that the Boers will be admitted to the ordinary courtesies practised in warfare, including exchange of prisoners. It is satisfactory to learn that Sir G. COLLEY has thus far no reason to impute to the enemy any violation of the ordinary rules of warfare. The members who were anxious to know whether the Boers are rebels or belligerents probably entertained no doubt that they would practically be

regarded as parties to a regular civil war. The only purpose of the questions was to entangle the Government in some embarrassing admission which might either hamper its action or render the war unpopular. It is only in England that modern democracy seems to obliterate all sense of patriotism. Americans and Frenchmen holding extreme opinions court popular favour by affecting especial zeal for the honour of the nation. The corresponding political sect in England always sympathizes with rebels and with foreign adversaries. Forgiveness of personal enemies may be laudable, but extreme tolerance for the enemies of the State is more likely to proceed from feelings of disaffection than from charitable enthusiasm. In the present case the malcontents have thus far obtained little success. It is true that Mr. GLADSTONE and Mr. GRANT DUFF appeared to be puzzled on the point of belligerent rights; but the rapid despatch of reinforcements to South Africa is the best practical reply to foreign and domestic remonstrances. The Boers are belligerents in the sense that they are engaged in a war of their own seeking, which the English Government is prosecuting with satisfactory vigour.

GERMANY AND ENGLAND.

A CORRESPONDENT, who styles himself not inappropriately an "Unfortunate English Resident," has written to the *Pall Mall Gazette* to describe the sufferings which he, as an Englishman, is undergoing under the persecutions of the German press. He finds that England and everything English are at a sad discount in Germany. Every day papers of all shades of opinion unite in vilifying the English Government, both English parties, English policy, English manners, and all Englishmen and all Englishwomen. The special charges on which the chief reliance is placed to sustain this indictment against a nation are that the English are stirrers-up of strife and are great tyrants. To prove the first charge it is pointed out that England has not turned round on Greece with the suddenness which has marked the termination of the fleeting friendship of France. To show how tyrannical England is, nothing more is needed than to watch her shooting down the Boers merely because they wish to be free. When Germans take a fit of national passion they are apt to go thoroughly to work. They are excited, and give free vent to their excitement. They are good haters, and like to let their hatred be known. They used to write just in this way against the French, then against the Russians, and then came the turn of the Jews; now England is the mark of German scorn, and this fashion will last its little day. The English Resident cannot be wholly mistaken as to a plain matter of fact, and there is, no doubt, much ignorant and vulgar abuse poured on England by German journalists. But the English Resident is unfortunate, not only because he lives in Germany at a time when England is being abused, but also because he does not seem to be quite the man to live in Germany at all. Life in a foreign country is intolerable unless the resident foreigner is prepared to make the best of those with whom he is thrown, to see their virtues as well as their vices, and to pass over bursts of momentary nonsense with a kindly smile. The writer of this lamentation appears to be disposed to see everything German in the darkest colours possible. If the Germans hate the English, he wishes those whom he meets daily in the intercourse of business or pleasure to observe that there is at least one Englishman who hates the Germans. The primary cause of the present animosity is, in his eyes, the foolish and excessive praise which Englishmen have in recent years been heaping on Germany. They have taken us at our word, have been puffed up by our homage, and have been seduced by us into an honest belief that they are the first, the noblest, and the greatest people in the world. They are, indeed, so puffed up that they cannot brook a rival near the throne. England comes a little too near them for things to be quite satisfactory. Accordingly they cannot look on England without envy. This is the root of the whole matter, the German envy of England. And in the case of England they can express what they feel, for England cannot very directly hurt them, whereas they have been obliged to give up writing against France, for the remodelled French army is now so strong that they dare not provoke it to try its

strength. A man who thinks the Germans a poor set of overpraised people, who can see no motive to account for adverse criticism on our military experiences except a stupid envy, and who believes that the French army keeps German journalists from abusing France, may be very excellent in other ways, but he certainly does not seem well qualified to pass his life in Germany.

England is always being abused now here and now there; but Englishmen, as a rule, bear this abuse with calmness, because, in the first place, they are accustomed to free criticism, and, in the second place, because they have learned not perfectly, but still in a great and increasing degree, to take foreign criticism in conjunction with the special circumstances of the country in which criticism adverse to England is passed. We are always criticizing everybody; other countries take up criticism by fits and starts. Every day we find column after column in our papers in which Correspondents describe everything that is going on abroad only to show how much better and wiser they are than those whose doings they describe. Nothing is too high or too low for us. We can detect an error in Portuguese policy almost before it is made; and we are let into the minute secrets of M. GAMBETTA'S mind. We watch the policy of Prince BISMARCK towards the Church or the Socialists with as much ready interest as if the ecclesiastical contests of Germany were going on in the diocese of London, or as if the Socialists with whom he has to do lived at Northampton. We are flooded with all this information, and feel all this attraction to what is going on abroad, partly because England is really much more intimately connected with foreign countries than any other country is, and partly because our journalism is much further advanced. It is older, richer, more independent of hack writers, much more widely read than the journalism of any Continental nation. Through long practice, and favoured by circumstances, our journalism has become tolerably fair. Our criticism on foreign countries is often mistaken, but it is in the main honest, and in proportion as criticism becomes honest it becomes guarded. It is not the malignity or the pettiness of our foreign Correspondents, but their air of almighty wisdom, which makes us feel every now and then, when we read what they write, that we are not in very safe hands. And we have got into the habit of discounting criticism and taking something off attacks on foreign Governments and statesmen, because experience has shown us that criticism, however honest, is sure to be inclined to take the outside and obvious view of things, and to save itself the trouble of going deeper than the surface. Every Englishman accustomed to the habits of critics knows perfectly well that it would be the most difficult thing in the world to bring ourselves to do complete justice to any other country which was in the circumstances in which we now are. It is the nature of criticism, unless it be deliberately friendly, to attribute the worse motive rather than the better; and there is always room for the attribution of the worse motive in dealings such as ours for the most part are, the dealings, that is, of a strong and civilized country with weak and half-civilized antagonists.

Then, again, when we consider the value and meaning of German criticism, we must take it in connexion with the special circumstances of Germany. German literary criticism is old, and has its special merits, which are universally recognized. It is always profound, and in the days of GOETHE and HEINE was brilliant. But German political criticism is very young. There are, of course, exceptions; but, as a rule, it may be said that German journalism is poor stuff, and is mainly the work of hack writers. The Germans are perfectly aware of this, and are as much ashamed of their "reptile press" as any people could be. They are never sure why people write what they write. It is always open to conjecture that any one may be secretly inspired by the Government. Even the abuse of England is supposed to be secretly inspired by Prince BISMARCK; and the apprehension that possibly Prince BISMARCK wishes things to be said makes it seem a patriotic duty to welcome them when they are said, and gives an opening to the humblest reader to think that, if he applauds what he finds in his journal, he is taking his part in the furtherance of German foreign policy. Probably the truth is that there is some reality in these bursts of national feeling now against France, now against Russia, now against England, and

that Prince BISMARCK gently stimulates them, partly as a safety-valve for political sentiment, and partly because they happen to fall in with his wishes for the moment. Far from fear checking them, it is fear that gives birth to them. The Germans know what war means, even to the conquerors, and they always fear the nation from which they think that a beginning of war may come. As France is now eminently and Russia seems determined to stay her hand, they cannot find any source of danger but England. Any sort of suspense is painful to them; and they think that, if England would but join heartily in quenching the hopes of Greece, there would be at least a temporary lull, and they might feel happy for a moment. Their abuse of England is merely, if not wholly, an expression of their own ardent longing for rest. Great allowance must be made for a people which is always on guard in a camp. Perhaps most Germans would theoretically adopt the teaching of Count MOLTKE, that war is a great purifier of society, but they would prefer that just now the moral benefits of war should be enjoyed by other people. It is needless to say that fear of this sort is quite consistent with the highest personal courage. The bravery of the nation that fought the triumphant war of 1870 is alike beyond question and beyond praise. But united Germany is something so new and so far beyond expectation that those who have won it can scarcely believe that they will keep what they have won. A generation must pass away before Germany can be quite sure of its own existence; and those who are happily more secure may bear with equanimity the petulance, and even unfairness, of a people which scarcely knows whether the dawn has really broken for it, and whether the sun of its empire may not yet be obscured.

THE HOPES OF THE GREEKS.

THE balance of probability for the moment, perhaps, inclines in favour of peace between Greece and Turkey. In answer to Mr. TRICOURIS, who, in his present state of greater freedom and less responsibility, is naturally penetrated with patriotic impatience, Mr. COMMODOUROS gave vague assurances of the military activity of the Government without pledging himself to any definite course of action. It is not necessary that the Greek Government should take part in the negotiations which now seem likely to begin at Constantinople. M. ST-HILAIRE'S project of arbitration came to nothing because neither of the principals in the dispute could be persuaded to invite the intervention of the proposed tribunal. The Turks insisted on knowing beforehand the substance of the intended award, and the Greeks were not inclined to surrender their supposed rights under the decision of the Conference of Berlin, unless they were assured of some substantial equivalent. They were especially and not unreasonably anxious to ascertain whether the Powers which took part in the arbitration would undertake to enforce the award. As they could obtain no answer, they confined themselves to military preparations, either for the purpose of actual war, or as the most effective mode of applying pressure to the European Governments. The present negotiation may not improbably share the fate of many previous diplomatic experiments; but in a question of peace or war there is generally an advantage in gaining time, and perhaps the Turkish Government may during the discussion indicate the probable limits of its future concession. The Greeks have, it appears, partially failed to raise the loan on which they relied for the purposes of the campaign; their transport and commissariat are not yet in an effective condition, and the last reserves are not called out. During some of the late discussions members of the Government of Athens have affected to believe that war might tend to their advantage, even if it began with a defeat; but no statesman in his senses would order an army to cross the frontier in the belief that it would be beaten at the outset of the war. There can be no doubt that as far as the menaces of Greece are serious they imply a conviction that the brunt of a conflict with Turkey will be borne either by European protectors or by allies in the neighbouring provinces. The intimation made in the course of last summer by the English Minister that his Government would no longer discontinue the mobilization of the Greek army was probably interpreted as a promise of aid. At that time the English Cabinet were prepared

to extend the objects of the naval demonstration to the settlement of the Greek frontier. Down to the present time England, though concurring in the decisions of other Powers, has always been somewhat more backward than France or Germany in considering proposals tending to a compromise.

Within the last week the Greek Government has probably hoped that a change in its favour was about to occur in France. The debate in the French Chamber and the unanimous approval of the Ministerial policy will perhaps dispel a lingering illusion. M. ST. HILAIRE has been more explicit than the Minister of any other Power and than his own predecessors in explaining to the Greeks the positive determination of his Government to withhold material aid in the event of a war with Turkey. His arbitration project was, from the first, obviously destined to failure; and some of the arguments by which he enforced moderate counsels on the Greek Government were calculated to produce an opposite result. It was scarcely judicious to warn those who were eager to fish in troubled waters that the disturbance on which they calculated would be general and profound. M. ST. HILAIRE's exposition of the scope of the various Berlin decisions might be just, but to a Greek Minister it could scarcely be persuasive. Mr. COUMOUNDOURIS was probably gratified by the publication in one or two semi-official French papers of criticisms on M. ST. HILAIRE's diplomacy which might well be construed as warnings. The journals which are believed to express M. GAMBETTA's opinions, after long silence began to censure and ridicule the Greek policy of the FOREIGN MINISTER. The fall of M. WADDINGTON and the dismissal of M. DE FREYCINET were preceded by similar intimations; and M. GAMBETTA's power over French Chambers and Cabinets has thus far given no sign of decay. The inspired articles may perhaps have been addressed rather to the Porte than to M. ST. HILAIRE, for they have since been disavowed or explained away, and the late vote is decisive. It would be scarcely dignified on the part of the French Government to add another change of policy or misunderstanding to several previous vacillations. The Yellow-book, which has just been published, records with amusing fidelity the gradual withdrawal of the French Government from the position of patronage of Greece which had been assumed by M. WADDINGTON at the Congress of Berlin. Before his retirement from office M. WADDINGTON himself suggested a compromise by which the possession of Janina would remain with Turkey. Soon afterwards the present English Cabinet devised the plan of a Conference at Berlin to which M. DE FREYCINET readily assented. Notwithstanding M. ST. HILAIRE's recent arguments, the parties to the Conference never doubted that its sentence would be authoritative and final. To this extent the Greeks are fully justified in their present contention; but the truth is that Europe, for once unanimous, committed a flagrant blunder, which it is now determined to correct. A partial exception may perhaps be taken in favour of England. Mr. GLADSTONE and Lord GRANVILLE probably intended to compel the submission of Turkey; but their error consisted in their neglect to ascertain, before they arranged a nominal European concert, that none of the other Powers were disposed to resort to force. The other Governments seem to have assumed that England and France had assured themselves of the submission of Turkey. Whatever was the cause of the general misapprehension, there is no doubt that it occurred.

Immediately after the close of the Conference the naval demonstration was organized at the instance and under the direction of England. The credit of success at Dulcigno must be placed to the account of the Government which would have been responsible for the failure of a doubtful enterprise. When the Montenegrin question was at last settled, Lord GRANVILLE politely communicated to M. DE FREYCINET the wish of the English Government that France should take the leading part in the next operation of obtaining the transfer of Thessaly and Epirus to Greece. The French Minister, with equal courtesy, positively declined to interfere with the precedence which had with honourable ambition been already assumed by England. Lord GRANVILLE's project of European concert had been professedly intended to secure the execution of the provisions of the Treaty of Berlin with respect to Montenegro, Greece, and Armenia. There could, he said, be no doubt that the second and

third undertakings devolved on the Power which had already accomplished the first. He might have added that England had, before the session of Delcœur, proposed the occupation of Smyrna for the purpose of securing all the required concessions from the Porte. It may be remarked that, in his formal and elaborate disclaimer of the right and duty of settling the boundary question, M. DE FREYCINET remarked that Greece had acquired an irrefragable title to the position defined by the Conference at Berlin. The discovery that the functions of the Conference were merely consultative, was reserved for a later stage in the controversy and for another French Minister of Foreign Affairs. French statesmen were eager to escape from the responsibility which M. WADDINGTON, probably for the purpose of asserting the importance of the Power which he represented, had undertaken at Berlin. The object was accomplished by Mr. Gladstone's scheme of European concert which was the first act of the new Cabinet. Domestic difficulties fully account for the recent acquiescence of the English Government in the pacific policy of France and Germany. It is highly improbable that M. GAMBETTA should urge any French Government to resume the direction which may have passed from the hands of England. According to a late rumour Germany and Austria disapprove of a demand made by the English Government that the Porte should at once announce the extreme concession which it is prepared to make. In diplomacy it is seldom expedient to insist at the beginning of a negotiation on the delivery of an ultimatum. It is certain that the Turkish Government will make a hard fight for Larissa, and that it will in no case surrender Janina. It may be doubted whether it would be for the interests of the Greeks to occupy a town which has long been considered the capital of Southern Albania.

RAILWAYS AND COMMONS.

IT is necessary again to call attention to the plans which certain Railway Companies have in view for spoiling such of the Surrey commons as the progress of metropolitan improvement has left uninjured. The Guildford, Kingston, and London Railway Bill and the Wimbledon Common Railway Bill are both before Parliament; and, in the present inability to gain a hearing for any question that is not connected with Irish crime or Irish obstruction, it is quite possible that they may slip through some important stage without being noticed. A letter in the *Daily News* of Tuesday describes very well what Wimbledon Common is, and how these interesting schemes propose to deal with it. A good deal of trouble has been taken to secure these thousand acres, with the singularly varied landscape enclosed by them, for the public use. In 1871 a composition was made with Lord SPENCER in consideration of his making over his interest as lord of the manor to a body of Conservators. One of the functions of these Conservators is to resist any encroachment upon the Common, and they are forbidden to give their consent to the alienation of any part of it. But what Parliament has done Parliament of course may undo, and though it would be useless for the enemies of the Common to assail the Conservators, there is nothing to hinder them from asking Parliament to override the powers it has given to the Conservators. This is what the promoters of these two railways are now about to do. The Guildford, London, and Kingston line is to be carried, according to the writer in the *Daily News*, across "about a mile of the Common, in an open cutting, destroying some of the prettiest copse wood, and severing a large area, which will henceforth be almost useless." The Wimbledon Common Railway proposes to take nearly as much of the Common, together with a portion of Richmond Park. The Guildford and Kingston Railway has the further demerit of spoiling several of the more distant commons on the London side of the North Downs. In this respect a third line, promoted by the London and South-Western Railway Company, is equally a sinner. For the moment, however, we shall confine ourselves to the proposed encroachment upon Wimbledon Common.

The Guildford and Kingston line is probably one of that class of railways which hoped to create the demand by creating a supply. As regards the two towns which it is principally to serve, neither can be said to be badly provided with the means of communication either with

one another or with London. There is an ample service of trains between Waterloo and Guildford, and an almost continuous service between Waterloo and one or other of the stations at Kingston. Whether, however, there is any reasonable prospect of an adequate traffic growing up between the villages which would be served by the new line between Kingston and Guildford is a question we shall not attempt to answer. It is no business of ours if people like to throw away their money on schemes for giving a railway of its own to every secluded village in Surrey. All that we contend is that this accommodation should be provided at the cost of the shareholders and not at the cost of the public. If the promoters think that it will pay them to carry passengers and goods between Guildford and Kingston by a route which has no visible advantage over the route which already exists, they are welcome to try the experiment. Apparently, however, they do not think that it can be made to pay, except they can induce the public, as represented in Parliament, to grant them a subsidy out of its own pocket. For this, and nothing less, is what is meant by the proposal to take the railway across Wimbledon Common. The promoters of the Bill may be entirely acquitted of any desire to spoil the Common for the mere pleasure of doing mischief. They wish to spoil it that they may have less money to lay out in compensations. The writer in the *Daily News* says that they have "deliberately deflected from their straight course" in order to cross the Common, rather than cross the private land bordering on the Common. The reason is that if a railway Company takes land from a private owner, it is obliged to pay him the value. Where the land belongs to the public, it is seemingly considered to have no value—at least the public gets nothing when it is appropriated. Thus, a fact which ought to serve as a special protection to a common really works the other way. Common-land ought to be held specially sacred against railway encroachment, because there is no means of compensating those who lose by its destruction. Supposing that Parliament were to say that the same compensation must be paid for taking Wimbledon Common as for taking the same amount of private property, the insuperable difficulty would present itself that there is no one to pay it to. The Conservators are only trustees; the Wimbledon ratepayers are scarcely more; the real *cestui que trusts* are the multitude of Londoners who walk or lounge there in the course of the summer. They cannot be compensated for the loss of the Common; they can only be either confirmed in the enjoyment of it or simply and nakedly robbed of it. It is to this last alternative that the consent of Parliament is about to be asked, and such a request is tantamount to a proposal that the public shall be compelled to subsidize the new line. Whatever the difference may be between the cost of carrying the railway over Wimbledon Common and the cost of carrying it over land abutting on Wimbledon Common is so much taken from the public and put into the pockets of the promoters. A common of a thousand acres is not so large that it is essential to take a line across it rather than alongside of it. Even if a deflection from the straight course had to be made in order to avoid the Common, no inconvenience would be caused to travellers comparable with the loss inflicted on the public by the destruction of the Common. In this instance the deflection is to be made not to avoid the Common, but to include it; the loss is to be inflicted on the public, not for the convenience of travellers, but for the profit of the shareholders. Shareholders are excellent people in their way, but we are not yet inclined to vote them a grant in aid.

The important thing at this moment is to ensure that the demerits of these two Bills shall be thoroughly threshed out in Parliament. If they are passed, it will probably be because those who will be injured by them are not conscious in time of what is going on. There are enough members of the House of Commons to take up the argument if the subject can be forced upon their attention, but with so much else before them it is scarcely to be expected that they should have much attention to spare for it, unless it comes to them recommended by a strong popular support. To large parts of London Wimbledon Common is at least as accessible as Hampstead Heath; there are already three stations from which it may be easily reached; and, in consequence of this, the number of persons who will be injured by the proposed

railways is very large. We do not profess to know how the opinion of these people can best be brought to bear upon Parliament; but the natural course would seem to be that the Commons Protection Society should at once organise public meetings and petitions in various parts of London. Possibly Mr. FAWCETT and Mr. SHAW LARSEN may feel themselves unable to lead the opposition to these Bills now that they are in office; but, if there is no Ministerial tradition to this effect, they are the natural persons to be applied to. As soon as the resistance to the designs of the Companies becomes serious, we shall probably be told that the object of making the new line is really to bring the Common within reach of many who now find it too far from a station. It is this, it will be said, and not any base thought about money, that has suggested the idea of carrying an open cutting across the Common. The worth of this assertion may be tested by a very simple experiment. If the new line is to be constructed in the public interest the shareholders will not mind making their benevolent intentions still more effective by substituting a tunnel for an open cutting. It will be more costly; but people who go out of their way to become public benefactors will not grudge the additional outlay that is needed to make their gift complete. If the railway remains invisible, there can be no objection to its bringing passengers nearer to the Common. All that need be required is that the trains shall not be aboveground for a single second of the time that they are traversing land belonging to the public.

M. GAMBETTA'S SELF-DENIAL.

IF to be the object of continual speculation is one of M. GAMBETTA'S desires, he has been richly rewarded for his self-denial in contenting himself with the post of President of the Chamber of Deputies. If he had preferred to become Prime Minister, he would only have been talked about in virtue of his own acts. Being what he is, he is equally talked about in virtue of every one else's. Not a deputy or a senator rises to be a Minister, not a Minister sinks once more into being a deputy or a senator, without M. GAMBETTA'S part in the transaction being as closely scrutinized as though he himself had undergone the change. Nobody dreams of assigning any other reason for a Cabinet crisis than some change in M. GAMBETTA'S purposes. Whether it is M. DE FREYCINET who falls, or M. FERRY who succeeds, or M. ST-HILAIRE who is weighed in the balance, it is all traced to the same quarter. In the eyes of the public, to be the maker of Ministers is more than to be a Minister. Power exerted behind a veil is more attractive than power exerted in the open day.

Two eminent Paris journalists, M. WEISS and M. SCHERER, have lately been amusing themselves with criticizing M. GAMBETTA'S position. M. WEISS has defended it on the ground that it is not formally irregular. There is nothing in the Constitution that prevents the President of the Chamber of Deputies from being wire-puller-in-chief at the same time. M. SCHERER does not dispute this contention. M. GAMBETTA'S position may be as regular as M. WEISS maintains it to be; all that M. SCHERER cares to maintain is that it is a highly inconvenient regularity. He supposes by way of illustration that the representatives of the Great Powers are in communication with the MINISTER of FOREIGN AFFAIRS. The Minister makes such and such declarations as to the policy of France, and the Ambassadors find that these declarations are entirely in accord with the views of their own Governments. They feel, however, that this discovery does not carry them very far, and so, though they would like, for the sake of politeness, to declare themselves perfectly satisfied, they are obliged as men of business to ask whether M. GAMBETTA'S views are identical with those of the Minister. In this way they make it clear that it is of much more moment to them to know what M. GAMBETTA thinks than to know what the men who nominally govern the Republic think. A Government which has to put up with this sort of treatment, and cannot resent being postponed to M. GAMBETTA by the representatives of the Great Powers because it knows that such a postponement is strictly borne out by the facts, is necessarily in a state of paralysis. This is the price the country pays for the privilege of being governed by an occult influence, and in M. SCHERER'S opinion it is a very high price. It is singular that even

the boldest commentators on the mysteries of M. GAMBETTA'S conduct decline to hazard any explanation of it. M. SCHERER contents himself with stating the questions which any one giving such an explanation must be prepared to answer. Why has M. GRÉVY never called upon M. GAMBETTA to form a Cabinet? How has he been able to find Ministers who will accept office under all the disadvantages which M. GAMBETTA'S attitude imposes on them? Why has the Chamber of Deputies continued to elect M. GAMBETTA as its President, and to put up with a succession of Cabinets which have no other recommendation than that of occupying a place which belongs of right to M. GAMBETTA, but which he does not choose to fill?

The answer to all these questions is easily found; but, when found, it suggests a further question, to which M. SCHERER does give something like a reply. The reason why neither M. GRÉVY, nor his Ministers, nor the Chamber of Deputies, has put an end to the present anomalous state of things is simply that M. GAMBETTA prefers that the present anomalous state of things shall continue. The country wishes to be ruled by M. GAMBETTA, and, in order to gain its desire, it consents to be ruled by him on his own terms. It is part of this understanding that he shall not be asked to take office until such time as it suits him to take it, and the question upon which the situation really hangs is at what time it will suit him to take it. To this inquiry M. SCHERER has nothing new to say. M. GAMBETTA will take office, he thinks, after the general election in the present year. The present Chamber was not elected on a sufficiently personal basis. It was returned in order to put an end to Marshal MACMAHON'S attempt to overthrow the Republic. Any candidate that presented himself was good enough for this purpose, provided that he avowed himself in sympathy with it. With the men of the 16th of May in power there was no inducement for a man to call himself a Republican unless he really was one. Before M. GAMBETTA takes the Government into his own hands he desires to have a Chamber which has been returned for the specific purpose of supporting his administration. M. SCHERER'S practical conclusion consequently is that, though it is very inconvenient to have things going on as they are, it is an inconvenience that will not have to be borne much longer.

It may seem presumptuous to differ from M. SCHERER upon a point like that under discussion. We cannot but think, however, that to attribute M. GAMBETTA'S distaste for office entirely to his distrust of the present Chamber is to press an explanation a little hard. Whenever the deputies have found themselves on a different side from M. GAMBETTA they have been quick to retrace their steps. If it turns out that a vote which they thought would please him has had a contrary effect, they make haste to rescind it. If he gets tired of a Minister, they leave him in a minority; if he changes his mind and wishes a Minister kept in, the minority speedily becomes a majority. If they are ready to do all this when M. GAMBETTA is not in office, it may be presumed that they would not have been less ready to do it had he been in office. We should be inclined, therefore, to look for the motive of M. GAMBETTA'S refusal to have the form of power even when he is most plainly enjoying its substance in another direction than that suggested by M. SCHERER. Why should not the explanation be found rather in the character of the work which the present Chamber has had to do than in the character of the Chamber itself? There is no need to go into the question why M. GAMBETTA should have thought it necessary to encourage the deputies and the Government to undertake the ecclesiastical legislation of which so much has lately been heard. It may be that he thought it indispensable that certain former pledges of his should be redeemed either by others before he took office, or by himself after he took office, and that he preferred the former alternative. It may be that he did not wish to quarrel too soon with the Extreme Left, and that the attack upon the Church offered him a means of postponing the inevitable severance. It may be that he himself overrated the strength of the Extreme Left in the country, and that it was not until the recent municipal elections that he felt completely at ease upon this point. Any one of these hypotheses will make it intelligible that M. GAMBETTA should wish certain things done without assuming the full responsibility of getting them done. By refusing to take office until after the next elections he has probably accomplished this. The

ecclesiastical legislation of the last two years and the ecclesiastical administration which has been invoked to fill the gaps in ecclesiastical legislation are not specially associated with M. GAMBETTA. M. FERRY was the author of the Seventh Clause; M. FERRY'S was the will that carried into execution the decrees dispersing the religious orders; it is M. FERRY who has given France the Bills which secularize elementary education; it is to M. FERRY that she will owe the law making military service compulsory on young men in training for the priesthood. If M. GAMBETTA hereafter finds it convenient to disown the author of these various measures, he will not have much difficulty in so doing. He will only have to fall back on Mr. GLADSTONE'S distinction between the various senses of repudiate, and disapprove of M. FERRY'S legislation while continuing to carry it out in practice. In this way, if it should suit him to play the part of a moderator in the dispute between the Church and the Republic, he will approach the task under much more favourable conditions than if his name had been publicly associated with the measures of the last year or two. Whether such a part will suit him only the future can show, but there are not wanting indications that it may do so some day.

SPAIN AS A GREAT POWER.

IT sometimes happens in England that a town becomes suddenly alive to its own importance, and, casting about for a way to make its nascent eminence known to the world, proclaims that it ought to be represented in Parliament. It counts up heads and shows that it has quite as many, or nearly as many, inhabitants as some other town that enjoys the benefit of Parliamentary representation. It dilates on its respectability and resources. So stable are its municipal institutions that its Mayor has been twice re-elected, and so high is its credit that it has at least been able at some period to borrow more largely than any one could have expected. It might not be any special benefit to Parliament to have a new member, or any very clear gain to the town itself to send one; but it would like to have its pretensions publicly recognized. One Ministry might reject its claims, but another might be more favourable; and there is always a hope that some Ministry or other may be got to see that its own interests are at stake, and that it would be very foolish not to back up a town that would be sure to send the right sort of man to vote in the right way. Spain appears to be haunted at present with a similar ambition. She thinks that it would be very delightful if she could but be recognized as a Great Power. She would like to sit in the councils of Europe, and considers she has very nearly as good a title to the distinction as Italy. She counts up her population, and shows that her millions are not so very much fewer than the millions of Italy. She has also now been for five or six years under the same form of government, and feels naturally proud of something so rare and so creditable. If she does not quite pay her debts, she does not quite leave them unpaid. Why, then, she asks, should not she be represented when Europe meets in council? One answer would appear to be that, except in population, she is as unlike a Great Power as a State can be. She is poor and backward; she has taken no part in the formation of recent European history; she has no external interests to defend; she contributes little to the material, and still less to the intellectual, stock of European wealth. Italy has fought Russia in the Crimea, and Austria in two campaigns. Her fighting may not have been very successful, but still she has fought. Italian commerce out of Italy is pushing and widely spread. Spanish commerce out of Spain or Spanish colonies is simply non-existent. Italy has in recent days produced great men, not only the late KING and CAVOTI, but crowds of men with the knowledge and instincts of statesmen. Spain has recently produced, to put it briefly, the persons whom it has produced. Italians pay up honestly; they explore, colonize, write. They are engaged in really great experiments in education. They are Europeans in the midst of Europe. The Spaniards are almost out of Europe geographically, and are still less in it in politics, arms, literature, and commerce. All that can be said for them is that they can show a total of seventeen millions of population, and have now been five or six years without a dynastic revolution.

It is said, however, that it is not so much Spain that wants to be recognized as a Great Power as Germany is.

combination with Austria that is pushing on Spain to ask for this recognition. Spain is looked on exactly as a town is looked on that it is thought might have Parliamentary representation given it. Germany would like to have a safe vote, on which it could count. In these days of arbitration and forced decisions dependent on the vote of a majority, the European council is becoming exactly like a representative assembly, and Prince Bismarck, with the votes of Austria and Spain safe in his pocket, could be as successful a boroughmonger as the famous Duke of Newcastle. England or France would be quite powerless unless they acted together; and, if they did act together, they would have to get both Russia and Italy to vote with them in order to obtain a majority, while Germany would only have to get one or the other over to its side. It is no doubt true that actual voting is very rare in the annals of diplomacy, and is perhaps merely an offshoot of the modern scheme of the European concert; but there is always some work of a European kind going on, and the admission of Spain to take part in this work would make anything like the effectual carrying on of this work almost impossible. It is bad enough that six Powers should all have to consult each other before anything can be done, and it would be much worse if seven had to consult each other. But it would not be merely that there would be a seventh Power. This seventh Power would be Spain. To necessary delays would be added unnecessary. The diplomacy of Spain is as dilatory as that of the Porte. It would be always to-morrow that Spain would be inclined to begin. Lord GRANVILLE said that he could not carry the European troop faster than the pace of the slowest rider in the band. If Spain was added to the corps, the pace of the slowest rider would be the pace of the animal that could only go uphill by standing still. If anything could comfort an English Foreign Secretary under this infliction, it would be the reflection that now foreigners would have an opportunity of understanding what obstruction means. Not that Spanish obstruction would be of the vulgar or insolent sort. It would be merely obstruction of that decorous, dull, hopeless sort which sets in when an Irish member begins to read a Blue-book. No European concert could stand perpetually such a strain, and some day the presiding Power in the council would have to declare that Spain must sit down, and that the main question must be put at once.

Those, however, in whose hands the destinies of Europe are placed, think, not only of inevitable despatches and discussions, but also of possible action. Prince BISMARCK, above all men, never forgets the possibility of action; and he is said to have not thought it worth while to conceal that he hopes to find in Spain a check on Republican France. To make even a faint claim to be recognized as a Great Power is to proclaim a willingness to fight in the last resort. Spain would be expected to pay its footing in the European council by taking part in the next war. As she has no navy worth speaking of, she can only go to war with France, or with England as the ally of Portugal and the holder of Gibraltar. With the utmost frankness, Spaniards confess that they really have, and can have, no proper foreign policy except so far as they would like to take Portugal and retake Gibraltar. If they search very hard for something else to seem interested in, they make the most of their tiny possessions on the coast of Morocco. But as to Portugal and Gibraltar, they own that, although success, if it could be achieved, would be most brilliant and desirable, yet a war with England would be simple madness. For Spain has colonies which she values very highly, and which she could not retain for a month in presence of the English navy. She has therefore no choice, and, if she makes war, must make war with France. It was the perception of this that animated the late Emperor of the FRENCH to object strenuously to the proposal to place a Hohenzollern on the throne of Spain; and so far, from the point of view of French interests, he was quite right, although he subsequently placed himself entirely in the wrong. It is impossible that any Spaniard should think with a light heart of a real war with France. But, on the other hand, a war with Germany, into which Spain might be easily drawn, even against its will, by its powerful protector at Berlin, is a prospect that to French eyes is not without its very serious side. Italy, which has everything to lose and nothing to gain by a war, has at least this advantage, that she can sell an alliance worth having to either of the probable combatants.

Spain has no choice. If she attacks any one, she must attack France, and the alliance of Berlin is indispensable to her. Nor could she hope to keep out of war altogether. She may indeed confidently rely on being able to do this so long as she retains her present modest position; but, if she offers herself as a Great Power, she also inevitably offers herself as a Power that is ready to fight. All this is too obvious for Spaniards not to see it, and the rapture excited by the new dream of greatness is by no means universal. There are still men in Spain whom prudence has not altogether deserted, and who think that the glory of keeping an English or French Foreign Minister waiting months for an answer to a despatch would be dearly purchased by the risk of a great war being forced on a country with a poor and backward population, an untried army, and most disordered finances. It is to the interest of all Europe that to the other difficulties of the European concert there should not be added that of having to face the interminable delays of Spanish diplomacy. It is still more to the interest of France that Germany should not plant a new thorn in her side. But it is most of all to the interest of Spain herself that she should rest contented with the position suited to her, and should desire nothing more than the ease and security of a modest and unpretending life.

THE RIVERS CONSERVANCY BILL IN THE LORDS.

THE Rivers Conservancy Bill did not meet with an entirely favourable reception from the Lords. Before it was read a second time, the usual ominous suggestion of referring it to a Select Committee had been made by one or two peers. Where questions of rating are involved, a Select Committee is the familiar friend of legislation, and it usually behaves as the familiar friend does in the Psalms, and lifts up its heel against the Bill. It is impossible to apply any adequate remedy to floods, if no one but those immediately affected is to contribute a penny towards their repression. If the burden is thrown exclusively on the holders of the land which is periodically covered with water, it usually turns out that they have neither the means nor the will to bear it to any good purpose. They probably know too well to what the prevalence of floods in later years is attributed to be inclined to relieve the more fortunate landholders who live beyond the reach of the mischief from doing their part in keeping the river within bounds. It is now universally understood that the improved drainage of the land in a river basin is the main cause of floods. The rain is no longer suffered to lie where it falls. Before it has soaked into the ground it is carried from one drain-pipe to another, and from smaller brooks to larger, until in no very long time it reaches the river into which these brooks empty themselves. The river has no means of disburdening itself of these superfluous contributions except by throwing them back upon the land. In this way those who live on its banks suffer by reason of the excellent drainage applied to the estates lying on a higher level. It is bad enough to have to submit to this when it comes as a natural calamity, but it is more annoying still when it comes in the form of taxation. There are many people probably who would stand any amount of loss by the overflow of a river rather than prevent that loss at their own sole charge. The destruction done by the water irritates them less than the sense that, though the higher lands are equally guilty as regards the mischief done, they are not to be charged with any portion of the outlay necessary to ward it off for the future.

The objection taken to the Bill by the Duke of SOMERSET—that, since every farm in England is either upland, midland, or lowland, the Bill gives the Local Government Board power to tax every farmer—is hardly marked by its author's usual ingenuity. There are a great number of farms which in reference to floods cannot be said to come under any one of these heads. They are too far away from any river to stand in any real relation to its overflow. In fact, it is only by using the term with an exaggeration of geographical precision that they can be described as lying in a river basin at all. There seems no reason therefore for the Duke of SOMERSET's alarm lest every farm, no matter what its situation, should be included in some basin or other, and so forced to contribute towards the expenses of the Act. That a good number of people will be forced to

contribute who now repudiate their liability is likely enough. But, so far as they are benefited by the improved drainage of late years it is strictly fair that they should contribute. The floods, which often make the cultivation of the low-lying lands a dead loss, are partly caused by the withdrawal of the water from the higher lands. As these latter are rendered much more profitable by the process which does injury to their less happily-placed neighbours, it is a matter not of kindness, but of justice, that the possessors of the uplands should bear their part in the outlay which is necessary to prevent their gain from being the loss of others.

It is a better-founded objection to the Bill that, while it taxes the owners and occupiers of the lands which the floods injure, it does not tax the owners of the mills and dams to which much of the injury done is really due. Lord CAMPERDOWN pointed out that the Bill is so far from making this class of owners bear their fair share of the burden, that it actually proposes to compensate them for any loss they may incur by the removal of their dams at the instance of a Conservancy Board. Unfortunately, there are few questions upon which experts seem more hopelessly divided than the operation of artificial obstructions to the course of a river. They are alternately represented as the principal cause of floods and as the one thing which has prevented floods from being much worse than they have been. Possibly the Government have satisfied themselves that the arguments on each side are not equally balanced, and that there is more reason for exempting millowners than there is for including them. In that case they ought to be prepared with conclusive evidence in support of their opinion; for it certainly is not one that they are likely to find taken on trust.

It is difficult to follow Lord CAMPERDOWN's argument that the storage of water is a purpose that ought not to be included in a Bill for the prevention of floods. To us the two objects seem connected by the most natural tie possible. It will be the business of the Conservancy Boards to be created under the Bill to get rid of the superfluous water brought down by the rivers over which they severally have jurisdiction. The most natural and obvious way of carrying out this end will be to enable the river to carry away the water as rapidly as possible, and with this view the Conservancy Board will naturally do all it can to deepen the bed and quicken the current of the stream. But this very water which is a nuisance at one season of the year may be eagerly coveted at another season. The same perfection of drainage that has contributed to winter floods has equally contributed to summer droughts. The rain is carried off before there is time for it to soak in, and the result is that the springs are deprived of much of the water that used to find its way to them. Under the Bill as it stands the Conservancy Boards are enabled to remedy both forms of the evil; under the Bill as Lord CAMPERDOWN would make it they would only be able to deal with one of them. If they are not to have any power of providing for the storage of water, they must necessarily be accessories to its waste. They will have to decide what shall be done to prevent it from flooding the lands in the basin of a river; and, if they are not allowed to keep it in some safe place until it is wanted, they will be compelled to send it on to the sea with all the despatch they can command.

In the present state of public business, the most fortunate Government measure cannot count upon becoming law this Session. But, as the Bill is before the Lords, it is much to be desired that it should receive very careful attention. There is no reason to suppose that from this point of view a Select Committee has any superiority over a Committee of the whole House. As, however, the Government did not feel themselves strong enough to disregard the suggestion, there is no more to be said. We must only hope that what promises to be a useful Bill will not come out of the ordeal so changed that its own parents will be unable to recognize it.

MACHINE GUNS.

THERE can be no doubt that as we multiply new weapons of destruction, and as the possession of some at least of these in abundance and perfection by an army in the field becomes increasingly necessary, we are gradually being brought to face one of two alternatives. Either the carriage accompanying an army must grow to alarming proportions, or everything will have to give place to transport of man-killing material. In the latter case

all that is, not absolutely required for immediate use must be stored at the base, or at some early stage of the operations. But we are at once arrested by the difficult question as to the mode of transport of soldiers' personal effects. A soldier carries with him proportion to his mobility—the mobility of individuals. A soldier standing in heavy marching order on parade impresses one with any idea rather than that he is, when thus equipped, in good condition for doing prolonged active work. He is evidently gored by what he has heaped on his back, stretched to his sides and stuck on here and there in front. The soldier shows his thorough appreciation of this fact by pitching all but bullet and bayonet right and left when the tug of action approaches. Some persons, therefore, advocate consigning his knapsack and kit to his waggon, and would load him instead with extra cartridges, three or four days' ration, and an entrenching tool or part of one. Others say, if the men's kits were carried for them, they would not get them when wanted, and that, at any rate, the measure would add to the already heavy encumbrance of the transport train. One thing, however, is certain—that, after providing for the men's mouths, everything else should give place to the necessity of supplying them with means for destroying their opponents. They must never be separated from their reserves of ammunition, nor from their entrenching tools, which are almost as valuable as rifles; they should be able to carry their three or four days' prospective rations, and they require waterproofs for the bivouac. But the subject of readjustment of burden as between men and waggon, or pack animals in the matter of carriage of soldiers' personal effects, provisions, entrenching tools, becomes of minor importance when we look to the growing wants of armies in the matter of the *matériel* of destruction. Various devices are now used for the compressing of food, both for men and animals. A tiny block of stuff having the appearance of granite, and almost as hard, expands in boiling water into succulent vegetable. Other little blocks resolve into nutritious soup. Sausage-meat is jammed together till it really becomes what is termed in culinary science "forced-meat balls." A large quantity of hay is compressible into a very small space. All these expedients bring relief to the transport train, and, what is equally important, allow of a soldier carrying upon his person several days' rations. That which is to preserve life, then, is becoming more portable; at the same time, that which is to destroy is ever demanding increased carriage. The multiplication of methods of destruction entails corresponding provision to allow of various action, rapid use, incessant wear and tear. Formerly there were guns and muskets of simple pattern and slow action, to supply which with enough powder and shot was a comparatively easy matter of calculation. In front of earthworks more formidable guns are now needed; larger projectiles will take up more room; there will be a far greater abundance of these, seeing that fire is now opened at much longer ranges. Breech-loading and repeating rifles make away with a colossal total of cartridges; and it may be said, without exaggeration, if the advocates of extreme long-range infantry fire have their way, it will entail the carriage for a single brigade of as much ammunition as would have sufficed in "Brown Bess" days for a whole army. Again, we have not only the old arms improved, but others of a new type—machine guns in various disguises. Batteries of these take up space on the line of march; the carriage of their reserve ammunition will absorb nearly as much transport as that of field batteries; for mitrailleuses and revolving cannon expend at a furious rate. Were a battery of Gatlings to fire away for one hour, it might easily get rid of three hundred thousand rounds. Then the Hotchkiss revolver shell-gun for field service has, when mounted on its carriage, about the same weight and size as an ordinary cannon. A battery of such in action might discharge, without using, over haste, each minute over 400 lbs. of iron. All these instruments require space, and they require transport; animals must drag the batteries and animals must draw ammunition for resupplying them, and these beasts must be fed from carriages drawn by other beasts. It is evident that, just as we want to reduce our incumbrances, the necessity becomes greater for adding to them—that is, if it is necessary to provide armies with all the latest fashions in inventions. Hence it becomes a matter of primary consequence that we should ascertain which instruments serve our purpose best, that we may discard others which take up equal room and much transport. If we can get the value of one gun out of another, let us not be encumbered with both. At any rate, we shall be rid of the inconvenience, often attended with confusion, of having to provide at the right time and place different ammunition for different systems. Inventors are much given to pointing to railroads as the ready means of conveying and distributing their productions. We are told that rapid-firing guns and rapid means of transport go hand in hand, and there is truth in this remark. But armies move away from lines of rail, and lines are blocked or destroyed, and when in working order have plenty to carry without conveying one set of instruments when another would do better.

The possibilities of the mitrailleuses have long ago been ascertained; but as some of its advocates back it so stoutly it may be as well very briefly to compare machines of that type with revolving guns, with which latter we are here more immediately concerned. The great practical difference between the two is that, while the second propels shells which burst at certain distances, the first discharges solid shot. The mitrailleuse delivers a hail of balls of small size utterly destructive of all upon their path. However scattering motion may be given the volley of bullets, the balls only take effect along their line of flight. The revolver-gun dis-

charges successive single shells, the fragments of which on explosion fly more or less like radii to the rim of a circle. Though the mitrailleuse sets several barrels simultaneously in action, and the shell-gun only one at a time, yet, from the shell revolving itself into many pieces, to get in the same interval an equal number of missiles with the mitrailleuse, this gun must be manipulated with far greater rapidity.

There are several patterns of machine guns of which perhaps the best known are the Reffye, Montigny, Gatling, Hotchkiss, and Nordenfeldt. They are designed with variations for different uses; some being for field service, some for employment afloat, others for employment in fortifications. The Nordenfeldt is not on the revolver principle; the Gatling is an improved mitrailleuse; the Hotchkiss is a revolver-cannon. The latter piece has five parallel, or practically parallel, barrels of Whitworth steel, grouped about the same axis. When the mechanism is started the barrels are in turn brought round in front of the apparatus, which successively loads, fires, and takes out the spent cartridge. That is to say, a simple turn of the hand—the machinery being worked with the ease of a barrel-organ—suffices to load one barrel, fire another, and extract a cartridge-case from one more. It would appear at first sight as if the action of the piece must be necessarily slow, but the speed at which it may be worked depends less on manipulation that gives the rotary motion than on a constant supply of cartridges being at hand. When the gun is "fed" quickly, but without hurry, some sixty shots per minute may be easily fired. The missiles vary with different requirements. In the navies of several foreign Powers solid shot is fired from the Hotchkiss. For field service an explosive shell discharged with percussion fuze is used, and canister may also be employed. On board ship it is necessary to have missiles possessing perforating power for employment against boats, especially torpedo-boats, rather than those which scatter over a wide area. What we require in a land fight are missiles with disseminating action, missiles which will resolve into fragments numerically sufficient to search out all within a certain zone, and yet not too minute. Each fragment should be powerful enough to substantially maim man or horse, not necessarily to kill outright. It pays better, as has been said, to maim than to kill, for a wounded man requires looking after. The claim made for the Hotchkiss one and a half-inch revolver is that one of these will fire at least sixty shells in the minute, each bursting in some twenty or more pieces having size and momentum sufficient to materially damage, and of course often destroy, both man and horse. A battery of these guns—a battery of thirty barrels—would be able then to disseminate in one minute about eight thousand shell-fragments; and, with ammunition at hand and well served, there is no reason why a continuous discharge should not be maintained. The effective range is up to 3,000 yards.

Some of the advantages urged for the Hotchkiss over the ordinary mitrailleuse may be briefly summed up thus:—The former uses explosive shell, which creates a striking moral effect, and the destructiveness of which is spread over a wider area; the mechanism is simpler; the machinery does not require rapid manipulation; and it stands wear and tear well. Moreover, a less amount of ammunition is required to produce the same effect. The shock of discharge also is better distributed; or, rather, it is concentrated so as to bear upon the mass of the piece itself, and not upon the machinery—an important point this when the sequence of shocks is incessant and rapid. Opponents and rivals of the system we have touched upon above urge, on the other hand, various objections to it. The Hotchkiss fires one shot at a time; true that is a bursting shell, but it is the discharge of a single barrel, and it is argued that volleys of bullets from multiple barrels have a wider parallel of effect. Then it is said the solid bullets of hardened steel give more penetration than fragments of shell; but this objection is of minor importance in the field, seeing that shell-morrels or bullets would serve equally well for maiming and disabling, but would neither of them do appreciable damage to material. Again, the advocates of the Gatling say that a small gun on that system will up to 1,200 yards secure more hits in the same time than any Hotchkiss of whatever size. And a defect is alleged against the machinery of the latter, that if the extractor which takes out exploded cartridges, failed to act by drawing off the head of the cartridge, the machine would be brought to a standstill till the obstructed barrel was cleared, the other barrels not being capable of separate manipulation. The defect, however, is very soon remedied. Furthermore, the Gatling people assert that, when all is said the Hotchkiss reproduces with but some small variations the leading features of their own system. Dr. Gatling was, we believe, the first patentee of machine guns, which he introduced nearly twenty years back. He was the first, if not to entertain the idea, at least to produce a gun capable of continuous firing from barrels practically self-loading. He may fairly, therefore, lay claim to have set other persons' wits to work, and if they improve upon his invention, it does not detract from his credit, and they deserve all of them. No invention, of whatever merit or utility, is of such finished perfection as that some one coming after may not add some touches. Especially is this the case with first inventions of their kind. Inventors, however, seem haunted by a dread that the "chance" will be taken out of their innovations if any one adopts them with a difference and pushes the design a bit further. The truth is, that the greater the number of clever people who swoop down upon an invention and try to create a patent for themselves by giving it a novel twist, the more is the credit which is due to the man who sug-

gested to these clever people their occupation. Dr. Gatling's reputation speaks for itself; but it is also distinctly creditable to some others that they should have foreseen and provided for the necessity of having machine guns of larger calibre than he had suggested, or, at any rate, had made. Moreover, the Hotchkiss gun has striking points of difference from the Gatling and most other machine guns; one of which—the distribution of shock on discharge—we have referred to; and another is that all the barrels in the former are worked by one set of mechanism, but in the Gatling, at least, each barrel has its own machinery.

What the public is interested in is not the degree of merit attaching to one inventor or another, but the amount of profit to be derived from adopting one or other, or all, of their inventions. The question here is not one of calibre, but of system. Guns may be built up of any calibre on any system. There is nothing to prevent Dr. Gatling constructing a bigger machine than the largest produced by Mr. Nordenfeldt or Mr. Hotchkiss, and either of these gentlemen might then turn the tables on Dr. Gatling. But which system may be expected to give us greater results, or must we utilize both, or need we adopt either? Shall we take a piece concentrating in itself as many rifles as would fire continuously a thousand rounds a minute, or do we think the rifles can dispense with its aid and give of themselves more varied effects? Must we adopt the revolver cannon when field artillery gives us a larger shell and further range? But, first, as regards shell *versus* bullet.

It is plain that when employed against scattered formations the shell would be more efficacious than the hail of bullets; on the other hand, the latter would plough a lane through any closed body. But where are we likely to come across closed bodies? The tendency everywhere now is towards open formations. What is needed, therefore, is dissemination of missiles. The shell strikes out right and left, the solid bullets go straight ahead. Over a limited area like the deck of a vessel we can readily believe in a storm of bullets being much more certainly destructive than a shell with an equal number of fragments; but a field of battle is a wide space. The occasions must be rare where the fire of a skirmishing line would not, with the same expenditure of ammunition, create much more effect than would a mitrailleuse. There are cases, of course, when the latter might be used with grand results—for instance, against cavalry in closed bodies, on men rushing together to storm, on columns at a distance which had not resolved themselves into units, on a baggage train in enfilade. The question is, whether to meet these cases it is necessary that a force should be equipped with mitrailleuses or any gun propelling a mass of solid bullets, or whether we have not in cannon and rifles what will suffice for all emergencies. As to revolver-guns, their case stands upon a different footing. It was observed they meet one exigency of modern war—the necessity of scattering projectiles in order to meet scattered formations. But field-guns firing shrapnel do vastly more damage at every range than revolver-guns can possibly effect. What special advantages, then, can be urged on their behalf? First of all, a revolver does not require so many men for its service. It presents, therefore, a smaller mark. Its ammunition is more portable, more compressible, more manageable. Its fire is far more rapid. The big guns, however, must always be the principals, the small ones taking minor parts; while the former have the length and breadth of a vast square under command, the latter will serve admirably to fill up the interstices. *Qui brille au second s'éclipse au premier*, and many inventors would gain more lasting credit than they do if, instead of puffing their productions into a higher position than they can maintain, they would exhibit them in those aspects where their advantages are undeniable. It is the same with theorists who push doctrines to extremes. We remember well how after the Crimean war enthusiasm was extravagantly aroused about the effects of the Enfield rifle, and young officers fresh from the musketry course at Hythe declared loudly that artillery was "done for." It was of little use to urge that the introduction of rifled cannon was the logical deduction from that of rifled muskets. Two years later found rifled cannon in actual use in a great war. And now some persons would have us believe long-range infantry fire is to accomplish everything.

It would be worth the while of any who have doubts as to the part artillery will play in war to refresh their memory by the perusal of Dr. Russell's ever-memorable story of the battle of Sedan. Again and again does the writer revert to the effects, moral and physical, wrought by the crushing cross-fire of the German guns. The French cannon fire was reduced to impotence, while their infantry, brave as they were, cowered and quailed before the ceaseless storm. It is not only that men pounded with cannon, searched out by shell fragments even behind *épaulements*, suffer actual loss, but they become incapable of using their own weapons with effect. Since Sedan rifles have improved a little, but guns have improved a great deal more. The truth is that so many changes for the better are being effected in all connected with artillery—with the piece, its weight for power and abatement of recoil on discharge, with the cartridge, the shell, the powder, the range, attainment of accuracy at great ranges—that it is a question not how guns shall meet rifles, but rather how the latter may be improved to meet perfected artillery. With this latter arm we must now, we think, associate the revolver-cannon—not necessarily the Hotchkiss, though it must be allowed the system of that inventor is at present unsurpassed. As regards calibre, it should unquestionably be very moderate for field work. The gun is in no sense to be looked on as a rival to the ordinary field-gun. It is

simply and solely the complement of that piece. Skirmishing riflemen, supports running up to reinforce these, scattered troopers, marks which the big guns would be too occupied to notice, or be above noticing, all such the revolver is well calculated to take account of; while within its more limited range it would cause serious losses among any formed body. Of the several problems which the next European war holds in store for solution there are few more curious and more important than what is to be the result of vertical rifle fire as against that of the perfected shrapnel combined with the revolver shell. Where so much is uncertain, it is absurd to dogmatize, and the most we can do is not to begin with a theory, but work up logically by slow steps till we arrive at one. We ourselves have got little further than the recognition of two facts in the controversy—one of which is, that both cannon and revolver-cannon have a greater reach than rifles; and the other, that at distances where rifle fire can only be delivered with the vaguest idea of the locality where the bullets will descend, the former can still plant their shells with very destructive accuracy.

An army equipped with field-cannon and revolver-cannon can scarcely need the aid of any sort of mitrailleuse. The interstices of a battle-ground are sufficiently well filled without it. Solid bullets from machine guns propelled straight ahead, or with only slightly scattering action, are excellent against masses within their parallel of action; but we want that parallel to lie the other way—right and left, left and right—and we get much of this effect with the revolvers shells. The former weapons are luxuries, rising to the dignity of necessities perhaps in other places, but, in our view, may safely be dispensed with in a *bataille rangée*. And, as was observed above, the incumbrances of an army must be reduced to a minimum if that army is to possess due mobility; in that minimum it would be difficult to find a valid reason for including any sort of mitrailleuse firing solid shot.

AMERICAN AMENITIES.

AMERICA has sent us several accomplished actors. It is commonly supposed that criticism thrives where art is successful, and therefore we might expect to find excellent criticism of the stage in the country of Mr. Booth and Mr. Jefferson. And yet, when we read the American theatrical critiques, we seem to miss that delicacy and urbanity, that fine reflectiveness and precision, which it was natural to look for. *Nym Crinkle's Feuilleton* is the name of an American journal, devoted to the best interests of the stage, which lies before us. The title is a little odd. We readily see what Nym has to do with the whole art and mystery of publishing as practised in the United States. "They will steal anything, and call it—purchase," as the Boy says of Nym and his companions. As to the name of Crinkle, we fail to see the humour of it. But a paragraph in *Nym Crinkle's Feuilleton* tells us "what Forney thinks about it." Forney thinks that "*Nym Crinkle's Feuilleton* ought to succeed. The stage should support such a paper as Mr. Wheeler (Nym Crinkle) publishes. He holds the very first rank among New York critics, and is, perhaps, the most brilliant writer of them all." If Forney thinks this it must be all right, and we are justified in regarding Mr. Orinkle as the foremost of the critics of the American stage.

So brilliant is Mr. Orinkle that the coruscating radiance of his style dazzles the mere European, even if he has accustomed himself to the gorgeous manner of the theatrical critic of the *Academy*. That writer appears to have excited some envy in the breast of Nym Crinkle. "Poor Oghlan," says Nym, "has been mangled in the London *Academy* for his representation of Corrado in *La Mort Civile* (*sic*), for, says the merciless critic, 'it is hardly to be accounted either faultily faultless, or icily regular.'" This is immense criticism; but Mr. Orinkle himself uses language which seems beyond even the opulent resources of the London *Academy*. He has to complain that the newspapers did not notice a certain performance of Miss Anderson's. "Every daily paper dodged it. Even William Winter, Esq., could not stretch his taffy sufficiently to cover its magnificent unfitness, and so gave up the job." This is like the obscure glow of the style of Tertullian, which has been compared to the polished darkness of ebony. There is no mistake, however, about the significance of a friendly notice when it appears in the *Kansas Times*. Thus we read that "Emma Abbott is coming this way—pretty, cosy, lovable, vivacious, bewitching, kissable little Emma Abbott. She is coming with her bird-like voice, her sunny face, her fair hair, her sweet smile," and a great deal more. The catalogue becomes, like a suppressed volume of *Saint-Beuve's*, as described in a bookseller's catalogue, *étonnamment intime*. In spite of this favourable notice in the *Kansas Times*, *Nym Crinkle's Feuilleton* takes a sterner view of Miss Abbott, whom it calls "the gushing proxyssmal Emma." We have always supposed hitherto that the most personal and unsparring criticism in the world was that applied by sporting reporters to the individual members of the University crew. "Five feathers abominably under water," "three does not pull the weight of his boots, and is a mere passenger." But actors and actresses are frankly told by Nym Crinkle that their playing is "vile."

Even when players are off the stage, Mr. Orinkle "stretches his taffy," as he would say, so as to bring them within the range of that instrument; for "taffy," we presume, is a New York scientific term for a telescope. Thus, in writing about Shakespeare and the

modern stage, Mr. Orinkle has to mention what he takes to be the opinion of Mr. McCullough. This is how he does it:—

If ever you should meet John McCullough late at night at Delmonico's, eating deviled lobster with the gusto of a Gosh, and the gentility of a god, he will tell you, with inimitable suavity, and delightful confidence, that the people flock to his performances because of their love of Shakespeare.

If Mr. McCullough can preserve his suavity and modesty in a country where the most brilliant critics write in this style, it is impossible for any circumstances to spoil him.

The Greek philosophers thought that a city should never be so large but that all the citizens might be personally acquainted with each other. Large as the American democracy is, the citizens seem all to be on the most familiar terms with every one. The aristocratic title of "Mr." is dropped in the newspapers, and all men and women are spoken of by their Christian names or nicknames. This affectionate familiarity is extended even to natives of the old European States, where people are not so truly brethren, and do not so frankly regard each other as children of one great family. The *Feuilleton*, for example, has several columns of paragraphs, each paragraph being headed by the name of the person concerned. Thus we read:—"SARDON.—Victorien Sardou is wintering at Nice." Here, again, is information about Mrs. Olaxton's public engagements and private sorrows, conveyed in this delicate and sympathetic manner:—"OLAXTON.—Kate Olaxton is billed for Albaugh's Holiday Street Theatre, Baltimore, next Monday. Poor Kate Olaxton is still overwhelmed with the loss of her only child, who died in Albany on New Year's Day." His Majesty the Democracy's servants are not treated with very tender consideration:—"NABBY.—Petroleum V. B. widow, the relict of the late Bedott, will exhibit herself nightly at the Fourteenth Street Theatre, under the protection of Col. Haverly." This bereaved lady is spoken of with no more gentleness than—"KNOX.—The learned pigs of Professor Knox have been a feature at the New York Aquarium." And what can be meant by the dark saying that Herr Sontag is "an actor full of vim"? As to a lady now playing with much applause in London, we are informed by the brilliant Orinkle that "she has dropped the Countessship gag." After reading these paragraphs, and others which we do not reproduce for very good reasons, we find out what Mr. Orinkle thinks of what he calls "Esthetic criticism." "Esthetic criticism is not a science. No one has ever succeeded in formulating its laws. Current criticism is the expression of individual taste," and we have seen the freedom of the individual taste of the untrammelled Mr. Orinkle.

The *Feuilleton* is not very particular; but American journalism is no longer what it was. The press of that country is, we imagine, becoming "Europeanized," and personal remarks are no longer so common or so malignant as of old. We have recently chanced to pick up a brief history of the American press, a statistical and detailed account of the fights and floggings of American editors, which is not disagreeable reading. The first American newspaper duel was fought as long ago as 1785. Matthew Carey met Colonel Oswald; they fought with pistols, near Philadelphia, and Carey was severely wounded. In 1804 Cheetham, of the *American Citizen*, challenged Coleman, of the *Evening Post*. Coleman not only wanted to fight, but proclaimed his martial eagerness in his newspaper, thus inducing the police to prevent the battle. This conduct caused Captain Thompson to praise Coleman for his Christian meekness. Coleman could not endure being called a Christian, and the parties met in a snow-storm. The failing light made it impossible for them to see each other distinctly at ten yards' distance, so they gradually advanced, till Thompson, exclaiming "I've got it," fell mortally wounded, and left the victory to the Christian warrior, Coleman. In consequence of a newspaper row, Mr. Pettis challenged the shortsighted Major Biddle. Biddle refused to shoot at a longer "rise" than five feet, and both fell at the first discharge. When the intrepid Cumming encountered the aristocratic M'Duffie, the former wore a light blouse and trousers of cotton, while the latter was dressed in silk. M'Duffie's bullet entered the ground within four feet of his own toes, but Cumming's was more skillfully directed, and struck M'Duffie under the short ribs. When the lamented Oiley, again, in consequence of newspaper criticism, fought Mr. Graves, the weapons selected were rifles. The men were posted at a distance of ninety-two yards, and, at the second discharge, Mr. Oiley was shot through the body. Colonel Webb, of the *New York Courier*, was hit by Marshall in the leg, and was afterwards put into gaol. Mr. Bennett, of the *Herald*, sent Webb (an old enemy) a box of cigars, but Webb, in spite of the bullet in his leg, kicked the weeds out of the room. Woods, of the *Kansas Democrat*, libelled young Levi Coleman, a minister of the Methodist persuasion. Woods also assaulted Coleman in the street, kicked him, and pulled his evangelical nose. All these insults at the editorial hand Coleman bore with Christian patience. What happened? Why the Methodists of Little Rock, like one believer, deserted and boycotted their lately respected pastor. He was coldly dismissed by a young sister to whom he was betrothed. The bruised Methodist will turn, and Coleman accepted a challenge from Woods, then esteemed the most dangerous pistol-shot on the American press. Pistols were the weapons, an "unusually large and coarse assembly" to see the parson shot, and the Methodist killed the newspaper bully at the first fire. The Rev. Levi Coleman was now admitted to the best society of Little Rock. But his victory lowered his moral tone; he became a literary capable writer, and

an adept in the use of the pistol. Frost, of the *New Orleans Crescent*, fought Colonel Hunt with double-barrelled shot-guns, at forty paces. The newspaper man was hit, and died within half an hour. Much satisfaction was expressed, in San Francisco, when Alderman Cottage "put over" the editor of the *California Herald*. What we think a very unfair duel was fought by two newspaper editors near New Orleans. The conditions were that the men should be put up at fifteen paces. They were to draw for first fire; the man who won was to shoot, so to speak, from "scratch," and his opponent, if not disabled, was to walk in ten paces, and fire. Cohen, who drew the lot which entitled him to first fire, missed, when his opponent marched up ten steps, and shot him through the body.

People who gave their minds to the subject determined that flogging, not duelling, was the proper treatment of disagreeable editors. "A member of the New York Legislature lately attempted to pass an Act to legalize the flogging of editors, in certain cases, with the proviso that no bones should be broken in the operation." So says a historian of the American press, who adds that "the very instrument of correction, be it a blue cow-akin or a hickory cudgel, becomes an object of affectionate interest." In 1836 a Colonel Webb assailed the late noted editor, Mr. Bennett, and "cut a gash in my head" (says the sufferer) "one inch and a half in length, and through the integuments of the skull." Nine thousand extra copies of the *Herald* were sold—thanks to the touching description of what seems to have been a sufficiently cowardly assault. On a second encounter with Webb the gallant editor's "casualties" were a scratched finger and three buttons missing. "His loss is a rent from top to bottom of a very beautiful black coat, which cost the ruffian forty dollars." Here is another account of a newspaper row. "Laseter repeated," says Mr. Dwyer, an able editor, "that we were a liar and a blackguard, whereupon we did take our inkstand from the desk, and hurled it in his face." A fight ensued in the office, and a gouging match in the street. A Mrs. Lyons horsewhipped the publisher of a Cincinnati paper called *Town Talk*. Judge Blair poked his umbrella into the eye of Pickering of the *St. Louis Union*, but Pickering shot the learned judge in the leg. Lastly, as an instance of the resentment of a tragedian, be it said that Mr. Edwin Forrest knocked down N. P. Willis and beat him with a whip. And yet theatrical criticism in America seems still to lack delicacy and refinement.

TEL EL AMARNA.

STUDENTS of religious history are acquainted with numerous attempts to prove that the ancient Egyptians were monotheists. The course of reasoning pursued in these essays is somewhat as follows:—The Egyptians worshipped everything; everything is singular; therefore the Egyptians were monotheists.—Q. E. D. If this syllogism fails to convince the sceptic whose common sense is above logic, the name of Amen is introduced, and he is silenced by a demonstration that Amen was the supreme deity of whom all the other gods were mere aspects or attributes, and that if Romanists and Mahometans, with their worship of saints, can be called monotheists, the cult of minor objects of veneration cannot be considered a violation of the great principle of monotheism. To this, however, many answers may be given. The writers who advance such arguments have not sufficiently defined their terms. What do they mean by "ancient Egyptians"? An Egyptian monarchy was founded by Meny or Menes at a very remote period, and subsisted during the reign of six dynasties of kings, after which period it disappears from history. If this Menian kingdom is intended by the phrase "ancient Egyptians," we may assert positively that there is no trace of monotheism among them, although Pharaoh is worshipped as supreme among the gods, and that Amen is not so much as named in any of their inscriptions. Some five centuries at least after the fall of the Menian monarchy a new kingdom, known as the Twelfth Dynasty of Manetho, arose. Its religion differed in many respects from that of the former monarchy; but, though the name of Amen occurs, there is no trace of monotheism, and Amen is not very widely worshipped, though, under the form of Amen-Chem, a temple at Karnac is founded in his honour, the earliest temple erected to any but a king of which the remains have come down to us. The more striking differences between the religions of the two kingdoms are these:—first, that the king is no longer venerated as the supreme deity under the Twelfth Dynasty, as in the early period; and, secondly, that images of the gods are permitted. If these, then, are the "ancient Egyptians" of the monotheistic argument, it is plain that the theory will not square with the facts. The Twelfth Dynasty fell, and we have little or nothing to guide us for another dark period of five centuries, when a new monarchy was founded by the kings of the so-called Eighteenth Dynasty. This new monarchy has the advantage over its predecessors in that we can approximate to a date for it; and, though that date is enormously remote, yet it is tolerably certain. The beginnings of the Eighteenth Dynasty must be placed more than seventeen centuries B.C., or soon after the time of Joseph, according to the Ussherian chronology. Are these the "ancient Egyptians"? What is their religion? Does it present monotheistic features? To put the answer briefly, it does. But these monotheistic features are very different from the pantheistic ideal of the essayists to whom we have referred. The

old religion was not revived, though the names of many gods were retained. A new doctrine of a future life was taught. The name of Amen was united with those of the principal divinities worshipped. The great "Osirian myth" was formed. Temples and images were frequent. The king, still called divine, was now rather a priest than a god. In short, if these are the "ancient Egyptians," it is barely possible to trace, partly in the numerous attributes of Amen, and partly in the similarity, or it may be the confusion, of the different deities, a kind of rough monotheism. But before the end of the Eighteenth Dynasty a real and unquestionable form of monotheism was introduced, and one of the most singular revolutions which history records took place. Its monuments are to be found at Tel el Amarna.

Amenhotep IV. was the ninth king of the new monarchy. His family was firmly seated on the throne—so firmly, that when his father, Amenhotep III., brought home the beautiful foreign maiden Thya to be his queen, he was able to make her the partner of his power, and to leave her the reins of government at his death. As guardian of her son she was supreme in Egypt. No one who has seen the fragment of her white marble bust discovered under the floor of the Osiride Hall at Karnac, where no doubt it had been cast in contumely after the fall of her posterity, can doubt that she was, not only lovely to look upon, but a woman who could rest content with nothing short of absolute power, and who was eminently capable of attaining her ends. There is only the face left. The crown is broken off. The neck is almost gone. But the marvellously expressive face is intact. When the iconoclasts came into the sanctuary of Amen-Chem and cast down the graven images of the heretic Queen and her son, and brake in pieces their carved statues, we can imagine that even fanatical hate spared to strike the face; and, after the lapse of three-and-thirty centuries, it smiles on the visitor to the Boolak Museum, as Thya smiled on Bek and Putha when they submitted to her the plans and adornments of the new city which her son was about to make the capital of Egypt. Thebes was to be disestablished. The gods of Thebes and of Memphis were to be disendowed. The Queen had succeeded in the great object of her life. She had humbled the proud priests and discouraged the filthy rites of Chem. A purer faith, the worship of the Sun, was to supersede the old idolatry of birds, beasts, and fishes—the gods against whom a few centuries later Moses protested, the things in heaven, and in earth, and in the waters under the earth. The sculptor has caught her expression in the hour of her triumph.

Whence Thya brought the worship of the sun's disk has not been ascertained. She was not an Egyptian, but we know not what she was. The old superstitions must have been very deeply ingrained in the race, or the effort to throw them off would have been more successful. Modern Egyptologists have attempted to divide the gods into triads by way of simplifying the mythology; but the attempt has not been very successful, to judge by Dr. Birch's list in the British Museum Catalogues. He enumerates several "local triads," but makes each of them to consist of four deities! Nor is the attempt in the same work to divide the Egyptian gods into orders much more fortunate. We are told that there were eight gods of the first order at Memphis, and nine are enumerated. We are told, further, that there were eight at Thebes, but eleven are named. "The gods of the second order were twelve in number; but the name of only one, an Egyptian Hercules, has been preserved. The third order is stated to have comprised Osiris, who, it will be seen, belonged to the first order." So says Dr. Birch, and it may be as well to confess that his words fall on our ears like idle tales. They convey no meaning, no impression but a confused one. If the chief Egyptologists of England can make no more than this of the mythology of Egypt, we need not feel surprised that to bring order out of disorder must have appeared hopeless to Thya and her contemporaries. The young King, her son, to judge from his portraits, must have been weak, vain, possibly half-witted, and she was able to do with him as she pleased. The triads and the orders, "the Egyptian Hercules," and the double Osiris, all were swept away at a stroke, and Egypt became monotheistic. Had Amen been a god, in the ordinary sense of the word, he might have retained or at least sought for his place. If the object of the Queen was to get rid of the multitude of gods, he, as supreme, might have sufficed for her. But it is extremely doubtful whether Amen was looked upon at that time as a personal divinity, and much more likely that he was merely the idealized expression of some attribute characteristic of all the gods. The Hindoos have thus deified prayer, and Amenhotep IV., in the early days of his orthodoxy, may have seen no trace of monotheistic doctrine, or anything like it, in the addition of this name to the older names of a hundred idols. Yet we read in numberless books that the priests of Amen were offended at the reformation; that Amen of Thebes revenged himself on the family of Thya, and so on. There was, however, as a matter of fact, no such god as Amen of Thebes at that time, but both Noom of Thebes, the ram-headed god, and also Chem of Ggypt or Coptos, had temples there, and were respectively worshipped as Amen Chem and Amen Noom.

There has been a good deal of speculation as to the identity of Amenhotep IV. with Shoo-en-Aten, or the "Slave of the Disk," but the chief authorities believe the two names to relate to the same person. His very peculiar physiognomy, his "unnaturally long chin," his Jewish nose, and thin, slight, effeminate figure—to quote Mr. Stuart's description—are sculptured at Tel el Amarna with a fidelity to nature verging on caricature. The stiffened canon of proportion under which the Memnon in the plain of

Thebes, and the reliefs of Dair el Baheri in the Lybian mountain had been produced, is here thrown aside. Bek, "an artist and teacher of the King himself"—we quote from Dr. Brugsch's translation—"an overseer of the sculptors from life," has left us a series of most remarkable scenes from the Court of Shoo-en-Aten. They are to be found sculptured on the walls of some rock-out tombs in the mountain behind the site of Shoo-en-Aten's capital. The King's own tomb has not yet been found. When it is, we may expect to see Bek's work at its best. But in the two or three grottoes now we have Shoo-en-Aten reviewing his troops, blessing his courtiers from a balcony, receiving ambassadors, inspecting public works, and, particularly, receiving with befitting ceremony his august mother, the beautiful Queen Thya. By him stands his wife, and, behind her, four daughters, all destined eventually to succeed to the throne of Egypt, and to confer on their respective husbands the dangerous and fatal title of king. A few years later Shoo-en-Aten's family is extinct. The descendant of a junior line, Hor-em-heb, has brought back the old worship. Amen Chom has avenged himself upon Aten. The priests of Thebes have triumphed, and hammer out the hated cartouche of Amenhotep IV. from the sculptures of Karnac. They pull down his obelisk and use the pieces to build a pylon. They overturn his mother's statue, and set up in its stead the statues of the hundred gods destroyed by her and her son. Hor-em-heb had "a hundred images made, one for each of them, of like form, and of all kinds of costly stones." The city, Shoo Aten, disappeared as quickly as it had arisen. The tombs were filled up with sand. The temples became heaps, and the very memory of the revolution was blotted out until the recent diggings at Tel el Amarna revealed the strange story to the modern world. The tourist on the Nile too often omits to call at Hadji Kandeel—such is the Arab name of a wretched village on part of the site of Shoo Aten. The mounds are close by, and about three miles off, across a flat desert plain, are the dark spots on the pink sides of the eastern hills, which betray to the experienced eye the existence of the tombs. The walk to them is very easy, the desert being hard under foot. The road is marked by rows of stones. The grottoes, of which a few only are accessible, are very interesting from their size and extent as well as their decorations.

THE ECLIPSE OF THE DIVE BOUTEILLE.

WE have before us a document which it is neither an exaggeration nor an affliction to call an extremely melancholy one. It purports to be a return of the exact amount of *tonneaux* of claret produced by each of the classed vineyards of the Médoc district during the years 1875, 1878, 1879, and 1880 respectively. The earlier year is taken as the last instance for the past six years of a good and abundant vintage, while from 1878 to 1880 things went from bad to worse; 1878 was not a bad vintage, but it was far from being an abundant one; 1879 was very much the worst on record for many years, both in quantity and quality; and last year, though believed to be fairly good in quality, was, in point of quantity, almost worse than its miserable predecessor. Nor is there at the present moment much hope of things looking better. Bad seasons may pass, and the number of *tonneaux* of Latour and Mouton may present a less disquieting proportion to the number of mouths that would like to drink them. But the phylloxera is altogether a different host to have to reckon with. Good year may be replaced by bad year, and bad year by good, but where the phylloxera passes, there is desolation. Already the number of acres thrown out of viticulture by this abominable pest—for which two hundred remedies and not one cure have been prescribed—is counted by hundreds of thousands. Departments such as that of the Hérault, which used to produce more than any others, have been most heavily stricken; famous vineyards such as that of Côte Rotie and Châteauneuf du Pape, have almost or altogether ceased to be. The Médoc has suffered less than the wine districts of the South and centre, and there is one faint hope for claret drinkers. Inundation seems to be the only phylloxera cure that is not altogether futile, and most of the Médoc is so close to the estuary of the Garonne, that inundation may be at least in some places applicable. It is pretty certain that any practicable remedy will be tried. A man who has a vineyard which will bring him in of a good year some hundreds of hogheads, which are worth from fifty to eighty pounds apiece, is not likely to spare expense in dealing with it when it is a question of life and death.

But even if the phylloxera should, after the singular fashion of such pests—and especially of its predecessor the oidium—suddenly cease to trouble, it will take a good many seasons to make up for the last five years, of which, as has been said, only 1878, and perhaps 1877, did its duty fairly in point of quality, and none in point of quantity. The figures of our table are abominably eloquent. For some reason—let us hope it is not the phylloxera!—Haut-Brion, the least fashionable, but far from the least good, of the four proud growths that head the list, does not figure here. Concerning the merits of the other three opinions will always differ. Those whose ideal is a light and graceful liquid will vote for Margaux; those who like Bacchus in his majesty rather than in his grace will prefer Latour. Between these, the popular favourite exhibits the good fortune of a happy mean; for Lafite undoubtedly combines the merits of both its companions, though perhaps these merits are not so eminently

present. Now the figures for Lafite are, in 1875, 244 *tonneaux*; in 1878, 177; in 1879, 97; in 1880, 99; the yield of the last two years being as nearly as possible half that of 1878 and one-third that of 1875. The figures for Margaux are very nearly the same, and observe the same ratio; while the yield of the Latour vineyard, the smallest of the three, sank from 150 *tonneaux* in the first year to 52 in the last. With the more numerous, and sometimes hardly inferior, second growths things are as bad, or worse. The famous Mouton Rothschild, which is sometimes confounded by the unwary with a modest fifth growth, Mouton d'Armailhac (a very good wine, too, in its way), and which at its very best yields to no claret that ever descended a human throat, kept level in 1875 and 1878 at 150 *tonneaux*, but sank in 1879 to almost half that number, and last year to 65. The three Léovilles—the Barton being perhaps the best—gave a total of 625 in 1875, of 164 only last year—that is to say, about one-fourth. The admirable Rauzan-Ségla gave its proprietor all but a hundred *tonneaux* in the one year, and a bare thirty in the other. Larose, the lady of clarets, suffered less than most, losing in the five years not more than sixty per cent. Pichon Longueville, one of the most imposing, and Ducru Beaucaillon, one of the shyest but most insinuating of the group, suffered equally; and, at least in the case of the '79's, there is the unlucky afterthought that the vintage was for the most part bad as well as scanty—a vintage for Château bottling and cheap wine-merchants, not for the faithful drinker. Only it is fair to remember that such vintages, as in the case of 1871, sometimes turn up trumps in the most remarkable way when they have been despised for years. The tale of the third growths—wines not to be despised by any one—and of the fourth and fifth—which are not to be despised by anybody who is sensible—is very nearly the same. The curiously regular procession noticed in the case of Château Lafite, which made the produce of the three years 1875, 1878, and 1880 stand to each other nearly as three, two, one, is observed pretty steadily. Of the two most general favourites of the group—Château Lagrange and Château Langon—the first exhibits it almost exactly; while the latter, one of the pleasantest of clarets for those who are not wedded to "body," did not last year give more than a fourth of its 1875 yield. One of the few cheering things in the table is the recovery of at least one vineyard, that of Château Malescot St. Exupéry, from 60 *tonneaux* in 1879 to over a hundred in 1880. Château Giscours, a better wine still, also made a slight recovery. Of the fourth growths, Latour Carnet fell to a fifth of its 1875 yield; Branaire Duluc, a capital wine, to a fourth; Camarsac, also much to be commended, to a third; Beychevelle, justly placed by most people at the head of the class, to a third likewise. Of the fifth, Pontet Canet, which of late years has had much vogue, maintained itself, on the whole, better than any other wine in any class, giving last year a full half of what it gave five years ago. The before-mentioned poor relation of the Mouton family also held its ground fairly, and generally these wines seem to have suffered less than their betters. Yet Camarsac, a most delicate wine, fell from 45 to 12, Château Batailley from 170 to 63, and others in proportion. When these things are taken into consideration, when it is remembered that a hoghead of a first growth wine in a good year sells at least ten or twelve years before it can be drunk at some eighty pounds, and that bad wine will not keep at all, Sir Henry Thompson's dictum, that we ought to be very much obliged to the wine-merchants who will let us have good wine for our money becomes a most reasonable one.

It is impossible, however, when one looks at a table of this kind and hears the "gloomy porcupines" of science admitting that the phylloxera is too much for them, to avoid the questions, Will those of us who have thirty or forty years to live see claret a thing of the past, and, if so, what shall we drink? For observation with extensive view, surveying the atlas, really does not know where to pitch upon a substitute. All wines are good—that is, all good wines—and there are times when they seem to come as a welcome change; but somehow they are not suited to nineteenth-century man as claret is. It does not give one gout-like champagne, which moreover has by the operation of fashion ceased for the most part to have any taste of wine at all. If it be a moot point whether Château Latour or Romanée-Richebourg is the most perfect gift of Bacchus, it is still certain that the Gironde is safer and pleasanter, in Desdemona's words, "to live with" than the Côte d'Or. Besides, the enemy is attacking the East quite as fatally, and, indeed, more so than the West. Our fathers who were before us have settled it for us that we shall not drink port, not by drinking it all themselves, but by presenting us with constitutions with which port does not agree. Much the same may be said of Madeira, not to mention that the island is threatened with a second devastation. Sherry in its heroic forms—the old golds and the browns *Recoler Indes*—is equally impossible, and in its simpler varieties it is useful, but unpoetical. It is not of dry sherry, even in its second and admirable forms such as Tio Pepe and Amontillado, *Amigos*, that the famous commendation of "your excellent sherry" can be repeated. White wines, indeed, of all kinds, seem somehow to be things for occasional use only. From this immemorial in France itself white wine has been a thing, supposed to be drunk chiefly when the drinker is ill, and it may be acknowledged that Château Courbet or Montrachet, or White Burgundy—not to mention the champagnes which are permitted to state of wine—are not unpleasant medicines. But the stoutest and most fondly turns to the liquid which grows, indeed, in France, but

which England—save for a lacuna in the eighteenth century, when we suffered deplorably in taste and creative power in consequence—has always drunk, and for which we doubtless acquired the taste once for all in the days of our hold on Gascony. It is the "measure most uncommon" of the wine-list, a thoroughly respectable wine. You can have it to suit all purses, and if you will take the trouble to select it, in default of Sixty-four Mouton—it may be as well to mention that claret is no good after twenty years, and that the Fifty-eights which fetch absurd prices are really obsolete; a three-year-old ordinaire—which is not this wine or sour wine blanc, dyed with fuchsine or unripe Lavradio imported from Lisbon—will quench the thirst in a manner wholly satisfactory and even, in its modest way, gratify the palate. Nor does it require that extraordinary trouble should be taken with it, though it is needless to say that people who put their wine with its back to the kitchen fire cannot expect it not to show some slight signs of temper. In dealing with claret you need not "sit up with a thermometer," a variety of insomnia which may be recommended to Mr. Postlethwaite, and which was once described to us as the nightly practice of an enthusiastic and most meritorious importer of the capricious wines of the Côte d'Or. It will go with almost anything, fish, flesh, or fowl, though not—let it be observed with some sternness—with sweet rubbish or with tobacco. Of the results of its intimate and prolonged companionship, one is afraid to speak in these degenerate days. But, as one whose name is still revered in England has it, "In the drinking of good Bordeaux wine there is a point—I do not say a pint—at which men arrive, when all the generous faculties of the soul are awakened and in full vigour, when the wit brightens and breaks out in sudden flashes, when the intellects are keenest, when the kindest affections come out and shake hands with mankind." There is no need to continue the quotation, for everybody ought to know it; and if any reader does not, let him take down his *Virginius*, turn to Chapter xxxi., and find it. To this beatific state the messengers from the Peninsula between the Garonne and the Atlantic have the pass-key, and if anybody misuses it and forces them to let him into quite another state, that is not their fault. But it would be sad for humanity if fete and the phylloxera combined to punish its sins by taking the pass-key away altogether. The whereabouts of the Pais de Lanternois is painfully obscure, and the oracles of its priestesses were none of the most intelligible. But if the very palpable and intelligible representatives of the *Dive Bouteille* which come to us from Bordeaux were to cease, there would be nothing for it but a fresh quest for instruction before resigning ourselves to Zoedone or Australian wine. It is true that things have not come absolutely to the worst in Médoc; but that they have gone so far must be held to be what another poet of our own, who also held right views as to the proper use and purposes of wine and water respectively, would assuredly have described as "one of the innumerable proofs of the temporary supremacy of the Devil."

FIRES.

LESS than two years ago Lord Granville called attention in the House of Lords to the small means of protection against fire which London possesses as compared with other great cities. The noble Lord, whose zeal was stimulated by the fact that his own house had recently been on fire, obtained his information from a Report of a Parliamentary Committee, in which it was stated that, while Paris with a population under 2,000,000 had 1,548 firemen, and New York and Brooklyn, with a population of 1,350,000, no less than 2,300 firemen, London, with a population of 3,500,000, has only a minute force of 406 men. The weakness in point of numbers of the Fire Brigade was, however, far from being the only deficiency, as the Committee stated the system of defence against fire was in several respects bad. The Fire Brigade was dependent on the turncocks, who were the servants of Water Companies, and not under the orders of the Metropolitan Board. The Companies were under no obligation to give water, and that very important body the Salvage Corps was entirely independent. The natural result of a numerically weak staff and of defective organization was shown, by the Committee to have followed. In London there was three times the proportional loss of life and property that there was in Manchester, where the arrangements for defence against fire had been carefully considered and systematic arrangements made.

It is to be feared that things have not improved much since the time when the Committee made this statement. It appears from the Report of the Chief Officer of the Metropolitan Fire Brigade that last year there were 1,871 fires in London, of which 162 resulted in serious, and 1,709 in slight, damage. In 1877 there were 159 cases of serious, and 1,374 cases of slight, damage. Of the loss of life no comparative table is given, but it is satisfactory to learn that in 1880 only 33 deaths were caused by fire in the metropolitan area. When the population of London is considered, this must certainly be accounted a very small number, painful though it be to find that thirty-three people died so horrible a death. With regard to the loss of property, it is clear that fire does as much damage as ever, and it is little likely that its ravages will be checked while the principal evils pointed out by the Committee remain. There is too much reason to fear

that they are not likely to be diminished for some time. Londoners know to their cost what powerful corporations the Water Companies are; and, in spite of the constant talk of taking away the monopoly, it seems not improbable that the old adage about threatened men will be found to hold good with regard to threatened institutions. The Fire Brigade, though slightly increased, still remains miserably weak in numbers for so vast a city as London; and no such substantial increase as should be made is apparently contemplated. Those who govern the metropolis are willing that it should remain without adequate means of protection against fire, and it seems little likely that anything but a great calamity will rouse them from their apathy. It is, however, only fair to say that all that individual zeal and skill can do is done to make the most of such means of defence as exist, and that, with the very small means at his disposal, Captain Eyre Shaw does wonders in combating the enemy of great cities. How small those means are is best shown by giving his own statement of them in his Report. He says:—"The strength of the Brigade at present is as follows:—52 land fire engine stations; 5 movable land stations; 117 fire escape stations; 4 floating stations; 3 large land steam fire engines; 35 small land steam fire engines; 73 six-inch manual fire engines; 37 under six-inch manual fire engines; 135 fire escapes and long scaling ladders; 3 floating steam fire engines; 1 steam tug; 3 barges; 17 horse carts; 15 vans; 2 trollies; 58 telegraph lines; 170 miles of telegraph lines; 6 fire alarm circuits, with 40 call points; 485 firemen, including chief officer, superintendents, and all ranks." It seems almost incredible that 52 stations, 148 engines, and a total force of 485 men should be considered sufficient for London; but happily it is nearly as surprising to find how much this small body of men are, under their admirable chief, able to achieve. Although the amount of serious damage done in London is greater than it should be in a civilized city, it must be considered small when the numerical weakness of the Fire Brigade is taken into consideration. Since 1870 the proportion of serious to slight injury has never been above eleven per cent., and in 1879 and 1880 it was only nine per cent. As need hardly be said, a fire brigade cannot prevent fires. Its work consists in preventing small fires from becoming great ones, and this work Captain Shaw and his little band do in a marvellous manner. It is unpleasant to reflect on the small means of defence against fire which London possesses; but it is not a little gratifying to see what courageous men, commanded by a thoroughly competent officer, have been able to achieve. It may be assumed for certain that, out of 1,871 fires, a large proportion would have resulted in considerable destruction if it had not been for the exertion of the firemen, who must have prevented a huge loss of property, and who were also able to save many lives. They rescued last year 127 persons from a horrible death, and of the 33 unfortunate people who perished, 14 were taken alive from the burning buildings. That the service thus bravely rendered was not without danger may well be imagined. Captain Shaw says:—

Our list of wounds and other injuries for 1880 is unfortunately very large, but, considering the energy and fearlessness which the men display in the execution of their duties, the number of mishaps is not surprising; and, so long as this spirit continues to animate them, the many and various casualties which the nature of their work obliges them to incur are not likely to diminish. The risks to which the officers and men of the Metropolitan Fire Brigade are liable are undoubtedly greater and of more frequent occurrence than those of any other public body.

There have been during the year 333 cases of ordinary illness and 78 injuries, making a total of 411 cases, of which many were very serious and three resulted in death.

It does not appear whether these deaths were the result of ordinary illness or of injuries from fire, but in any case it is clear that the work of the firemen was dangerous in the extreme, and that the greatest courage was shown; and it is not pleasant to reflect that this intrepidity has not received any due recognition. The world, or at least the English world, knows nothing of its bravest men, and apparently does not want to know anything about them. The heroism of the Lamsgate lifeboat crew has of late attracted attention, but as a rule the splendid services of the crews receive little notice, while those of the firemen—who, by the way, are, for the most part, sailors—receive none at all; and yet some of these men must show a heroism which, if displayed on the battle-field, would gain the Victoria Cross. To prove this, it is only necessary to give Captain Shaw's list of the firemen commanded for special service during the past year:—

DATE.	NO.	RANK.	NAME.	NO. OF LIVES SAVED.
1880.				
April 17	72	First-Class Fireman	Philip Reuby and William Metcalf	8
"	277	Fourth " "	Isaac Gooch	
April 21	192	Third " "	William G. Jouning	3
May 24	337	Fourth " "	William T. Emanuel	5
Sept. 6	308	Fourth " "	John M. Scott	4
October 26	394	Fourth " "	William Wright	4
Nov. 23	377	Fourth " "		3

It may be assumed without any great presumption that the names of Mr. Philip Reuby, Mr. William Metcalf, and Mr. William G. Jouning are unknown to the mass of the world, and yet these men have achieved what should give celebrity for a lifetime, and they should certainly have received some public reward. As it is, the two firemen who at a fire rescued eight people from a

hilloons death, and the man who, single-handed, rescued five, have probably received some commendation from their superiors and some small extra pay, and with this their guerdon has ended. Undoubtedly, as a rule, men should not be made heroes of for doing their duty; but achievements which indicate exceptional valour should be rewarded by some kind of public recognition. It is impossible to suppose that all these lives were saved without very great risk, and it is painful to think that what these brave men did has been ignored by the public, and has received no further notice than is shown by a brief record in an official report.

The zeal of the firemen, of which such splendid proofs have been given, is, no doubt, in part due to the fact of their having an able commander, who is himself full of zeal, and does all he can to render the service as efficient as possible. As is well known, Captain Shaw has spared no pains to improve the system of defence against fire. He has constantly striven to make it more efficient, and last year only he succeeded in introducing an important innovation. He has established, he says, "6 circuits of fire-alarms with forty call-points, which very considerably reduce the distance to be run by persons giving alarms of fire, and consequently the time of our getting information." This mode of communication has already worked well; but, unfortunately, it may have to be abandoned in consequence of the mischief done by vicious idiots who think it a joke to give a false alarm. Thirty-three false calls have been made, with the necessary result of greatly harassing the firemen and of casting doubt on the value of all messages received from the street call-points. If these ingenious pleasantries are continued, the system of street-calls will have to be abandoned; but Captain Shaw is not without hope that the practice may be checked. He says, with justifiable exultation, that in the one case in which a man has been detected in tampering with a fire-alarm the magistrate sentenced the offender to fourteen days' hard labour, without the option of a fine, and that this has had a most beneficial effect. We venture to think that the offence should be visited with a different kind of punishment, which we believe would have a yet more beneficial effect. Those who behave like very silly and very mischievous schoolboys should be punished as silly and mischievous schoolboys are. The instrument which Sir William Harcourt admires so much should be called into operation, and they should be well flogged. A few sound castigations would put an end to pranks the inevitable result of which must be to destroy an existing safeguard against the dangers of fire, and consequently to increase the chance of people being burnt alive.

At what time there is most risk of being burnt, or of losing all household goods by fire, is a question which must interest all, and to it Captain Shaw gives an answer. In the concluding paragraph of his Report he shows the months, days, and hours at which fires were most frequent during the past year. Strange to say, the greatest number was not, as might have been expected, during the frost, when houses had to be warmed throughout, but in what used to be humorously called the merry month of May. The smallest number of fires was in February. Saturday, it seems, was the most unlucky day, and Tuesday the most safe. The twentieth week in the year was the most disastrous and the twenty-fourth the least. Taking fires by hours, the smallest number has been between seven and eight in the morning, and the largest between nine and ten in the evening. It is this last fact which is the most important. Captain Shaw says that "the figures for the weeks, months, days, for the last twenty years, although not varying materially, have at certain periods undergone considerable fluctuations, but those for hours are quite constant, the largest number being between nine and ten o'clock at night, and the smallest between seven and eight." Why the last-named hour should be the safest is not easy to understand, but it is not difficult to see why the other is the worst. Taking into account the habits of all classes, the hour between nine and ten is probably that at which the greatest number of fires without any one to attend to them are burning in London. From one of the tables given with the Report, it appears that more fires were due to "sparks from fire" than to any other cause. Curiously enough, therefore, Captain Shaw's figures exactly confirm the old opinion, now very commonly scouted, that an open fire with no one to attend to it is always more or less dangerous, and that when people go to bed they should be careful to hang on the fireguard. We doubt whether this precaution is now so generally taken as it was; but Captain Shaw's figures show it to be most necessary, and indeed it is more necessary in these days than it formerly was. Modern grates project more into the room than the old ones did, and there is in consequence far more chance of sparks flying on to the floor. Clearly, therefore, if people do not want to run the risk of being burnt, or of having their property destroyed, they should not neglect the old-fashioned precaution, and we trust that, owing to Captain Shaw's Report, it may be more generally observed, and that at some future time he may have to record that the number of evening fires in London has largely diminished.

THE THAW AND FLOODS.

THE inhabitants of cities and their suburbs have been suffering terribly from the plague of waters that has come upon them with the melting of the snows. We had been treated to many ingenious calculations, roughly made, we may presume, as to the

number of cubic yards of snow that had accumulated within the bounds of various municipalities; and we were warned that the hastily organised brigades of labourers set to work at shovelling out of charity, could make comparatively slight impressions on those masses. Judging by the spectacles that presented themselves in the wonderfully sudden dissolution in the warmth of the thaw, we should say that the most liberal of the calculations must have been well within the mark. Nature has been charging herself with the lion's share in the work of removal, and lending her assistance almost too vigorously. Drains were choked and cellars flooded; streets on declines were turned into rushing streams, while the backwater stood inches deep on the levels in a substratum of muddy slush. In many places rivers dammed back by the drifting floes of floating ice have overflowed their banks and spread wider desolation. The water in low-lying quarters of the towns mounted into the rooms of the lower stories, forcing the doors, breaking the windows, and giving the families of unfortunate tenants peremptory notice to quit. Minor miseries there were in abundance. With pavements left thickly covered with a mixture of mud and slush; with crossings turned into such hopeless sloughs of despond as paralysed the efforts of the most energetic sweepers, and an atmosphere overcharged with unwholesome moisture, the weak points in frail constitutions and poverty-stricken wardrobes were searched out, and indifferently shod pedestrians went about in saturated stockings. Colds were epidemic; there were choruses of coughing in public places of assembly, that drowned the notes of singers on the stage and damped the eloquence of divines in the pulpit. It was not only the poorer classes who suffered. Well-to-do valetudinarians, and the people who have really flaws in their physiques, had to choose between keeping themselves close prisoners at home or trusting themselves to the doubtful chances of cabs with damp cushions and ill-fitting glasses. Diners-out determined to keep their engagements, and daring visitors to the theatre were surprised to find the leading West-End thoroughfares in almost total darkness, thanks to the sudden extinction of the gas; while their coachmen had to thread their way between the snowheaps, through thickening fog and under a moonless sky, where collisions would be the penalty of careless driving. But it is an ill wind, as we know, that blows good to nobody. There were people, on the other hand, who had cause to congratulate themselves on the multitude of domestic mishaps and grave individual inconveniences. Of course the thoroughgoing thaw gave a fresh impulse to the employment of able-bodied labourers out of work, who must otherwise have been thrown back upon poor relief, and kept with their families in a state of semi-starvation. The chemists must have done an excellent stroke of business; and the receipts of many of the popular doctors can only have been limited by the difficulty of getting about with considerable deductions for horse-hire. For, besides the cases of the immediate victims to throat and chest complaints, there was universal panic among invalids and aged people, and by no means without reason. In spite of the skill and attention of the faculty, there was an extraordinary rise in the rate of mortality; while the lengthening columns of advertisements of deaths in the papers showed that all classes of society must have been suffering in common. But undoubtedly, in the whole range of professions and trades, no body of men did better than the plumbers. In the general bursting of pipes they became everywhere absolute masters of the situation, picking and choosing in a crush of customers. And all the time, as the water came soaking through ceilings and staining wall-paper, it was running up heavy future bills with house decorators and upholsterers which will have to be met sooner or later.

It is true that these troubles are lamentable enough; but with time, patience, and an unwelcome expenditure of money, people may hope to pull through most of them. As for the poor families who have been swamped, and who have seen their little property wrecked or damaged, it is to be hoped that they will be helped by the public benevolence; and, though many deaths may be laid to the door of the weather, it is probable that in most cases where it can clearly be brought in guilty, it has only precipitated the imminent and inevitable. In times of extraordinary floods like the present, it is certain of the residents in country districts who are most to be pitied. For the risks they run, both personal and pecuniary, are more serious than any that ordinary townfolk have to face, although we must add that in many cases they run the risks with their eyes open. It would be startling, were it possible to obtain trustworthy statistics, to find how many houses and cottages in our islands have been built in situations that are notoriously dangerous. Actual loss of life is happily not very frequent, since in the places where the danger is likely to be the greatest, and to come most suddenly, some means of escape are usually provided. A boat is secured to the bank of the river that threatens the isolated farmhouse with its rising waters; or a punt is moored somewhere in the bed of rushes that have been crushed down under the load of snow in the dreary marshland. But the periodical destruction of valuable property is a matter that is confined to the chapter of accidents; though an actuary spreading the risks over a number of years might make a fair approximation to what would be prohibitory rates of insurance. Or rather, perhaps we ought to say, that an actuary might have done so formerly. For of late years the chances in favour of flooding have been steadily increasing in the dangerous districts; and it is that circumstance, indeed, which is the best excuse for so many habitations left

standing on sites that are apparently the most obviously unsuitable. It is our improved drainage that has been aggravating the mischief. In the old days of rough-and-ready farming there was hardly any such thing anywhere as deep subsoil draining. When the floods fell or the snows melted they filtered away very gradually. Now, with a perfect network of scientifically adjusted pipes, thrust everywhere under land that will yield a return on the investment, things have changed most materially. With a rapid rise in the temperature after a heavy snowfall, each separate drain, as you put your ear to the ground, may be heard murmuring like a small subterranean water-course. The drains fill to overflowing the ditches that communicate with the rivulets. The brooks change the small streams into torrents, and the rivers, again, that are fed from those smaller streams, where there is any considerable fall in their valley-beds, come down in swift and impetuous flood; "roaring," as the Scotch say, "between bank and brae." The tenants of the farms or cottages standing low on the banks, or beneath their level, ought to be fully alive to the danger. Yet they live on there, the passive creatures of habit, as their fathers or predecessors lived before them. For there are few sensational traditions of catastrophes in the olden time; and perhaps the worst that the old men about the place have to tell of is of being reduced to wading in place of walking. So the occupants have never cared to shift their quarters, or even to take additional precautions in the way of throwing up new bulwarks against the flood or giving additional height and solidity to such embankments as there are. Not that they have not in their own time had repeated warnings, which one might have imagined they would have laid to heart, seeing that they show, when it comes to driving a bargain, that they are well acquainted with the value of shillings. But, like the fishes in the holes under the roots of the willows and alders, they seem to have got used to being washed out from time to time. Repeatedly they have seen their wheat-ricks and hay-stacks go floating down the bosom of the turbid stream, with pigs, poultry, and perhaps a cow or two, in company. They have seen their lighter furniture bobbing about in the kitchen on a ground-swell that made wild work with the crockery; and possibly they may have escaped themselves from the upper windows in the lightest of costume, when their safety depended on the ladder and the boat that fortunately proved to be promptly available. Nevertheless when the floods have subsided, they have settled back with the acquiescence of stolid resignation, as if they had been the victims of circumstances beyond their control. In saying so much, we are by no means speaking at random, or drawing an over-coloured fancy picture. Cases of the kind have come under our personal knowledge; and we have remarked moreover that these people appear to be the more doggedly determined to tempt their luck once more when it has played them an especially ugly turn. Experience ought to have assured them that, sooner or later, they must in all human probability suffer again. But, even if they were content to put up with the periodical losses which swallow the profits of many a prosperous year, they might consider that it may be a question of life as well as property, and that the pitcher may be carried to the wall once too often. An old house has in all likelihood been substantially built; but it was never intended to have its foundations sapped and shaken by these repeated floodings; even a slight examination would probably show rifts in the brickwork, and almost certainly some partial subsidence of the soil. One day the tenant may come to such grief as was predicated of the foolish man in the parable who had chosen to build his habitation on the sands. Short of the chance of such a signal calamity, having one's house upon a river below the flood range must necessarily involve serious contingent expenses; while the occupants must be of enviably phlegmatic temperaments if they are not disturbed by poignant anxieties in the beginning of such a thaw as that of last week. We are satisfied that the other day there were thousands of residents in lonely country places who were firmly persuaded that they might have to flee for their lives in the course of the next day or two. In not a few instances we learn that their apprehensions have been realized; though happily, in the great majority of instances, they appear to have escaped better than they deserved. Often, with tardy prudence, they had to set themselves to face the trouble and expense of moving their goods to a place of security. Yet we know well that, after being flooded out or scared for the time, they will return to their houses to go on as before, though they may have lasting reminders of the perils they have passed through in the shape of an aggravation of their chronic agues and rheumatic attacks. When such warnings are unheeded, though literally brought home to them, we suppose it is of little use to preach. We have always wondered at the indifference to danger that habit has bred with these Sicilian peasants, who live tranquilly in their villages on the slopes of Etna, though that formidable volcano has the disagreeable habit of throwing out new craters in fresh places at each successive eruption. Yet there can be no question that, on a calculation of the chances, the Englishmen who quietly await the floods of which the periodical advent is morally certain are in reality by far the more foolhardy of the two.

THE STATE AND THE FREE CHURCHES.

IT has become much the fashion of late, since the Liberation Society has been so busily engaged in preaching the gospel of disestablishment in season and out of season to all and sundry, whether they will hear or whether they will forbear, to speak of the Dissenting or Nonconformist communities as "the Free Churches." By this is meant, we believe, primarily that they are distinguished from the Established Church by their freedom from all legal trammels, though a further sense is attached to the phrase by many of their admirers to the effect that they are also free from the bondage of formularies and creeds. But the claim of Nonconformist bodies to the title on this latter score will appear on close inspection to be more than questionable. In the first place most of them have doctrinal tests or standards of their own of some kind, which are usually to the full as stringent as the Thirty-nine Articles or the Creeds. The Westminster Confession, for instance, which is binding on all Presbyterian ministers, established or unestablished, would prove to ordinary digestions at least as tough a morsel as the decrees of Trent. And even were it not so the numerous readers of Mrs. Oliphant's *Chronicles of Carlingford* will not need to be reminded that there is an irresponsible lay despotism, far more narrow and exacting in its theological requirements than any written code, to which all Dissenting ministers are expected to succumb. The great buttermilk of *Salem Chapel*, who almost deserves to take rank with Mrs. Poyser, is a typical portrait. But that is not all. The freedom of the Free Churches is not only limited by the dogmatic control of—if Mr. Matthew Arnold may be trusted—a not very intelligent laity; it is also by no means exempt, as is apt somewhat lustily to be assumed, from the control of the law. There is a real difference no doubt in the relations of the State to Established and non-established Churches, but the difference does not consist in the latter having no relations to the State at all. We have more than once had occasion to refer to this subject already, and have pointed out the curious illustration afforded by a century of American religious history of the practical working, or rather the practical unworkableness—*sic venia verbo*—of the theory of an entire separation of Church and State. It has received a fresh illustration of another and more direct sort in the decision reported last Wednesday, after seven days' argument in court, of the Ramsden Street, Ilkley, Chapel Case by Vice-Chancellor Hall. And it may be considered a somewhat crucial illustration, for the Congregationalist or independent community, of which the defendant, Mr. Stannard, is a minister, differs, if we are not mistaken, from the great majority of Dissenting bodies in having no doctrinal formularies binding on its ministers, as a whole, but leaving an exceptional latitude both of faith and worship to its separate congregations, whence indeed it derives the name by which it is commonly known. But the only result of this general laxity appears to be a particular stringency in the management of each separate chapel. The Congregationalists, as a body, having no doctrinal standard, each Chapel or congregation finds it necessary to make one for itself, in the shape of a trust-deed restricting the doctrines to be preached in its pulpit to those specified in a schedule duly annexed. How close a similarity, in form or substance, may prevail among these various trust-deeds we are not able to say; but if the schedule of doctrines annexed to that of the Ramsden Street Chapel, dated March 27, 1849, may be taken as a fair average specimen, they cannot be said to err on the side of excessive elasticity or reserve. The Evangelical Alliance has, if our memory serves us, nine articles in its confession of faith. The document Mr. Stannard was called on to subscribe has ten, which oddly enough contain not a word about the Incarnation, regarded by most Christians as a fundamental tenet of their belief, but is very explicit on certain minor points about which Christians have fiercely disputed, or have consented to disagree, from the days of St. Augustine to our own. This remarkable formulary runs as follows—

1. The Divine inspiration of the Holy Scriptures and their sole authority and entire sufficiency as the rule of faith and practice.
2. The Unity of God with the proper Deity of the Father of the Word and the Holy Spirit.
3. The universal and total depravity of man and his exposure to the anger of God on account of his sins.
4. The sufficiency of the atonement which was made for sin by our Lord Jesus Christ, and His ability and willingness to save all who come to Him for salvation.
5. Free justification by faith, and by faith alone, in the Lord Jesus Christ.
6. The necessity of the Holy Spirit's influence in the work of regeneration and also in the work of sanctification.
7. The predestination according to God's gracious purpose of a multitude which no man can number unto eternal salvation by Jesus Christ.
8. The immutable obligation of the moral law as the rule of human conduct.
9. The resurrection of the dead, both just and unjust.
10. The eternal happiness of the righteous, and the everlasting punishment of the wicked.

The particular details of Mr. Stannard's quarrel with the majority of the trustees of his Chapel need not detain us long. There was it seems a Broad Church and a Low Church, or as it called itself orthodox party in the congregation, eleven of the trustees, who were the plaintiffs in the recent suit, belonging to the latter, and ten, who sided with Mr. Stannard, to the former party. When in 1875 Mr. Stannard on his appointment as "co-pastor" of the Chapel was called upon to sign the schedule of doctrines he wrote a letter making certain reserves as to three of the articles in which he virtually repudiated the Calvinist view of original sin and predestination and the doctrines of eternal punishment. His statement was accepted by the trustees at the time as a sufficient compliance with the requirements of the trust

THE THREATENED STRUGGLE FOR GOLD.

IN writing lately of the probable value of money during the current year we referred to the apprehended scarcity of gold, and since then fears have begun to be entertained by men of business that before long the principal commercial nations will be engaged in a struggle for gold. So soon after the great gold discoveries a fear of this kind seems strange; but when it is recalled to mind how immense during the last thirty years has been the growth in population, wealth, and in the activity of trade, it will be seen to be not quite so strange as at first sight it appears. The first cause of the scarcity of the metal was the adoption by Germany of the single gold standard at the close of the Franco-German war. Since then that country has coined about 84 millions sterling of gold, and no sooner had her purchases ceased than the United States began to prepare for the resumption of specie payments. During the past four years the United States have retained the whole production of their own mines, and, besides, have imported very large sums from Europe. According to the official Mint statements it appears that at the end of December last the gold coin circulating in the United States, the gold imported from Europe during the last six months of the year, and the gold bullion fresh from the mines received at the Mint, amounted altogether to very nearly 100 millions sterling. A portion of this large sum had, no doubt, all along been held in the country, for it is to be borne in mind that in California and the neighbouring territories gold never went out of circulation; and, even where the inconvertible paper currency was alone used as money, gold doubtless was very largely hoarded. Still, if we allow 20 or 30 millions sterling on this account—which seems a very liberal allowance—we find that at least 150 millions sterling have been taken by the United States and Germany within the last few years. And now it is said that Italy, which is preparing to resume specie payments, intends to adopt a gold instead of a silver currency. The Bill laid before the Chambers has not yet become law, and the question, therefore, is not finally decided. Besides, when the Italian Government comes to negotiate the great loan which it must bring out to carry through the measure, it may find it impossible to get the gold which it requires. But, however that may be, the intention at present apparently is to resume in gold, and, if this should be done, the new demand will certainly press very heavily upon the gold reserves of the world. So far we have been dealing only with the new demands which have come into existence since 1870; but it is to be borne in mind that the wear and tear of coinage in all old gold-using countries requires a very large annual supply, and that, moreover, the steady increase both in wealth and population in those countries every year necessitates an addition to the circulation. For all these reasons it is certainly not improbable that we may have a very great scarcity of gold before long, leading to a determined struggle between the chief banks of the more advanced nations to preserve their own reserves.

While the demand for the metal has thus been growing, the production has been steadily falling off. At present the production of the American mines is somewhat under 7 millions sterling, while that of all the Australian mines does not exceed 8½ millions. Victoria, which was by far the richest of the colonies in the ore, now yields but about 3½ millions, instead of 12 millions formerly yielded. Some of the other colonies, however, have become much more productive, and, in consequence, the aggregate yield may be set down at about 8½ millions; as we have just said, making, with the American production, about 15 millions sterling annually, or little more. The Russian mines yield probably another 3 millions sterling; but none of the produce finds its way further west than Germany, the whole being absorbed either by that Empire or in Russia itself. So far as the world generally is concerned, therefore, the whole production at present does not very much exceed 15 millions sterling; and, as we have seen, the United States for four years running have retained the whole produce of their own mines. For all the rest of the world, consequently, there remain only the 8½ millions yielded by Australia, and the small supplement given by other countries, such as Japan and South America. At the very outside, therefore, the gold-using countries outside the United States and Germany have to depend upon an annual production of about 10 millions, which is barely sufficient to make up for the wear and tear of existing currencies. If, then, Italy insists upon having a gold currency, a struggle for the metal seems inevitable.

It is to be observed, however, that the United States are probably now fully supplied with gold. The increase of the currency, including therein not only the coinage, but also the greenbacks and the bank-notes, during the past two years has been little short of 60 millions sterling. And, making all allowance necessary for the enormous growth of population and wealth, and the extraordinary prosperity of the country at present, it seems scarcely credible that a further increase is necessary. Next autumn, indeed, as in the two past autumns, there may again be an export of gold from France and England; but in the dead months of the summer there will no doubt be a reflux to Europe of a considerable amount of the metal. We do not anticipate, therefore, that the coinage of the United States will be very much more increased. We should rather look forward by and by to the recommencement of gold exports to Europe. It is also possible that, as we have remarked above, Italy may find gold too dear for

her, and may wisely decide to resume payment in silver, or, at least, to maintain the double standard already legally in existence. Still, it is not to be supposed that a great reduction in the American currency will take place, and as the United States at present have the command of the markets of the world, it will not be possible to get back much gold thence except at very high prices. No doubt gold, like any other commodity, can be obtained at a price; but the price may be a very heavy one. It is also possible that, should the struggle become severe, Germany may decide to adopt the double standard already legally existing in the countries of the Latin Union. It is known that the Imperial Bank of Germany holds a very large part of its metallic reserve in silver, and the Bank cannot afford to incur the loss which would be entailed upon it by the sale of that metal. But, of course, the Government would indemnify the Bank for aiding to carry out a great Imperial policy. The German Government, however, is not fond of expenditure incurred without a clear prospect of gain; and it is quite possible, as we have said, that it may decide to retain the silver in circulation. However, these are all matters of speculation upon which no sufficient information exists to enable us to come to a conclusion, and, in any case, it is quite clear that gold must become scarce if all the present gold-using countries decide upon retaining gold as their single standard, unless fresh gold mines are discovered. Indeed, if the Bank of France should determine to recover some of the gold which it has allowed the United States to take from it during the last two years, the struggle may become very severe; for the Bank of England will take the most vigorous measures to protect its own reserve; and, as we have just been observing, America is in a position at present not only to keep what gold it has, but to take more if it should desire it, and, therefore, will part with any that may be needed for Europe only at a high price.

If nothing should be done to re-monetize silver, and if no great reforms should be introduced having for result the economizing of coin, it is quite clear that gold must tend year by year to become more scarce, even if the struggle which is talked of should not actually take place. But a tendency in gold to become scarce means a tendency to become dear; or, in other words, a tendency to fall in the gold prices of all other commodities. A general fall of prices would be of decided advantage to all persons having fixed incomes, but to the producing classes it would be decidedly disadvantageous. Persons with fixed incomes would find that those incomes would really be able to purchase a larger quantity of other things than they do at present, and would therefore in effect, though not in name, find their incomes very considerably increased. The producing classes, on the contrary, would receive less sums for the commodities they produced, and would, therefore, be worse off than they are now. The tendency of a scarcity in gold would thus on the one hand be to discourage production, to act as a kind of damper upon trade, and on the other to increase the well-being of all persons with fixed incomes. In trade, as in everything else, imagination plays a very great part, and people receiving lower prices for their goods would consider themselves poorer, would fancy that their business was less profitable than it used to be, and would have, therefore, less heart to engage in new ventures, and less hope to speculate. The tendency clearly, therefore, would be the very reverse of that of the great gold discoveries of thirty years ago, supposing that the scarcity were to last for a considerable length of time. As regards the immediate effect of a gold scarcity, Mr. Giffen, in the remarkably able paper which he has just contributed to the *Statist*, as a review of the past year's trade, suggests that it would probably be beneficial just now when we have entered upon one of those great commercial cycles in which trade goes on steadily improving and prices rising until they end in what is called inflation. The natural course of such a movement is to lead up to a great monetary crisis. Wages and prices rise, until the circulation of all the more advanced countries expands to such an extent that the banks find their reserves insufficient for the obligations they have incurred. In consequence, money becomes exorbitantly dear, and some accident occurring to create general uneasiness or alarm, a panic ensues and ends in disaster. Mr. Giffen suggests that, if a struggle for gold amongst the principal countries should now begin, money would become prematurely dear, speculation would be checked before it had reached its extreme limit, the banks would take measures to protect themselves before serious danger was incurred, and thus disaster would be averted, a crisis being substituted for a panic. And the experience of the period 1870-73 lends support to this theory. It will be recollected that the reform of the German coinage was going on during these years, and that in 1872 and 1873 Germany took immense amounts of gold from the market. The consequence was that money became dear sooner than it would have done in the natural course of trade improvement, and that the inflation period was cut short. In 1873, therefore, though there was panic in Vienna and in New York, there was no panic in London. We had a series of crises, and a long period of trade depression; but we had no real disaster. If this experience should be repeated now, the gold struggle with which we are threatened would not be so mischievous as many people are inclined to think, but would indeed be rather beneficial.

MR BOOTH'S OTHELLO.

MR. BOOTH'S Othello is, to our thinking, a greater, if a less complete, performance than his admirable rendering of Iago. That it should be in some sense less complete is not surprising. It was only to be expected from Mr. Booth's previous performances that he should be "totus teres atque rotundus" in his own conception of Iago, and we have already expressed our general agreement with that conception. On the other hand, while the American player had given evidence of possessing a poetical imagination and a fine insight, the bursts of passion displayed in his former representations had been more or less isolated, and there was nothing to show conclusively that he was equal to the terrible strain put upon an actor of Othello from the time when Iago's poison begins to work to the end of the play. In our judgment Mr. Booth has proved himself equal to meeting this strain. Here and there, as may be guessed from what we have said, his power of expression flags; his voice loses the ring with which he has begun a passage, and assumes a certain deadness as the speech comes to an end; and, on some few occasions, the method which marred some of his effects in Hamlet makes itself disappointingly apparent. The accounts which we had heard and read of the performance had, however, prepared us for far more disappointments than these, and we came away with a feeling of agreeable surprise at having witnessed what struck us as a singularly fine and powerful rendering of one of the finest and most difficult of Shakspeare's parts.

Mr. Booth takes the poetical view of Othello, the view which has always seemed to us the true one. Unless the romantic nobleness of the character is insisted upon, it surely becomes difficult to find any acceptable explanation either of Desdemona's love for the Moor, or of the complete confidence placed in him by the Seignoury, who regard him, it may be noted, not only as a first-rate soldier, but also as a man fit above all others in their service to be entrusted with the dictatorial command of Cyprus at a time full of trouble and danger. That he was meant to be represented as such a man as this, not as a violent savage, can, we think, be shown without any pedantic driving of words into a toil or going about to recover the wind of detached passages. One instance alone speaks strongly enough for this view. Iago, who hates the Moor, and is not given to take the highest estimate of his friends and acquaintance, says in soliloquy that "the Moor—howbeit I endure him not,—is of a constant, loving, noble nature." The collocation of the three epithets in a speech delivered by Iago in communing with himself seems to point clearly enough to the fact that Othello was not, and could not be, the mere savage overlaid with a thin veneer of acquired civilization which he has been too often represented as being. Passage might be multiplied on passage to support this view, but we prefer to rest upon what seems to us the strongest and most convincing instance. We may here refer to an opinion expressed, with amusing dogmatism, by Hazlitt (who, of course, was not infallible, but with whose judgments one more often agrees than not), that "Othello was tall, but that is nothing; he was black, but that is nothing. But he was not fierce, and that is everything." Mr. Booth's Othello is neither black, nor, in Hazlitt's sense, fierce. He has thrilling bursts of passion, but it is the passion not of a demi-savage carried away by the inflamed temper of his blood, but of a noble nature led astray by the diabolical wiles that work upon its freedom and openness to believe that it has been wronged to the uttermost and must exact, not blind vengeance, but the uttermost penalty. This at least is the mood of the last act. The cries of "I'll tear her all to pieces," and "Blood, Iago, blood!" are of course the result of a momentary and overmastering passion, and are only remotely connected with the semi-judicial attitude of the killing of Desdemona. It was in the scene in which these cries occur that Mr. Booth might not unnaturally have been expected to fall somewhat short of his purpose; he played it with a piercing intensity of passion, of which the effect was increased by the many indications that the giving way to such passion was repugnant to the soul of the valiant Othello. There are two points at which players of Othello have more or less agreed in thinking some such indication necessary—the moment after the burst of rage with Iago, and the moment after Othello has asked him to set on his wife to observe. In the first-mentioned of these passages, Mr. Booth, giving unrestrained sway for an instant to the passion which devours the Moor, draws his dagger upon Iago, and in the very act of striking flings it away, and falls upon a kind of garden seat in the middle of the stage in a reaction of horror and shame in which he manages to lose nothing of the general's dignity. So it is also with the other passage. The shame is more acute because the thing done has been more shameful, but the greater agony of remorse which follows it marks the natural nobleness of a man who has been driven into a deed which is abhorrent to his contemplation the moment that he has done it, but which he still will do in pursuance of what seems to him the just discovery of a vile crime. It would be easy enough to dwell at greater length upon the finely imagined and forcibly given effects which Mr. Booth produces in this scene; but it is time to say something of his performance in the earlier part of the play.

We quoted just now a sentence of Hazlitt's in which he asserts that "Othello was tall." There is nothing in the text to prove that he was tall, and argumentative use might be made of the passage about "this little arm"; but, no doubt, Othello had an imposing presence, and Mr. Booth, who is not tall, gives to him

a stately air of repose and conscious command which is entirely in harmony with the spirit of "Keep up your bright swords"—a speech which he delivers with admirable dignity. We have on former occasions dwelt upon Mr. Booth's extraordinary command of graceful and varied gesture; and it is interesting to note how, while nothing of grace is lost, the whole nature of his gesture in Othello is different from that which he employs in Iago. In the one case one sees the mobile dexterity of the super-subtle Venetian; in the other, the decision and freedom of the great Moor who still thinks lovingly of his unhoused free condition. The dignity shown in the first scene is kept up in the great speech in the Sagittary until the end, and at the end comes one of the actor's worst mistakes. Mr. Booth here descends to the stagy trick of "making a point" out of "and I loved her that she did pity them," and deliberately sacrifices the meaning of the fine line, "This only is the witchcraft I have used," to the gallery applause bestowed upon what is a common and time-dishonoured device. In the Cyprus scene, as in that of the council chamber, we have nothing but admiration for Mr. Booth's expression of the deep and chivalrous tenderness which he evidently thinks, and which we think with him, was the essence of the Moor's love for Desdemona. In the interruption of the brawl and the subsequent rebuke to Cassio, the actor gave another proof that dignity and command are not necessarily associated with a big physique. In this and in other passages that "power of the eye" about which so much nonsense has at times been written is proved by Mr. Booth to have a definite existence. We have already referred to the most important points in the "temptation scene," and we need now only repeat that while, with some comparatively unimportant shortcomings, it is full of a thrilling passion, it is throughout consistent with Mr. Booth's idea, which we take to be the right one, that Othello was a noble creature, whose description of himself at the supreme moment of the play is accurate, "Not easily jealous, but being wrought, perplex'd" (not savage) "in the extreme." On the line suggested by these words Mr. Booth's last scene is played, and played with a concentration of passion and restraint—a restraint evidently not due to any want of power—which comes as a welcome surprise after the great effect produced by the preceding scenes. Here and there the performance is marred by the same inclination to long-drawn sobbing which was observed in Bertuccio, but we have no wish to dwell on the shortcomings of a performance which seems to us charged with truth, chivalry, and passion.

REVIEWS.

LIFE OF JOHN, LORD CAMPBELL.*

ALTHOUGH the autobiography, strictly so called, only extends over a portion of Lord Campbell's life, the narrative which has been compiled with remarkable skill and judgment by Mrs. Hardcastle is entirely of his own composition. It fortunately happened that his father and his brother, with both of whom he was on terms of affectionate confidence, lived at a distance from London. The Rev. Dr. Campbell, a clergyman of high character and of local reputation, was minister of Cupar in Fife. Lord Campbell's older brother, afterwards Sir George Campbell, spent his earlier years in the medical service of the East India Company, and after his retirement settled at Edenwood in the same county. The future Lord Campbell left Scotland to seek his fortune in 1797, at the age of eighteen; and his letters for many years contain a minute account of his daily life, of his projects, and of his hopes and fears. The published letters evidently form a small portion of the whole number which he must have written; but they are so arranged as to make an almost continuous story. Those addressed to his brother, though not fuller of detail are more unserved in the expression of anxieties and doubts, which he probably wished to keep from his father's knowledge. It has happened to but few men of eminence to admit the world at large to so complete a knowledge of their lives and characters. Still fewer could have borne the test so well, for every successful step in Lord Campbell's career was the result of his own merits and qualities, including the power and the habit of unremitting labour. The contrast between the obscure and narrow circumstances of his youth, and the uninterrupted prosperity which followed, is the more interesting because the change was the natural result of unfailing industry and self-denial, giving scope for the display of remarkable ability. It is true that he had considerable advantages in the circumstances of his early education. His father, who was more highly cultivated than ordinary Scotch ministers of the time, had wished his son John to become a member of his own profession; and from eleven to eighteen the boy, in conformity with national custom, was educated or allowed to educate himself at the University of St. Andrews. His love of reading enabled him to acquire a considerable, though desultory, knowledge of English literature; he learned to read Latin with ease and pleasure, though he lamented through life his ignorance

* *Life of John, Lord Campbell, Lord High Chancellor of Great Britain; consisting of a Selection from his Autobiography, Diary, and Letters.* Edited by his Daughter, the Honourable Mrs. Hardcastle. 2 vols. London: John Murray.

of quantity, and he knew enough of French to be able in later years to travel on the Continent with ease and advantage. To the Scotch ministry he had no distinct objection; but he eagerly welcomed the opportunity of going to London as tutor to a young man of fortune. Not long afterwards a debate in the House of Commons, in which Pitt, Fox, and Wilberforce took part, convinced him that it would be intolerable to devote himself, as he said, to the business of writing sermons and fattening pigs. By judicious abstinence from direct opposition, he gradually smoothed the disappointment to his father, who nevertheless hankered after the familiar ease and security of a benefice and a manse when his son had already begun to rise at the Bar. Soon after his arrival in London Campbell obtained occasional literary employment, and in two years, through the introduction of a fellow-student at St. Andrews, afterwards Serjeant Spankie, he was employed by Mr. Perry as a reporter for the *Morning Chronicle*, with a salary sufficient for his modest needs. He now resigned his place as tutor, and formed the design, from which he never deviated, of becoming a member of the English Bar. After a time he exchanged the unwelcome function of reporting for the higher position of a contributor, especially in the department of dramatic criticism and of a branch of composition which was denominated wit. He states, with apparent seriousness, though probably not without a sense of humour, that, to prevent misconception, he always caused the point of a joke to be printed in italics. Some grotesque stories which were told about his supposed dramatic blunders have not even the merit of being caricatures. The only misadventure which he records is the publication of a criticism of a performance for which, in his absence, another play had been substituted. His own knowledge of dramatic literature and of the history of the stage was highly respectable.

In 1800, two years after his arrival in London, Campbell entered himself as a student at Lincoln's Inn. Four years more elapsed before he became a pupil of Mr. Tidd, whose name still survives as the first special pleader of his time. Although the autobiography is strictly and properly confined to personal history, incidental mention of contemporary circumstances is always interesting. The engagement with Tidd was delayed by the preparations of Bonaparte for the invasion of England, and by the consequent necessity that Campbell should attend to his military duties as a member of the Bloomsbury and Inns of Court Volunteers. About the same time he records, for the information of his brother, a strange experiment which he had witnessed of a theatre brilliantly lighted by a kind of inflammable air passing along pipes to burners provided for the purpose. "The man pretends to extract gas from smoke, together with large quantities of other valuable products. He proposes to supersede the use both of coal fires and of candles, and to supply every house in London with gas, in the same manner as they are now supplied with water from the New River Company. I understand he is merely a copier of Le Bon, a French chemist, who abandoned the plan as impracticable and absurd." Notwithstanding Campbell's industry and frugality, he would not have been able to pay Tidd's fee of a hundred guineas but for the willing and liberal aid of his brother, who now possessed a competent income. George Campbell's bounty was received in as generous a spirit as that in which it was given, and the money could not have been better invested. At the end of his first year of pupillage Campbell was engaged by Tidd at a small salary to superintend his business for two years in the absence of the principal. It was by this opportunity of study and practice that he acquired the profound knowledge of law which was the foundation and support of his subsequent fortunes. The advantages which he enjoyed would have been comparatively wasted on a student who had not the special aptitude for law which is as peculiar and almost as rare as all the higher intellectual gifts; but it was fortunate for him that he was able to master the minutest niceties of practice before he was exposed to the competition of the Bar. He had found it necessary to discontinue his connexion with the *Morning Chronicle* in accordance with a rule of etiquette which then prevented barristers from contributing to newspapers. The consequence was that, but for the liberality of his brother, he might have been compelled to pause at the threshold of his enterprize.

Campbell was called to the Bar in the November term of 1808, and he joined the Home Circuit as the least expensive; but, after three years, finding that there was no immediate prospect of an opening, he migrated to the Oxford Circuit, where he soon rose into practice both at the Assizes and at Gloucester Sessions. He earned a small sum by writing anonymously a part of Watson's book on Partnership, and in 1807 he began his celebrated Reports of Lord Ellenborough's *Nisi Prius* judgments. "There certainly," he says, "never was such a judge for a *Nisi Prius* reporter. He was not only laborious and indefatigable, but he was acute, rapid, bold, decisive, ratiocinative, and eloquent." He adds that Lord Ellenborough ought to have been grateful to his reporter for suppressing many wrong decisions. He had, according to his own account, a drawerfull of bad Ellenborough law, which was afterwards destroyed in the fire at the Temple. The Chief Justice was habitually rude to the rising counsel, who more than reciprocated his dislike. The incessant wrangling which ensued was the principal drawback to the pleasure of early and progressive prosperity. After five years' practice Campbell was making 1,000*l.* a year, an income which soon increased threefold. After that time he ceased to report to his correspondents the amount of his earnings. His practice was in his earlier career chiefly confined to commercial

business, and to the difficult legal questions which interest lawyers, and which escape the notice of ordinary readers of newspapers. He had consequently some difficulty in persuading his father that he had acquired an enviable position when he had the largest business of any counsel of his standing. The excellent minister was profoundly indignant with the *Cupar* bailies who had disloyally neglected to retain their rising townsman in support of a little private Bill which they had occasion to promote. It was in vain for Campbell to explain that the advantage of holding a brief in Committee would have been trivial, and that "he was otherwise fully employed. The families of prophets are more impatient than themselves of their ordinary failure to obtain honour in their own country. In after years the Scotch, including probably the inhabitants of *Cupar*, were abundantly ready to welcome back the Attorney-General or Chief Justice who had crossed the Border long before as a penniless youth. It is only while the prophet's inspiration has not yet been officially recognized that it is overlooked by local scepticism. Lord Campbell would perhaps have been less popular with his countrymen if they had read the many passages in his letters and diaries which express dislike and contempt for their prominent defects, and especially for their dialect. He would rather, he declares, dine at a house where there is bad wine than at a house where Scotch is talked. Even his warm affection scarcely overcomes the disappointment with which he finds that, after eighteen years spent in India, his brother has come back with the accent and pronunciation of *Kife*. His own speech indicated by a certain peculiarity of tone, which had probably once been artificial, the successful efforts by which he had taught himself to talk like an Englishman.

From the moment at which he first put his foot on the ladder Campbell never ceased to ascend. For the ascetic solitude to which circumstances had condemned him during his earlier years in London, he found ample compensation in his marriage with the daughter of Mr. Scarlett, afterwards Lord Abinger. Throughout life he was singularly fortunate in his family relations. His union with his wife, which lasted for nearly forty years, seems to have been uninterruptedly happy, and his devotion to his children was fully reciprocated as they successively grew up. As he gradually acquires a higher social and professional position he sometimes informs his Scotch correspondents with natural complacency, and with a laudable wish to give pleasure, of his dinners in company with peers and Ministers and Royal dukes; but he seems not to have sedulously cultivated the arts of society. His domestic attachments both in earlier and later life appear to have rendered him comparatively indifferent to other forms of intimacy, though he was of course familiarly acquainted with the leaders of the Bar and with his colleagues in offices and political associates. Some of them he mentions with respect, and many with sarcasm, but none with affection. With Lyndhurst and Brougham he maintained for the last thirty years of his life an incessant wrangle which was not incompatible with more or less friendly relations. To his father-in-law, whom he was anxious to treat with regard and deference, he was constantly opposed in professional conflicts, and afterwards in politics. It was not without hesitation that he chose his own party as he advanced into the first rank of the profession. After an earlier defeat he was returned in 1830 for the borough of Stafford, with an amount of bribery and treating which, as he candidly confesses, might have unseated the whole House of Commons. Although he had always inclined to Whig opinions, he wished well to the Administration of the Duke of Wellington, in which Sir James Scarlett was Attorney-General. His disposition was so uncertain that he was obliged to request the Ministerial Whips to discontinue the circulars which they had begun to send him. The Duke's rash declaration against reform determined him to adhere definitely to the Whig party, but he was alarmed and disappointed by the sweeping character of the Reform Bill. It is probable that more than half of the overwhelming majority which ultimately carried the Bill would, like himself, have greatly preferred a more moderate measure; but in political life it is necessary to choose, not among many courses of action, but between the measures of the hostile parties. Campbell soon became a zealous and earnest supporter of the Government, in which his professional rank and the services which he rendered to the Government in Parliament soon entitled him to take a place. When, in 1832, Sir Thomas Denman became Lord Chief Justice on the death of Lord Tenterden, there was a scheme for the removal of Horne, the Solicitor-General, to the Bench, and for the promotion of Campbell at one step to the post of Attorney-General. It was finally arranged that Horne should nominally succeed to Denman, with an understanding that the Solicitor-General should be in reality the principal law adviser to the Government. Sir John Campbell now exchanged the costly and disreputable borough of Stafford for the more respectable constituency of Dudley; but two years afterwards, on becoming Attorney-General, he found, like many another candidate or member, that comparative purity is often associated with political caprice. After remaining out of Parliament for a few months, he had the satisfaction of obtaining in the city of Edinburgh a seat which he retained till his advancement to the peerage. In 1836, on the death of Sir John Leach, the Great Seal, which had been for some time in commission, was given to Pepps, who became Lord Cottenham, and Brougham, with the title of Lord Langdale, was appointed Master of the Rolls. Sir John Campbell admitted the right of the Prime Minister to select a Chancellor; but he declared that the Attorney-General had an unquestionable right to the Rolls, and announced his determina-

tion to resign if his claim was not admitted. His scruples were overcome by a general promise of future promotion, and by an immediate grant of a peerage to his wife, who assumed the title of Baroness Stratheden. In one point of view the irregularity might be thought a compliment, as the Government was reluctant to lose the efficient services of the Attorney-General in his office and in the House of Commons; but it is well known that some of the Ministers were under the delusion that Lord Langdale would be a match for Lord Brougham and Lord Lyndhurst in the House of Lords. The Attorney-General watched not without complacency the total Parliamentary failure of both the rivals who had been preferred to himself. Many years afterwards he asked Brougham what Cottenham did with himself since his retirement from office. The answer was ready:—"He knits stockings and sells them at threepence a pair, which he can afford, as his time is of no value." The same reproach could not be addressed to Lord Campbell, who, in or out of office, was never idle. He retained the most laborious and most lucrative office in the Government till the eve of the change of Ministry in 1841. He was little inclined to resume the ordinary practice of the Bar, though he was certain to make a large income. On his consent to become Chancellor of Ireland without a right to a pension, Lord Plunket was summarily superseded in circumstances not creditable to the Government. The outgoing Chancellor seems not to have blamed his successor, as he only revenged himself by expressing a doubt whether during his passage of the Irish Channel in rough weather Lord Campbell would throw up the Seals. After sitting once or twice in Court, the new Chancellor was compelled to retire with his colleagues, who at that time had no early prospect of a return to office.

Lord Campbell, now at the age of sixty-three, projected and accomplished a remarkable enterprise. There can be few examples of a successful literary career begun at such an age, after a life of uninterrupted labour in other fields of activity. The conception of the *Lives of the Chancellors* was felicitous, and the execution was in a high degree successful. If the biographer was not uniformly accurate, he was always amusing, and his discussions of the many legal points which he had occasion to notice were sound and instructive. The severest critics could not dispute his claim to the character of a popular writer. His later enterprise of the *Lives of the Chief Justices* had the same merits and the same defects. The vigour of Lord Campbell's physical and mental constitution was still more remarkably illustrated when he became Chief Justice of England on the resignation of Lord Denman in 1850. He was now seventy-two years old; he had retired from practice nine years before, and he had no judicial experience except in the House of Lords and the Privy Council. The interval had been spent in the sinecure office of Chancellor of the Duchy, with a seat in the Cabinet. He felt some regret at this separation from his colleagues; but he entered on his new and arduous employment with cheerful energy. During nine years' tenure of the office he established the reputation of a great judge, which he still retains in the estimation of the Bar. Every competent member of the profession would place him far above his dignified and upright predecessor, and his brilliant and accomplished successor, who never affected to be a profound lawyer. Lord Campbell's advanced age seemed wholly exempt from infirmity; and to the last his authority was acknowledged both by his colleagues and by the Bar; but he had not yet accomplished his singular destiny. Lord Palmerston, on the formation of his Ministry in 1859, offered him the Great Seal, which he accepted. At the age of eighty he immediately began to study the Equity Reports, and to refresh the general knowledge which he possessed of Chancery practice. He held office for two years, not without credit, and then he died in harness. On the 19th of June, 1861, he sat in Court at Lincoln's Inn, and attended a meeting of the Cabinet, after which he walked home to Stratheden House and wrote a judgment. He had a party to dinner, including Sir David Dundas, to whom he remarked that there ought to be a petition in the Litany against lingering illness. Early the next morning he was found dead in his arm-chair, "honourably released," according to a saying of his own, "from the labours and anxieties of the Great Seal." It has been impossible in a limited space to notice the details which throw light on Lord Campbell's character. The biography will fully supply the omission by the vivid representation of the character and history of a strong, resolute, laborious, and essentially kindly man.

WARD'S ENGLISH POETS.*

(Second Notice.)

THE third and fourth volumes of Mr. Ward's selections from the English poets, completing the undertaking, are now before us. From Addison to Blake, and Wordsworth to Dobell, is a long journey, in the course of which the reader is taken along some of the duller flats ever traversed, and up some of the extreme heights ever scaled, by English verse. We begin with the conventional trimness of an age whose literary aim was to reduce life to an epigram, and which is already further from us in thought and sympathy than the times of Shakespeare, and even of

Chaucer. We end with work more distinctively modern in its tone, and more recent in its actual date, than much that has been done by masters whom we may still see in the flesh. The writings of living poets are excluded by the design of the collection; we are not sure that the spirit of the rule might not with advantage have been carried further. A less extended view of our poetical history, but a juster one as far as it went, would have been obtained by drawing a line at a certain time, and admitting only those writers whose *floruit* could fairly be dated before it. Almost exactly the space of a generation lies between us and the middle of the century, and that date might serve well enough. It might have been still better, as giving a fixed and effective rule to the same purpose, to stop before coming to writers born within the present century. We should have thought it not unfitting to see the roll of major poets closed for the present at Landor. The true moderns, such as Mrs. Browning, Clough, and Kingsley, belong to a generation which in great part is still with us. They breathed the same air with Mr. Tennyson and Mr. Browning, and others whose voices have not yet ceased. The student of literature (and for such, we conceive, this book is chiefly intended) who should consider their work without reference to the powers still present among us which influenced it would consider it much amiss. The presentment of our recent poetry determined by the accidents of human fate is likewise one-sided. Not only does it perforce ignore the best of the new strength which has arisen in the last fifty years, but it does a kind of injustice to one of the great founders or restorers of our poetry of the nineteenth century. The romantic, the speculative, and even the so-called spasmodic school have their champions here. But no evidence is put forth that the noble gravity and sober purity of Wordsworth's English have left their special mark in a tradition carried on by worthy hands. The happy circumstance that the names of Henry Taylor and Aubrey de Vere are yet for us as for our fathers the names of living men forbids its production. Mr. Ward has indeed done the best thing he could next to giving specimens of Sir Henry Taylor's own work. It is Sir Henry Taylor who here introduces to us Rogers, Southey, and Campbell; he tells us how in past days he sat himself at Southey's fireside, and copied verses fresh from his pen. There is something reverend and touching in these links between the generations of men, not the less deserving of pious memory for having slight matters for their occasion, and those are benefactors who put them on record. Sir Henry Taylor is a veteran critic, too, as well as a veteran poet; and his terse and restrained judgments compare not unfavourably with the ampler and more curious commentaries of our newer writers. How happily turned, for instance, is that one sentence in his introduction to Campbell where he speaks of the old heroic couplet "stumping along as if with two wooden legs." But we are following methodical guides, and must not desert their method. Let us start with them in due order from the reign of our sometime sovereign lady Queen Anne, when satire delayed not to pick and choose its weapons, and political difference was an ample justification for imputing to harmless and amiable persons every sort of public and private infamy.

A considerable part of Mr. Ward's eighteenth-century volume—we should think about half—is at this day, it must be confessed, but weary reading. The worst of dead levels in literature is a level of artificial mediocrity. So thoroughly and mercilessly was it occupied, explored, and laid out in every possible detail by the poetical engineering of the last century that, in looking over this volume, we feel the infliction as even now barely tolerable. The splendours of that day of which Blake was the morning star are for the moment effaced and out of mind. We are choked by the petty fluency of our so-called Augustan age, and pricked to death by its pitiless neatness. We walk in the valley of the shadow of shams, with people who call a cold bath a *gelid cistern*, or in their grief (and a sincere grief too) for a friend buried in Westminster Abbey *range the gloomy isles*, and console themselves with the thought that their occupation is a *sad luxury to vulgar minds unknown*. Tickell's elegy on Addison, a better specimen of the current workmanship of the time than most, shows us how the reign of frigid convention had its reward in the Nemesis of vulgarity, that extreme vulgarity which plumes itself on being above the vulgar. What is more, the narrowness and bad taste of that time have left their mark of permanent injury on the English language. We have lost, indeed, less than the French. We are not so forbidden to draw on the stores of the Elizabethan vocabulary as the modern Frenchman is forbidden to draw on those of Ronsard or Montaigne; we have escaped an Academy. But our Augustan writers did by their persistent misuse attach a certain flavour of the ludicrous, not only to several phrases and turns of speech in themselves innocent, but to one or two perfectly good and honest English words, such as *swain*. Who dares to speak of a swain now? Pope's "conscious swaine," in his gaudy travesty of Homer, sum up the worst characteristics of the school of which, for good and for ill, he stood at the head. Such an age of conscious and, after its lights, conscientious mannerism there never was before in English letters, and one trusts there never may be again; though we are not without apprehensions as to what the twentieth century may think of a great deal of the critical prose of these latter Victorian days.

Mr. Ward's fellow-workers gallantly do their best to find saving merits in the minor poets who apostrophized the muses and "Great Anne" or (as the case might be) "Great George" in alternate numbers. But their efforts, gallant as they are, seem to

* *The English Poets: Selections with critical Introductions, &c.* Edited by Thomas Humphrey Ward, M.A. Vol. III.—Addison to Blake. Vol. IV.—Wordsworth to Sydney Dobell. London: Macmillan & Co. 1880.

be against the grain. Armstrong, he of the "gelid cistern," is discovered by Mr. Saintsbury, ever fertile in resource, to possess a certain starched grace which is not unattractive. Beattie would have been a poet if he could, and what more could man do? And when he comes to Blair's *Grave* the same critic, among other topics of ingenious and modest commendation, takes up the solid and impregnable position that its shortness is very much in its favour. Of Christopher Smart we are bound to believe on Mr. Ward's authority that the "Song to David" is his masterpiece at any rate. And in truth it has elements of speed and fire, striving with a clumsy form, which hardly belong to the eighteenth century. But when we find David "remembering, when he watched the fleece, how sweetly Kidron purled," we cannot admit without qualification that the eighteenth century has nothing like it. As refreshment in the desert it is enough to be thankful for. We must not leave the minor poets without giving a word of acknowledgment to the delicate care which Mr. Gosse has bestowed on presenting several of them to the best advantage. Their ghosts, if there be any gratitude in ghosts, will scramble to shake hands with him in Elysium. Before we pass on to the greater names we will offer a conjectural, but, we think, fairly certain emendation of the last line of Prior's poem, written from the Hague, and entitled "The Secretary." It is printed, "So blessed as the Englishen Heer Secretar" is. Surely Prior wrote in one word *Secretaris*, the proper Dutch form.

The strength and the limits of Pope's mastery are set forth with impartial felicity by the Rector of Lincoln. But the contributions which will excite the keenest interest are those of Mr. Swinburne on Collins and Mr. Matthew Arnold on Gray. Collins is exalted to a height as yet hardly thought to belong to him by any of his readers; certainly not by Mr. Arnold, who, standing in Gray's place, seems to look on him as a kind of pale companion at . . . That Gray, as a lyric poet, "is simply unworthy to sit at the feet of Collins" will be a startling judgment to many. But, if we do not stay to question the measure of expression, we cannot easily take exception to it. In truth and directness, in clearness and serenity, in the "sofly austere and simply tender gravity," which, as Mr. Swinburne points out, is so curiously akin to the work of the French landscape-painters of our own time, Collins must be allowed to stand apart. Mr. Arnold's essay on Gray is one of those artlessly artful studies in which he takes up, as if by accident, the hint of a word or phrase which in its own place is run over with no second thought, and makes a burden for his discourse of it. We shall not reveal here the pass-word he has chosen this time. Of Chatterton we have a high estimate, but not too high, from Mr. Theodore Watts; of Blake, an account from Mr. Comyns Carr, which, good as it is in all essentials, yet somehow to our mind falls short by just a hair's breadth of what is Blake's due. For Blake's merit is not only that before Wordsworth he broke the spell of so-called Augustan conventions in poetry; he broke it greatly. To match him not only in freedom and simplicity, but in actual lyrical genius, we must go right back to the Elizabethans. The song beginning "My silks and fine array," if Blake had chosen to pass it off as a rediscovered piece of Shakespeare's early time, might well have deceived a more critical age.

In the fourth volume we have to do with the full strength of modern English poetry. First comes Wordsworth, introduced by the Dean of St. Paul's in an essay which, among other merits, carefully points out the relation of Wordsworth's actual work to his ethical view of life and his deliberate theory of what poetry ought to be. Coleridge is handled by Mr. Pater in a style which for him is restrained. Mr. J. A. Symonds shows with fine insight how Lord Byron's greatness has become a stumbling-block to many English readers of later times by the very qualities which have made his renown more than English:—

Byron's work is too primitive, too like the raw material of poetry in its crudity and inequality, to suit our Neo-Alexandrian taste. He wounds our sympathies; he violates our canon of correctness; he fails to satisfy our subtlest sense of art. . . . As a man, as a thinker, as an artist, he is out of harmony with us. Nevertheless, nothing can be more certain than Byron's commanding place in English literature. He is the only British poet of the nineteenth century who is also European.

Mr. F. W. Myers puts himself in the position of those who on common-sense principles cannot see how Shelley deserves to rank as a great poet, and expresses their objections with all the force of which they are capable, in order to exhibit by way of reply his own view, which is substantially the artistic and only truly sensible one. Mr. Matthew Arnold, with a certain earnestness and even severity of tone, vindicates for Keats, as against unfortunate appearances and injudicious praise, the higher and more enduring qualities of a true poet's character. Landor, a poet who wrote for scholars, and whose fate is to be esteemed rather than loved, save by a very few, is brought before us by Lord Houghton, himself a scholar and a poet. The Dean of Westminster's characteristic notes on Keble, whose poetry, in the Dean's view, bears unconscious witness against his theology even when it is most theological, form an appropriate sequel to what he has said of the Wesleys in the third volume. Of later names space forbids us to say anything; only in the selection from Clough we mark a strange omission. The "New Decalogue," one of his best known and most brilliant shorter pieces, is not there. Still more strangely Thackeray, who stands clearly first among our modern writers of humorous and half-serious verse—far above Præd, for example—is not represented at all.

HIRAM GREG.*

IN Mr. J. Crowther Hirst we have one more victim to the theory of three volumes and the circulating libraries. Many of the novels that come before us would be worthless, however much they were cut down. In their case, all that could be gained by abbreviation would be a saving of time to the reader. The time that he still gave to them would be utterly thrown away, but the waste would not be quite so great. It has been said that no use has ever yet been found for the snippings of leather. Some ingenious and enterprising man tried to turn to account the vast heaps that are formed in the shoe-shops of Northampton. But when he had found that they could not even be employed in the manufacture of black-currant jam, he gave up the attempt in despair. The heaps, we believe, remain as large and as worthless as ever. A barrowful is no better than a cart-load, and a handful is as bad as a barrowful. It has no essence which can be extracted by boiling down. Such are Mr. Biggar's speeches, and such is one class of three-volume novels. Both alike are the despair of all who have either to listen to them or to read them. But the case is very different with another class of speakers and writers. They have something worth telling, but they have not always art enough to separate it from matters which are too dull for anything but silence. Your orator, indeed, is free from one temptation to which the luckless novelist is exposed. No one is unwise enough to insist that he should take three hours to say what he could say equally well in one. His want of brevity is his want of art. Old-fashioned persons used, indeed, always to divide their sermons into three parts, but even from the pulpit that superstition has pretty well departed. But, though sermons are free, novels are still subject to a miserable bondage. Efforts are from time to time made to break through it, but they do not seem to succeed. We continually find stories published which, we are forced to believe, have undergone expansion in spite of the author's taste and judgment. Publishers, or the owners of circulating libraries—we know not with which of the two the blame lies—seem to look upon a story as a balloon. It must be puffed out to a certain bulk before it can hope to rise. A young author who has written his best is told, we can well believe, that his story has only one fault. It is a good volume and a half too short. Brevity may be the soul of wit, but it is not the soul of the novel that is to circulate. Should he look perplexed, and ask how he is to lengthen a story that is complete in itself, he is told that he must fall back on episodes. He can give the heroine a couple of lovers if she has only one already, or three if she is already provided with the almost orthodox number of two. After all, what is easier than to change the whole plot of a story, and yet to leave it very much the same? It was our good fortune once to fall in with the enterprising proprietor of a cheap but harmless magazine. He explained to us that he had always three stories running at the same time—one close on the point where the wicked hero met a violent end, and the good heroine is thinking of ordering her wedding-dress; another at that middle point when everything seems hopeless for the virtuous, and villainy is triumphant; and the third in the opening scenes, when everything is at present peaceful, but dark clouds may be discerned gathering on the horizon. He added that it was one of his principles that the heroes of the three stories that were running together should not belong to the same profession. He had no difficulty in enforcing this rule. He would merely return the manuscript to the author, and tell him that he quite approved of his tale, but that it was not the turn, say, for a curate hero. He must either, therefore, wait or change his curate into a gallant soldier, or, it might be, into an extravagant but warm-hearted young baronet. Authors, he said, very rarely found any difficulty in making the alteration, and in a week or so returned him the story quite ready for publication.

When we come across a novel of a new writer that has really considerable merits, and shows no small power of a certain kind, we cannot but greatly regret that either the mischievous fashion of the libraries, or the bad examples set him by his brother authors, should have led him so far astray. In *Hiram Greg* there is a great deal that we have read with interest and pleasure, and there is, we fear, almost as much that we have skimmed with weariness and vexation. Happily the good and bad parts are marked out by such clear divisions that the reader has very little difficulty in keeping to one and avoiding the other. The scene of the story is laid in a manufacturing town in Lancashire. So long as the author is telling of the factory hands and using the Lancashire dialect he never fails to interest his reader. It is curious, by the way, that while we have so many admirable tales of Lancashire life, we have so few of the life of the working people of other towns. Mr. Hirst's descriptions of the life in the town which he calls Millvale will be acknowledged to be uncommonly true by all who knew Lancashire a quarter of a century or so ago. For all we know it may not be quite so true now. The poorer folk, and also those of the lower middle class, he hits off wonderfully well. The moment he passes a step or two higher, and comes among those whose talk is not provincial, he becomes commonplace and dull. His heroine is really a dreadful young lady. She is the daughter of a wealthy manufacturer, the mayor of the town. She witnesses a riot, gives evidence against the hero, who was a mill-hand, by her evidence gets him convicted though he was innocent, and in

* *Hiram Greg*. By J. Crowther Hirst. 3 vols. London: Richard Bentley & Son. 1881.

the end of course marries him. All this is, no doubt, very natural and proper, and can be brought about with the greatest ease. The author had merely to involve her father in rash speculations, to pass him through the Bankruptcy Court, to kill him off in a penitent and pathetic manner, to turn the poor hero into a well-to-do, if not a wealthy, man, to give the young people a chance of meeting, and then to marry them off as soon as the proper amount of love-making had been gone through. All this, indeed, our author does, and does fairly well. But there is an episode in the heroine's life as long as it is dull and ridiculous. Long before she had conceived the slightest attachment for the hero—at a time, indeed, when he was in Australia—she grew disgusted with her home-life. It was utterly commonplace, and she was a genius. Moreover, her parents wished to force her to marry a cold-blooded villain. She fled, in the belief that she could gain, not only a livelihood, but distinction, as an actress. We are introduced to a company which would be very tiresome even if we had not read *Nicholas Nickleby*, but which, with our recollections of Mr. Vincent Crummles's leading tragedian and low comedian, becomes insufferably dull. It is not only here that the heroine tires us; in almost every scene she is equally stupid. She certainly improves towards the end, when she becomes poor and lives with poor people. But even at her best she makes us pity the unfortunate hero who wins her. The author is not unwise in lifting the veil at the end of the story, and showing that, after seven years of married life, the poor fellow was still quite happy. He was however, we must remember, living in the wilds of Australia. With little else to contemplate but kangaroos, sheep, and gum-trees, even the heroine might prove not unattractive.

She certainly has one good point about her. She serves as an admirable foil to those characters in which our author is really strong. These characters are by no means few in number, and yet they are all distinct and clear. The sketch often is but a slight one; yet, so far as it goes, it is true to nature. We do not say that all the characters are original. There are signs in the story that the author knows Mrs. Gaskell's works. Yet there is originality more than enough to free him from any charge of mere imitation. There are some very pleasant humorous touches which go a great way to make up for—if not to excuse—the fine writing of other parts of the book. Thus we have an admirable description of the family of a mill-hand in those years of great suffering which came just before the abolition of the Corn Laws. The old grandfather was failing in his mind, and was wont to have long intervals of inattention and silence till something suddenly roused his attention, when he would bring out a quotation from the Scriptures. The son was a Chartist—and a violent one—believing that through riots and intimidation lay the path to justice and general prosperity. His wife was sick of politics, and wanted her husband to stick only to his work. He would burst out into a passion whenever he was contradicted, to the perplexity of the old man, who was roused up by hearing him angrily bang the table, and would always exclaim, "Isaac's a hot temper, but he's a good lad at th' bottom." One day the wife with some reason replied, "Th' bottom seems to get further an' further deawn every day then." The following passage will give an example of the merits of our author's writings when he is among his poor folk. Isaac's daughter, dreading her father's anger, had been wishing that "fowk 'ud be quiet." Her mother replies:—

"That's reet enow; but wishes niver made onybody's porridge. Did they, feyther?"

The old man shook his head and smiled as he answered, "No, no."

"I could wish, if wishin' were wanted," continued Mrs. Briggs, as she drew the table near to the large armchair, in which old Mr. Briggs was seated, "I could wish 'at Isaac 'ud let all this Chartist bother be. Someb'dy 'll be i' trouble thro' yesterday's doin's, an' if work's stopp'd for long we'at be hard set. Wishes isn't very nourishin' food."

"I have been young, an' now am old," began old Mr. Briggs, in a reedy voice—

"That's true," muttered his daughter-in-law, admiringly.

"—Yet have I not seen the righteous forsaken, nor his seed begging bread."

"He were more lucky nor common, then," commented the literal-minded Mrs. Briggs. "You've knowed worse times nor these, haven't you, feyther?"

The whole description of the Heather Street Chapel—the good minister, the poor congregation, their efforts at bettering themselves in soul, mind, and body, the Sunday School teaching—all this is very well done indeed. No less excellently described are two old maiden sisters, who add greatly to the happiness of their neighbours, and to the enjoyment of the reader. There is, indeed, in these three volumes so much that is good that we cannot but greatly regret that the story is not just one-third of the size. Mr. Hirst had materials for an admirable tale of moderate length. He has chosen, or he has been forced, to follow the fashion, and he has gone very far towards spoiling what ought to have been an excellent beginning in authorship. Nevertheless, with all its faults—and they are serious enough—*Hiram Greg* deserves to rank higher than four out of five of the novels which it is our fortune to have to read.

THE ENGLISH WORKS OF WYCLIF.*

IT is next to impossible for any one to write of Wyclif entirely dispassionately, even though there should be few who would

endorse all the extravagant praises that have been lavished on his memory by Protestants, or would subscribe to the condemnation pronounced upon him by all Catholic writers as a heretic against whom the indignation of God was signally manifested in his being struck with paralysis in the act of serving at Mass. The editor of this volume has steered clear of any extreme view, though it is easy to see on which side his prejudice lies, and has made a very fair defence of his *protégé* against the charge of fanaticism; but he has said not one word on another charge which is less easily disposed of. We hear a good deal in these days of clergy eating the bread of the Church whilst they preach and uphold doctrines not sanctioned by the Church. Now the most remarkable feature in Wyclif's life is that he should have continued to say Mass till the last week of his life, when it is plain that he did not believe the doctrine of the Church in which he was a priest either on this point or on many others.

We gladly welcome this volume as being really an important contribution to the history of the Church. For Catholics and Protestants alike must admit that Wyclif was in the truest sense the precursor of the Reformation. It is not so much that his doctrines tended to bring about the reformation of the sixteenth century as that they gave it in this country the particular form which it took. Any one who has looked with any care over the list of martyrs whose names figure in Foxe's *Acts and Monuments* must have been struck with the very advanced views advocated by nearly all of them, and people will, we suppose, eventually come to understand how it was that Lutheranism never had the slightest hold over the Protestant mind in England, and how it came to pass that after the separation from Rome Calvinism was dominant in the Church of this country for nearly a century. These doctrines are an inheritance directly descended from Wyclif's teaching, and the only surprising point in the pedigree is that we hear so little of them during the time which intervened between the death of Wyclif and the early part of the sixteenth century. This is one point which this well-edited volume of Wyclif's tracts will help to make plain to English readers, and for this purpose it is of little consequence whether the tracts contained in this volume are actually Wyclif's, or only reflect his teaching at second-hand. They are at least of the school of Wyclif. In other respects, we must admit that there is some disappointment at being told of almost all of the twenty-eight treatises, published under the title of "The English Works of Wyclif," that they are of very doubtful authenticity. The editor has left nothing to be desired in his brief account prefixed to each one of the tracts, but we had hoped that the expression with which the first introduction commences, "I can give no decided opinion as to authorship," would not have been repeated so often in the course of the work. But some such expression, or else a judgment more unfavourable to the genuineness, such as "I do not think this tract is by Wyclif," prefaces most of them. There are, in fact, only five or six tracts that the editor ventures unhesitatingly to ascribe to Wyclif, but the tone of all is such that any of them might have been his. There is, in fact, no marked distinction either in style or matter in any of the treatises. None of them give the reader an exalted idea of the intellectual power of the writer. Nevertheless, in illustration of the point of which we have been speaking, we prefer quoting from those which are certainly, or almost certainly, genuine. We say, then, that the characteristic marks of nearly all the heretics of the sixteenth century who were tried, and some of whom recanted, whilst others were condemned and executed, according to the barbarous law which enacted the punishment of burning for heresy, was this. The denial of the doctrine of the Mass, the assertion of the equality of priests and bishops, the objection to confession, the belief that the Pope was Antichrist, and the claim of liberty to believe or disbelieve as they found things, proved or not proved, in Scripture. Besides these points, the doctrines of election and reprobation are prominent in the works of later English reformers. And all these may be found in full bloom in one or more of these treatises of Wyclif's. The invectives against the conduct of the priests of the time are common to nearly all the treatises. With these we are not concerned here, but, after allowing largely for exaggeration, they reveal a state of wickedness which is quite appalling; and it is not to be wondered at if the judgment which people were forced to form of their ecclesiastical superiors should have ended in a prejudice against the doctrines which they professed.

The tract on Confession, which is the twenty-third printed in this volume, is described by the editor as being decidedly by Wyclif. It consists of a tirade against the law and practice of the Church of that day as regards this point, on the ground that it is a device of Antichrist, and against reason and greatly liable to abuse; and, as it was not used in the primitive Church, if the new law that enforces it is good, Christ must be to blame for not having instituted it. The remedy proposed is curious. The author admits that private confession has done good as well as harm, and suggests that confessions when made should be made to two priests, as two witnesses are better than one, and the shame of the confession would be the greater. The prevailing idea of the tract that private confession to a priest is permissible, but ought not to be compulsory, so far as it goes bears out the editor in his defence of Wyclif against the charge of fanaticism, and establishes the claim of moderation which he urges on his behalf. We need not, however, go beyond the limits of this treatise to produce evidence of Wyclif's disbelief in the doctrine of Transubstantiation. The editor observes that the attack on this doctrine at the

* *The English Works of Wyclif hitherto Unprinted.* Edited by F. D. Matthew. London: published for the Early English Text Society, by Trübner & Co. 1880.

end of the tract proves that it was one of his later writings. It is as follows:—

If thou be a priest of Christ's sect hold thee paid of his law to teach this people Christ's gospel, all if thou feignest thou no more power. For Christ hath given power enough to his priests to teach his church, and enjoined them such office that giveth them not occasion to sin. And this power that priests have standeth not in transubstanting of the host nor in making of accidents to stand by themselves. For this power granted not God to Christ nor to any apostle, and so Christ hath specially power to do away men's sin; and these miracles that be feigned, that no men may see nor know, as they waxen without profit, so they have no ground in God.

The editor has called attention to a passage in the same tract which he thinks illustrates Wyclif's predestinarian doctrine; but the expression is somewhat rhetorical and capable of an orthodox sense. It would have been more to the point if he had noticed in the same sentence an expression which implies a belief that the baptism of John and our Saviour were the same in effect, for here he was the forerunner of the English Reformers, all of whom appear to have believed this, this being the burden of every note in the Edwardian editions of the English Testament which could possibly be saddled with a note to that effect. There is another passage, however, in the same tract which might have been quoted, where he argues against priestly absolution on the ground that the priest may possibly have been "ordained to be damned." However, it is not worth showing, as the point will hardly be contested that Wyclif on this doctrine anticipated the horrible doctrine that is commonly associated with the name of Calvin.

In the following tract, on "Faith, Hope, and Charity," which title Mr. Arnold and our editor consider to be authentic, there is an expression which implies that there were already persons in that age who adopted Antinomian opinions. The editor says he should not have expected to find such opinions prevalent amongst Wyclif's hearers. But it is wonderful to see how Calvinistic doctrine has always developed rapidly, accordingly to the character of its victims, into a gloomy piety or a rampant Antinomianism such as Wyclif describes as issuing in the avowal, "Let me sin enough, for God will never lose that he hath dear bought." If this tract is Wyclif's, it is decided on other grounds to be one of his later productions, and, if so, we may say that he lived long enough to see the fruits of his own teaching.

We must not conclude this article without noticing the style of editing, which really leaves nothing to be desired. Mr. Matthew has sufficient appreciation of his author to enable him to do his work thoroughly, and sufficient impartiality to judge him fairly. Probably his estimate of Wyclif's excellences is widely different from ours, but his introduction gives us all the information that can be gathered about the author. He says that his object has been to complete the publication of Wyclif's English works. He has not only done this, but he has prefixed to each of the twenty-eight treatises included in the volume a brief history as well as a summary of its contents. There is added a marginal analysis, which will be of great use to those who are not accustomed to the style of writing, which, it must be admitted, is difficult to make out. At the end there are some notes, with illustrations, from Wyclif's works as well as from other sources, and last of all a Glossarial Index, by which is meant apparently a glossary and index all in one—part of it consisting of explanations of unusual and obsolete words, and part being really an index of reference. We have, however, looked in vain for an explanation of one of the counts on which Wyclif was indicted. Amongst the ten heretical opinions which are charged against Wyclif on his citation before Courtney, Archbishop of Canterbury, at the Grey Friars in London, the sixth is "That God ought to obey the devil." Three of Wyclif's adherents in answering to these charges give very shuffling and evasive answers, and from their answer to this which is the sixth we are unable to gather any satisfactory account of what the charge really meant. Collier in his history tells us that "their answer to the sixth conclusion being judged insufficient, they were interrogated whether any sort of obedience was due from God to the devil; they replied there was in a qualified sense, that is, an obedience of charity as they term it; because, as they farther explain themselves, the Supreme Being loves that apostate spirit, and owes him a duty of punishment." That this answer is a mere evasion is quite evident. The real meaning of the expression that "God ought to obey the Devil," we conjecture to be that, as God had by an eternal decree con-signed certain persons to reprobation, He must as a necessary consequence consent to such methods as the Devil should adopt in carrying out that decree. However, we hear nothing of this opinion in the treatises printed in this volume, and we suppose that the editor did not feel bound to criticize all Wyclif's opinions because he had undertaken the office of editing his hitherto unprinted works.

BOOKBINDINGS, ANCIENT AND MODERN.

BOOKBINDINGS are becoming almost as highly prized as Oriental porcelain or Limoges enamels in the *bric-a-brac* market. No articles seem much less beautiful or desirable, to the untrained eye, than old bookbindings. Very often, when the book is worthless, the boards raise its price to as much as 100*l.* Boards of leather, yellowish in some places, faded green in others, stamped with a plate of the Crucifixion, and adorned with death-

heads, were eagerly competed for three years ago at a public auction. The book they contained was a hopelessly dead piece of casuistic theology, but it had belonged to Henri III., and was esteemed as a relic of that great monarch. Rarity, age, and certain qualities of style are the points in a binding which the modern amateur requires. It is also necessary, or highly desirable, that the work should have belonged to some famous collector of old time. There is a kind of reason in this caprice. Grolier and De Thou, Isabella d'Este, and D'Hoyrn and Longepierre took great pains to see that books were in the best possible condition before they had them bound in liveries of morocco or limp vellum. The Elsevir Cicero which belonged to D'Hoyrn, for example, has been in many hands during the last fifty years, and at every change is likely to fetch a higher price, because it is an undeniably beautiful book. The fashion of collecting historical bindings has thus a practical and a sentimental explanation. In the first place, the books of the old fanciers are almost certain to be clean and "large." In the second place, there is a certain obvious pleasure in being surrounded by the volumes of famous students. It is like being admitted into the best literary society of the past. Your Greek classics may be Aldines, printed on the largest paper, and once carefully handled by Grolier or Maioli. Your old French histories may have been among the treasures of De Thou, and may be blazoned with one or other of his three successive coats of arms. Your Molières of the first edition may even bear the south-east of Louis XIV. M. Paul Lacroix picked up a *Tartuffe* in this condition for a couple of francs. Here it should be said that all books stamped with the Royal arms need not necessarily have been in the Royal library. The stamp seems to have been sometimes impressed on prize-books in certain of the French schools. But to return to our old bindings, it is possible to procure the *De Imitatione Christi* stamped with sacred emblems, and with the arms of Mme. de Maintenon. This is the copy which contains the engraving of Mme. de Maintenon saying her prayers at Saint-Oyr, when the roof of the chapel miraculously opens, and a heavenly voice exclaims, "This is she in whose beauty the King is well pleased." The engraving and its legend were soon suppressed, being thought a little indiscreet. There are a hundred such examples of books the student would like to have. Bossuet's Molière is in existence somewhere, we believe, and the well-bound Rabelais of Mme. de Pompadour. The lover of Greek pastoral poetry, if rich and fortunate, may secure the Theocritus which Longepierre, the translator of bucolic verse, had bound and stamped with his golden fleece. The golden fleece of the Argonautic expedition, by the way, was only a book on the transmutation of metals, bound in sheepskin, and coveted by Jason and other Greek fanciers of the period. This at least was the theory of the learned Suidas, according to Mr. Cundall, whose work, *Bookbindings, Ancient and Modern*, we have too long delayed to approach. Our object has been to show the kind of interest which old bookbindings possess, and to justify, as far as possible, the ways of the collector to men. It is scarcely necessary to add that in book-binding as in all the crafts, the old work is the better, sounder, and more cunningly ornamented. Derome and Duseuil, Eve and Le Gascon, lived before the evil days of machinery and aniline dyes.

In writing on bindings, Mr. Cundall begins at the very beginning, like the author of the famous tract *De Bibliothecis Antediluvianis*. He cannot, like that writer, tell us much about the libraries of Seth and Enoch, but, in revenge, he is acquainted with the Assyrian style. The Assyrians bound their clay tablets by enclosing them in clay receptacles, which had to be broken before the contents could be reached. A long account of the Roman way of arranging MSS. is given, and, with its smooth red cover, its gold bosses, its gold cylinder, its perfumed illuminated leaves, a presentation copy of Catullus must have been a very beautiful object. We almost wonder that no rich modern bibliophile has distinguished himself by "getting up" a few classical MSS. in the classical style. It is scarcely necessary to say that Roman, like modern, binders waged unrelenting war against margins and rough edges. What is there in our fallen human nature that makes a binder miserable if he does not crop a book to the quick? Binders must know by this time that it spoils the value of their work. But they will do it, and we can only suppose that there must be some secret joy in the process. And so it was with the Roman bibliopæga. "His first operation was to cut the margin above and below perfectly even, and the sheets at the beginning and end square." One can imagine Cicero or Lucullus imploring the binder to leave the rough edges, and imploring in vain. But a Roman could do what is out of our power. Binders were often slaves, and an angry amateur would throw the cropper to feed the lampreys.

Medieval bindings were generally of carved ivory, of metal, or of wood covered with stamped leather, adorned with bosses of gold, with gems, and with precious stones. Mr. Cundall publishes a photograph of a remarkably beautiful ivory cover of the Gospels, executed in the ninth century. The drapery of the Virgin in this work is still classical, more so, indeed, than are the draperies in the Milan Iliad, some four centuries earlier. The upper parts of the flying angels are designed with much grace and science. Books bound in ivory, in metals, or in covers with bosses could not be kept on shelves like modern volumes; they would have scratched each other. Each therefore had its golden cabinet, or at least its embroidered silken case, called *chemise* in old French. Leather covers, when used at all, were stamped, and this is perhaps the oldest sort of printing. So Mr. Cundall says, quoting M. Libri.

but classical cases of stamping readily occur to the mind. With the introduction of printing, regular bookbinding in the modern sense of the word began. People still used wooden covers and stamped pigskin, but the Italians of the early sixteenth century introduced a lighter style. When all artists were fond of decorative work, designs for tooling were quickly supplied. The volumes for Aldus at Venice set an example, and Italian tooling soon reached the perfection which we admire in work done, first for Mailli and then for Grolier. The decoration of books has always followed, more or less closely, the lines laid down by the artists who worked for Grolier. Beginning with varied geometrical patterns (as decoration always does begin), artists gradually filled up the empty spaces with representations of flowers, with line traceries, and with the dotted arrangements called *dentelles*. The taste of the French Court in the time of Henri II. and of Francis I. introduced graceful and romantic devices, such as the blended initials of Henri and Diane; the crescent, the bow, and the quiver: the *marguerites* of Marguerite, the salamander of Francis I.; the funeral symbols of Henri III. In the age of Louis XIII., Le Gascon executed bindings with decorations of less meaning, but of more beauty. In the reign of Louis XIV. it became usual to impress a volume with the arms of its owner, a useful sort of mark, but not so elegant as the rich tooling of Le Gascon. The eighteenth century was one of opulent decadence—a glorious sunset of art. Mosaics of various-coloured leather were invented, and one of the most sumptuous bindings extant was devised to cover the Regent's copy of *Daphnis and Chloë*. Mme. du Barry had an improvised library of cheap books appropriately bound in rose morocco. Some good plain bindings of that age are always attributed by English booksellers very much at random to Derome. The Revolution ruined the art of binding. Morocco was thought culpable aristocratic luxury, and coats of arms, of course, were an insult to the Republic. Bozérian in later years had a high reputation, which he has since lost. There lies before us an Aldine *Justinus* bound by him in red morocco, which is all very well, but Bozérian has lined the inside with orange silk! This is almost as ugly as the gold paper which once threatened to supersede marbled paper. Books *doublés* with morocco seem to have been almost unheard of before Le Gascon bound the famous *Guirlande* for Julie de Rambouillet. The most famous of all binders, M. Bauzonnet, is but lately dead. We think Mr. Cundall too generous in his praise of modern English binders. Time will probably deal hardly with their work. Roger Payne was of another school. Payne is almost the only English book-binder who has acquired true fame. He was industrious, honest, but illiterate and not very sober. "Barley wine my British Muse inspires," he declared. We may quote, from Mr. Cundall's book, one of Payne's characteristic letters:—

Venerit Prædium Rusticum Pangus MDCLXXIV. Bound in the very best manner, in the finest Green Morocco, the Back Lined with Red Morocco.

Fine Drawing paper & very neat morocco joints inside. There was a few leaves stained at the foredge which is washed and cleaned, o. o. 6.

The subject of the book being Rusticum, I have ventured to put the Vine Wreath on it. I hope I have not bound it in too rich a manner for the book. It takes up a great deal of time to do these Vine Wreaths. I guess within Time I am certain of measuring and working the different and various small Tools required to fill up the Vine Wreath that it takes very near a days Work in finishing the two sides only of the book. But I wished to do my best for the Work—and at the same time I cannot expect to charge a full and proper price for the Work, and hope that the price will not only be found reasonable but cheap, o. o. 18 o.

Modern English bookbinding, like other decorative crafts, suffers from the competition of machinery. Our cloth-covered books, just as they come from the publishers, last so well in many cases that no binding is absolutely necessary. French stitched books soon fall to pieces; therefore binding prospers better in that country.

WOLTMANN'S HISTORY OF PAINTING.*

PROFESSOR SIDNEY COLVIN introduces this massive volume to the English public with a brief but eulogistic preface. It cannot be said that the original work is by any means well known in this country, where the earlier compendium of Dr. Kugler still enjoys considerable prestige, and a circulation that does not seem to have diminished, although the book itself has become antiquated. It takes some time for a work on so huge a scale as that now before us to gain the confidence of the public, and this new history of painting labours under the disadvantage that its author has died, leaving only a fragment behind him. Dr. Alfred Woltmann, who was Professor of Fine Art at the University of Strasburg, was an unrivalled authority on certain branches of mediæval art. We believe that he had no equal in his knowledge of the history of miniature painting down to the middle of the fourteenth century. In beginning the great work he set himself to execute, he was sybaritic enough to begin with the epoch he liked the best and had studied most lovingly, and, in bringing out the first volume of his history, confided half of the work—namely, those chapters which deal with Egyptian, Asiatic, Greek, and Roman painting—to his friend, Dr. Karl Woermann,

of Düsseldorf. His own share of the work was concluded as far as Meister Wilhelm in Germany and Spinello Aretino in Italy. Unhappily he died in the spring of 1880, and no more of his book has appeared. We learn, however, that a continuation is being produced by Dr. Woermann, which, if pursued in the same leisurely manner as the first instalment, promises to constitute one of the largest books in existence. We are, however, far from denying the value of such compilations. The researches of the present day are so wide and so minute, their results are concealed in so many ephemeral publications, and the difficulty of surveying them is so extreme, that the man who unites them in a single work, however bulky that work may be, deserves well of all who study his subject. Still, since Dr. Kugler's day is over, and he is relegated to the garret and the dust-bin, we must be malicious enough to observe that he wrote in a very much more agreeable manner than Dr. Woltmann, who is a miracle of lumbering Teutonism. In revising the translation, which is clear and serviceable, Mr. Colvin remarks that "he has considered it within his province to venture upon an occasional abridgment," and in the mouth of so conservative an authority we take this acknowledgment as meaning a good deal. Mr. Colvin pleads almost passionately for a recognition of Dr. Woltmann's merits, and claims for his book the credit of being "the most complete and trustworthy History of Painting yet written." No one is more competent than he to judge whether this is so or not, but it seems a pity that the standard work on a most fascinating subject should be one so exceedingly dull. A treatise may be too full of knowledge and research; "on hasarde de perdre en voulant trop gagner," and a more eloquent volume might have been more welcome—such a volume, may we dare to say, as Mr. Colvin might very well have written with the secret assistance of the laborious Dr. Woltmann.

Either Dr. Woermann is a more pleasing writer than his late colleague, or the subjects with which he deals have more general interest, for we have not found the same languor in his pages as awaited us in those of Dr. Woltmann. The chapter in which he sums up what is known of Greek painting is especially interesting, and should be read in connexion with Mr. Murray's late contribution to our knowledge of early Greek sculpture. It is strange to learn that the contemporary popularity of the painters whose work is so completely lost for us was at least as great as that of the sculptors of whose style and general principles of design we can form a very just idea. The old story of the maiden who drew the outline of her lover's shadow on the wall is given as the beginning of the art of draughtsmanship, and step by step the progress of elementary painting is recorded. Much later on a certain Kimon of Kleonai is supposed to have invented drawing in profile, although this seems to go against all probability. The original silhouette of the lover must have been a profile, and the salient points of a face seen from the side present much less difficulty than the internal detail of a front view. It would be more intelligible if we were told that it was Kimon who first thought of designing features within the oval of a front face, and of expressing emotion by the direction of these features. What is further recorded of Kimon tends to this view, for he is reported to have introduced the drawing of folds in drapery, and veins—or rather, surely, muscles—in human limbs. Kimon is supposed to have flourished as late as the time of the Persian wars, and the earliest painter who seems to have reached anything like technical accomplishment was a contemporary of Pheidias, Polygnotos. He and his pupils carried out the great mural paintings with which the public buildings of Athens were decorated during the supremacy of the statesman Kimon; one of these pupils was Pausanias, a near relative of Pheidias himself. It would be extremely interesting to us to be enabled to form some definite idea of the style of these great artists, whose work has entirely vanished. Pausanias has left a description of the frescoes executed by Polygnotos in the Leschê of the Knidians at Delphi, and this description has tormented the curiosity and ingenuity of modern critics. An Athenian, Apollodoros, who flourished at the beginning of the Peloponnesian wars, was the first painter who attempted to carry out the modern idea of perspective, or who understood the principles of chiaroscuro. Hence he was known as the shadow-draughtsman, *σκιαγράφος*, a word which has been contorted in modern Greek into the name for a person who sketches in outline. The men whose names we have mentioned, together with an obscurer person, Agatharchos, form a school that has been called the Archaic Attic. The full development of Greek painting took place, not at Athens but in Asia, and is connected with the illustrious names of Zeuxis and Parrhasios. Zeuxis was an Italian by birth, who formed his style under Apollodoros, and who then went over to Ephesus and settled there. His love of display and personal grandeur reminds us of Rubens. At the Olympic festival he wore a garment into the hem of which his name was woven in gold letters. It is worthy of remark that he was the first person who ever exhibited his works of art and collected entrance-money at the door of the show. That he was not above applying to "alliteration's artful aid" is proved by his motto,

μυμήσεται τις μάλλον ἢ μίμῃσται.

"Easier to carp at than to copy." In all that we read about Zeuxis we find evidence of a creature "great in heart and brain, that did love beauty only," and to whom the magnificence of his own powers and originality came like the intoxication of new wine. He was full of a sort of naïve exultation at his own genius, and was admired without stint and without criticism by his

* *History of Painting.* From the German by the late Dr. Alfred Woltmann and Dr. Karl Woermann. Edited by Sidney Colvin. Vol. I. Ancient, Early Christian, and Mediæval Painting. London: C. Kegan Paul & Co.

wondering contemporaries. He pronounced himself unsurpassable, and at last he died of the ungovernable laughter caused him by the humour he had thrown into the expression of an old woman in one of his own pictures. After so sublime a vanity, the self-satisfaction of Parrhasios, who boasted that his painting had deceived even Zeuxis himself, appears tame and ordinary. We should perhaps be in better humour with these conceited Greek painters if their posterity had contrived to save a single specimen of their actual work for us to admire. As it is, the attempt to rebuild their productions and to recover their style is almost as hopeless as to find out what song it was that the Sirens sang to Ulysses.

After having restored, as far as can possibly be done from tradition, the biographies and the styles of these and the other important ancient painters, closing the list with the name of the decorator Ludius, the only very original designer that Rome seems to have produced without the aid of Greece, Dr. Woltmann retraces his steps and examines the existing remains of ancient painting, the figured vases used in sepulchral ceremonial, the so-called Pelasgic ware which presents us with this art in its most archaic form, down to the delicate Athenian funeral vases painted in colours on a white ground, and the Apulian vases of late Italian style. From the consideration of these he is led to what seems to us, from existing specimens, to have been a more accomplished art, that of engraving on bronze toilet-cases and mirrors, and particularly to the examination of the Ficoroni cista, now preserved in the Museum Kircherianum of Rome. It is a pity that only one fragment of the beautiful designs lavished upon this ornament has been given among the illustrations. In dealing with what is certainly the antique example which gives us the best idea we possess of the powers of the ancients in mere draughtsmanship, it would have been very interesting to supply a series of reproductions from the cista itself. The subject chosen for illustration is a portion of the chastisement of the giant Amykos, and the figure of the young man who watches the scourging from the deck of his ship is, as the editor remarks, in every way worthy of the finest Italian drawing of the fifteenth century. A great deal of the later Pompeian painting that is best known as archaic art to the public, is so imperfect in composition and draughtsmanship that it is extremely valuable to have this proof that, in the third century B.C., at all events, the graphic powers of the Greeks were in no way inferior to their plastic powers.

We must not, however, do injustice to those laborious chapters in which Dr. Woltmann has inscribed his extraordinary knowledge of mediæval art. We can but roughly indicate the progress of his disquisition. He begins with the first shy flirtation of the early Christians with mural painting in its rudest form. He traces the development of Christian symbolism, and its ossification into those hieratic types which are roughly called Byzantine. It is curious to note that, rude as the art of the catacombs was, it was yet an art of decline, that it deteriorated with the decadence of classical culture, and ceased to move altogether when the classical tradition ceased to exist. From the paintings in the catacombs and the first dawnings of work in gilt glass, we proceed to the use of mosaics in the churches, and are introduced to the great schools of mosaic at Rome and at Ravenna. The Italian decline and the rise of what is more exactly known as Byzantine work is then examined, and this chapter closes with a bird's-eye view of art in the Roman Empire after the days of Justinian. The next chapter is dedicated to the discussion of that subject which Dr. Woltmann had more particularly made his own, and in which no one has pursued investigation further than he. The earliest practice of the art of miniature and illumination of MSS., Greek, Western, and Syrian, are carefully gone into; while the curious result to art of the iconoclastic schism between the Greek and Latin churches, and the new style which presently resulted from the contact of barbaric elements with the latter body, gradually lead us on to what may more properly be defined as the mediæval period. Mural painting and mosaic now give way to miniature as the ruling art of the Christian world, until the patronage of Charlemagne enlarges the field to a wider ambition. After a careful critical survey of the Carolingian age, we return to Byzantium, and chronicle the singular revival in art which occurred there in the ninth and tenth centuries. From the final decline of Byzantine painting we return to Western Europe, now advancing into the Romanesque period of mediæval art, and from this point Dr. Woltmann conducts us through tracts less dark to the ordinary art student down to the comparatively light and familiar regions of the thirteenth century, and so, with a brief summary of early painting as it existed among the Mahomedan races, we are brought to the close of an exhaustive volume, which we have no doubt will, in spite of its bulk, be of very wide service to a large class of readers.

AMY WYNTER.*

THE three-volume novels of the present day may be roughly divided into three classes. There is the work of the practised author, very generally a lady, who spins it out to the medium regulation length with a facility which is more remarkable than the fertility of invention. There is the novel that has covered the indispensable distance with difficulty, showing, by its widely-printed lines and

broad margins, how hardly the writer has been driven to eke out invention with verbiage. And there is the novel, usually the production of a novice, which sins on the side of length and discouragement, though showing conscientious workmanship and decided talent. We place *Amy Wynter* in the last of the three categories. Mr. Pinkerton presents himself to us on the title-page as the author of *Crossford*, and therefore we must assume that he has had some preliminary experience. He strikes us, nevertheless, as a promising novice, who, with practice and careful self-education, will probably do superior work. *Amy Wynter*, though inconsequent and unduly prolonged, is by no means a dull novel. There are well-conceived scenes and amusing chapters; while on subjects more immediately connected with country amusements and field sports the author is evidently at home. But he is something more than merely a lively sporting writer. He gives proof of cultivation, of literary research, and of having digested what he has read. We cannot say that he shows a natural genius for fiction, though he possesses talents and capabilities which he may develop and improve. We take no exception to there being no particular plot, since it seems to us that the existence of a plot nowadays is the exception rather than the rule. But he has not acquired the habit of self-control; he indulges recklessly in digressions which may be entertaining in themselves, but are linked by almost imperceptible threads to the story; and when he has conceived a creditable character, he loses the grasp before he has made his readers realize it, so that we have to interest ourselves in his personages very much at haphazard, and some of them who are intended to be subordinate impress us by far the most favourably.

After what we have said, it will be readily assumed that the characters are crowded and somewhat confused. A brief prologue, dated eighteen years before the beginning of the actual story, prepares the way ingeniously enough for the jumble of incidents that are to follow. Wynter and Basil Stillingwood are discussing the domestic circumstances of the former gentleman in all the freedom of confidential friendship. Wynter, a man of good family and fortune, has married a few months before for love, and is already beginning to repent it. A vain and weak man, and intensely selfish, he insinuates his intention of adopting a course of procedure which scandalizes and shocks his more generous friend. He is beginning to suffer from incompatibility of station, if not of temper, with the humbly-born woman who had caught his fancy. He has discovered that there was a legal flaw in the ceremony that united them; and he half urges that, in her interests as well as his own, it might be well for them to avail themselves of the *locus penitentie*. They might arrange to separate quietly, and nobody need be any the wiser. If Wynter had wished to feel the pulse of public opinion in the tentative suggestions he has made to Stillingwood, the attitude of his friend was sufficiently decided. But, unfortunately for the infant who is yet unborn, Wynter is as obstinate as he is weak, and the strongest point in his nature is its selfishness. He covers an awkward retreat with an ebullition of insolence, which almost leads to a definite quarrel. He does not positively put away his wife; but, as it appears from the sequel of the story, he never does her justice by formally repeating the marriage ceremony. Yet he cannot afford to break with Stillingwood, and he has contrived to impose on his kindness. When we meet Basil again he is a middle-aged man, and acting guardian to the fascinating heroine of the novel. Amy Wynter has grown into a pretty girl of eighteen, who is living on the easiest terms of intimacy with Stillingwood and his nephew and presumptive heir. According to all appearances, her sisterly affection for Clement would have ripened into a warmer feeling; and the marriage that Basil seems to expect must have cut the novel short in its inception. But the long absent Wynter turns up unexpectedly, and comes sailing one fine morning in his luxurious yacht into the little harbour of Shelston. And we must say that our old acquaintance as he reappears, is very cleverly and artistically represented to us. The selfish and careless young man, who had life and all the world before him, is become very much what we should have expected after eighteen years of idle self-indulgence. Free-living has naturally made him a valetudinarian. He is wedded to the egotistical habits on which his existence has been regulated; and, when he shows himself civil or affable to anybody, we may safely set it down to interested considerations. But he has become more dogged than before in standing on his rights; judging others by himself, he suspects self-interested motives in the most improbable quarters; and any resolution he may come to is recommended to him by the circumstance that it is likely to be disagreeable to somebody else. Gratitude is a virtue to which he makes no pretensions; and possibly he has never forgiven his old friend Stillingwood for the frankness of his language at a very critical moment in his career. So he asserts his claim to his deserted daughter Amy, with an unyielding but courteous *aplomb* to which Stillingwood is forced to give way. Why he should have decided to saddle himself with Amy at all; why he should have been induced at that particular moment to take up his abode in his ancestral halls, and bore himself with uncongenial county society are questions which it is difficult to answer. We can only suggest that the author, having a story to tell, compelled the unbending Wynter to bow his cap to its exigencies. Be that as it may, Wynter exchanges a life on the ocean wave for the restraints of his seat of Oakwood, and Amy receives "the route" with brief time for packing up. Now, as that young lady plays the part of leading heroine, we had hoped to see her in transports of despair. Basil Stillingwood had been more

* *Amy Wynter*. A Novel. By Thos. A. Pinkerton, Author of "*Crossford*." 3 vols. London: S. Tinsley & Co. 1880.

than a father to her, and Clement his nephew had apparently touched her heart. But Amy, with her bright and volatile nature, shows more than the proverbial fickleness of her sex; and her conduct is not at all what we should have looked for in a young woman who gives her name to a book. She goes dutifully with her cynical and wealthy father, accommodating herself to the humours of that middle-aged voluptuary. She consents to give up all constant intercourse with Basil Stillingwood, though she greets her adoptive father with smiling affection when they do chance to come across each other. And finally, in the familiar American phrase, she quickly gives poor Clement Stillingwood "the mitten"; while he, on his side, seeks consolation elsewhere. She has been happy in finding another admirer in Squire Michelmore, a noble specimen of muscular humanity, and the pair are not unsuitably matched. By this time, by the way, the elder Stillingwood, through force of circumstances, has been replaced in the thankless office of guardian; and it is consistent with the genial elasticity of his nature that he encourages the new aspirant to Miss Wynter's hand. Amy has become a great heiress, and Mr. Michelmore, though nominal proprietor of a good estate and representative of an old county family, is many years her senior, is heavily embarrassed, and is a gentleman who has sown his wild oats by the bushel. But the good-natured Stillingwood encourages his diffidence when Michelmore is making his slow and cautious approaches; so that, when he contemplated a protracted siege in form, he finds the place handed over to him without conditions.

We have disentangled the leading thread of the story from a maze of digressions that are inextricably involved. Without, as we believe, intending it, the author is decidedly communistic in his intermingling of the various grades of society. The scene of the tale gives him exceptional opportunities in this respect. Shelston is a rising, or rather a struggling, watering-place; and the country residences of Messrs. Wynter, Stillingwood, and Michelmore chance to be situated in the immediate neighbourhood. It is true that Mr. Wynter holds himself somewhat aloof; but then we know that he was naturally a misanthrope. Mr. Basil Stillingwood, on the contrary, shows his sociability and easy good nature by making himself hail-fellow-well-met with all ranks and conditions of men. He drops into the commercial room at the inn, making friends with any casual customer. So that we are less surprised than we should otherwise have been to find him hobnobbing with a voluble French bagman over the bottle of champagne which he has generously "stood" to that intelligent foreigner, and chopping political economy with the stranger, who speaks a most fantastic jargon of broken English. Received on terms of equality at Squire Stillingwood's house are a Mrs. and Miss Langdon, who let lodgings, and sometimes condescend to wait upon their lodgers. Julia Langdon, who happens to be extraordinarily handsome, has captivated the heart of Clement Stillingwood; and the uncle, who has encouraged her intimacy with his wealthy ward, Miss Wynter, logically approves the engagement with his heir. No doubt Mrs. Langdon's husband had been by birth a gentleman, who had broken away before the marriage beyond the confines of Bohemia, and gone upon the London "boards." But we do not believe that his antecedents would have been much of a recommendation to his widow and children in the somewhat straitened circle of an old-fashioned county coterie. Chief among the cleverly drawn subordinate characters we have referred to is "Dicky Yeoland," the Rector of Shelston; but Dicky, after filling a disproportionate space in the pages, is suddenly shipped away to the antipodes most improbably and unceremoniously. He is the son of a rich *parvenu*, who has purchased the living as an investment, thereby placing his son in an impossibly false position; for the nominal incomes are 900*l.*, and Mr. Yeoland, senior, who is known to be almost a millionaire, has placed the revenue under stoppages to the extent of 700*l.* Nevertheless, Dicky, with only 200*l.* to spend, with an expensive rectory house and costly grounds to keep up, and with the many claims to satisfy that come inevitably upon a clergyman, manages somehow to keep up appearances on this miserable margin. The humorous side of Dicky's false situation is that, while professionally a parson, he is at heart a farmer; and, indeed, had been arbitrarily taken from the plough to be forced into the pulpit. He detests things ecclesiastical and all appertaining to them; he never addresses his congregation without a tremor; and on the only occasion when he made a hit he had discoursed to them practically on the parable of the Sower. Still it was carrying his agricultural predilections rather far to drop the gown from his shoulders at a moment's notice and renounce the reversion of an unencumbered living for the post of manager with a probable partnership on a sheep farm in New Zealand. But the Rev. Mr. Yeoland's clerical career, with its summary *dénouement*, is a fair specimen of the mixed matter of the novel. There is a blending of the clever, the incoherent, and the commonplace, which undoubtedly tries our patience from time to time, but which carries us with tolerable satisfaction to the end of the story.

GEIKIE'S PREHISTORIC EUROPE.*

IN *Prehistoric Europe* Professor Geikie goes necessarily over much of the ground traversed not long ago by Professor Boyd Dawkins in *Prehistoric Man in Britain*, the wider scope of the

survey bringing at the same time more systematically under view the relations between our existing island group and the continent of which it once no doubt formed a part. The general agreement between these eminent palæontologists may be taken by the public at large as a sufficient testimony to the solidity of the basis on which has been built up the comparatively recent science of prehistoric archaeology, and to the trustworthiness both of the materials and the methods which have combined to make up the fabric. The vastly enhanced range of time to be assigned to the life of man in comparison with the limits allowed even by geologists of a generation back; the proofs of man's having had for contemporaries within our own era manifold forms of animals believed till lately to have been limited to widely different ages and climates; the clear lines which have been made to mark the successive waves or marches whereby distinct tribes of mankind have made their way from the primeval centre or fount of population, bringing with them the implements, weapons, and other tokens of art and skill which now serve as an index to their respective stages of progress—these stand as elementary propositions or axioms, not less fixed than the fundamental periods, the determination of which half a century ago gave to the study of the earth's crust the dignity and authority of a science. It seems only the other day when everybody thought he knew the year of the creation of man. There were even adventurous chronologists who gave out the day of the month as well as of the week when Adam first saw the light. Now the critical question for chronology has become, whether it is by the million or by the hundred thousand that we are to measure the span of man's existence upon the earth. We find widely scattered over our globe relics of human workmanship without number, with not a few fragments of man's bony frame, which beyond reasonable doubt belong to a time so far removed from our own that neither history nor tradition tells us anything about them. It is from these relics themselves, from their position and the local conditions under which they are found in and upon our soils and subsoils, that we have to discover what we can of the life-history of the people to whose presence they testify, and to picture to ourselves the external conditions under which these early races lived, with the changes that the aspect of the earth has undergone since they passed away. Towards the solution of this problem Professor James Geikie brings a connected and well-nigh exhaustive summary of the evidence accumulated by the widest and most recent research. In seeking to classify the relics of antiquity which have come to light from burial places, primitive dwellings, forts, and camps, archaeologists have agreed upon the elementary basis laid down. Prehistoric time has by common consent been divided into three periods, known respectively as the Stone, the Bronze, and the Iron Age. In these we recognize simply so many distinct phases of civilization, not necessarily divided in time, for stone, bronze, and iron may have been, as they are now, in use contemporaneously in different parts of the earth or even of one continent. The transition from the Stone Age to that of Bronze in Western Europe may be held with reason to have been the most sudden and strongly-marked, metallurgical knowledge having been brought hitherwards with one of those great folk-waves which Professor Geikie pictures as successively sweeping over Europe. It is not, however, with the periods marked by the use of the metals that the present inquiry is mainly concerned; for, from a geological point of view, the Europe of the later Bronze period at least was very much the same as it is to-day. No great alteration in the earth's surface or in the distribution of land and water has taken place within that range of time, and the pages before us are consequently occupied chiefly with the climatic and geographical changes which supervened during the true Stone Age.

The area of our author's special research is still more narrowly defined by the line sharply to be drawn between the earlier and the later Stone Age. Before passing on to consider the cause of this vast gap or hiatus, the change of climate being beyond doubt the most important fact in the problem, it is needful to take note of the points of evidence which clearly mark off palæolithic man from his successor of the neolithic type. Nearly all the palæolithic implements, for instance, are formed of flint or chert, most commonly of the former, the neolithic consisting of many varieties of hard stone; flint at the same time being retained for arrow heads or implements requiring a cutting edge or a sharp point. Bone and horn were also in use from the earliest known time. Palæolithic man was beyond question a true troglodyte, the caves in which he lived being very numerous, and exhibiting marked traces of his habits and condition. His early grasp of art is shown in the expressive outlines of contemporary animals—the mammoth, the elk, the horse, the bear, and the human form itself rudely scratched upon fragments of bone found in France, Switzerland, England, and elsewhere. That the superior art of workmanship like this necessarily attests a later stage of palæolithic antiquity is a matter rather of inference than of proof. No such principle of classification is to be accepted as trustworthy. Relative progress of this kind may have been due to local conditions quite as much as to lapse of time. The artistic stone folk wandered sometimes far afield. Drawings of seals and of a large cetacean have been discovered in certain caves in the Pyrenees, and far inland have been found sea-shells, some from the Atlantic coast, some from the Mediterranean, brought back probably by the reindeer hunters from their traffic with the coast-dwellers. Of the people themselves but few skulls or fragments of skeletons have been preserved. Professor Geikie's list soon exhausting the remains of our palæolithic ancestors. Within the period of their occupation

* *Prehistoric Europe: a Geological Sketch.* By James Geikie, LL.D., F.R.S., of H.M. Geological Survey of Scotland, &c. Maps and Illustrations. London: E. Stanford. 1881.

of Europe, extraordinary changes of climate are proved to have taken place, with the extent and the consequences of which the bulk of Professor Geikie's able and interesting work is taken up. To these changes the fauna and flora of the Pleistocene period, to which this earliest traceable stage of human life was limited, alike bear witness. Beginning apparently with a singularly mild and equable range of climate, that period came to a close under conditions of extreme severity, after alternations of no slight extent, though of no known duration, giving rise to great migrations and numerous extinctions or modifications of species, determining in great measure the present peculiar distribution of living forms. With the close of the Pleistocene, which corresponds, as our author's proofs go to show, in the main with the Glacial age, the European climate may be regarded as having settled down to its historical and existing average. That age began when the genial climatic conditions of the Pliocene were passing away. In the interglacial beds which betoken the changes of temperature within its range, as in the Pleistocene river-gravels, lignites, travertines, loams, and cave-accumulations, the plants and animals are associated with the relics of Palæolithic man in the rudest form. In the equable and genial climate prevalent at such intervals in Western Europe, animals now relegated to widely-separated zones lived throughout the year, and the hippopotamus, the elephant, the rhinoceros, the Irish deer, and the bison ranged with the horse and the ox from the borders of the Mediterranean as far north as mid-England and Northern Germany. That animals of what we are accustomed to call sub-tropical races kept these northern haunts all the year round, instead of migrating southwards for the winter, is a point upon which palæontologists have hitherto been by no means so strongly convinced as our author avows himself to be. May there not have been from our latitude a retreat to more southerly winter pastures whilst Great Britain still maintained its connexion with the Continent, the result of the breaking down of this bridge being their extinction through the effects of cold? At all events, whatever may have brought to an end the whole class of sub-tropical fauna in Northern Europe, overwhelming evidence points to a period of intense cold having supervened towards the close of the Pleistocene period. The facts adduced by our author lead him to conclusions which would have seemed beyond belief to the geologists of a generation ago, and may be not a little startling to less advanced students of nature even now. In Professor Geikie's survey of the Glacial period the northern ice sheet is seen extending as far south as Gibraltar, Malta, and Cyprus. That it failed in Britain to reach, as he allows, further south than the valley of the Thames can hardly have been due to the mitigating effect of the sea upon the climate of our southern shores, our insular condition not having then existed. We could wish for some more definite consideration of this point, as also of the strange hiatus in our author's reasoning when he writes, "At present the winter temperature (January) of Gibraltar is 54° 7' F., while that of Malta is 54° 5' F., so that it is not unreasonable to suppose that during the Glacial period heavy snow in winter may have covered the more elevated parts of Malta, and hard frost may have ruptured the rocks in the same manner as at Gibraltar." By what process of reasoning are we to account for the immense transition from a winter of Arctic severity to one more than twenty degrees above the freezing point? Our author does not believe that elevation or depression of the land had much to do with these extreme alternations of climate. He would interpret the striking series of glacial phenomena observed by him and Professor Ramsay at the Rock, not as indicating a quondam Alpine distribution of mountain and valley like that of Switzerland or the Himalaya, with glaciers in the hollows, altogether independent of the temperature due to latitude, as well as of the climate prevalent to the north or south. His picture of Europe seems rather that of an extended Greenland, the northern ice-sheet spreading in an almost unbroken level to the confines of Africa. In the map appended to his work it is true the southern limit of the glaciated areas is drawn through the latitude of London and hardly lower than that of Dresden and Krakow, curving northwards along the Ural Mountains. But the phenomena of the true Ice age are in his view of a character wholly apart from the effects of mere mountain elevation, and for the causes which brought them about, and in turn led to their dissolution, we must look to wider and more exceptional agencies. The retreat of the great European ice-sheet was to all appearances neither rapid nor continuous. There are evidences of mild interglacial epochs during which the Pleistocene mammals above mentioned are shown by their remains to have had a wide existence. We have proofs, our author maintains, in the sections of Pleistocene river gravels and cave deposits of no fewer than four glacial periods in England, separated by intervening ages of mild climatic conditions, during which man was an occupant of English soil. That man had his habitation here before the advent of the first glacial epoch, and even made his footing in Europe in Pliocene times, is, he considers, far from improbable. That Palæolithic man, driven southwards by the extreme severity of the closing stage, once more made his way back to these latitudes is not so likely as that he was supplanted by the more advanced Neolithic man; who in turn, about the time when Britain was severed from the mainland, was followed by the race who brought with them the use of metals. That the men of the old and the new Stone periods may have struggled for a while in the South of France at a time when the glacial was still living in the valleys of the Pyrenees, has indeed been rendered likely by the researches of M. N. Quatrefages

and Hamy, but that a wide interval on the whole separates the Palæolithic from the Neolithic ages everywhere in Central and Northern Europe is one of the conclusions which Professor Geikie holds it one of the main results of his work to have made good.

With respect to the causes of these extreme alternations of climate our author sees no reason to add much to the views put forth in his *Great Ice Age* in general accord with the theory of Mr. Oroll. Subject to such modifications as have been suggested by Professor Boyd Dawkins, as well as to the standing protest of astronomers against tampering with the obliquity of the ecliptic, there is felt by geologists at large to be in these views a trustworthy basis for the calculation of the climatal and geographical changes involved. At the same time, nothing herein established need set aside the fundamental conclusions of Sir C. Lyell and the English school of geologists in general as to the sufficiency of changes in the distribution of land and sea to explain the vicissitudes of climates. It is through such changes that the effects of varying eccentricity would to a great extent make themselves felt, such as the vast augmentation of the polar ice cap, the consequent alteration of the sea level, and the increased intensity of the polar currents of water and air. Even now the arctic-sheet comes down as far as the extremity of Greenland, within a degree or so of the parallel of latitude at which the group of the British Isles begins, and the former region remains in consequence as yet under the Great Ice Age. With no great extension of the geographical causes to which this phenomenon is due, Scotland, and perhaps all England, might be once more wrapped in the Palæolithic glacial sheet. To the influx of the warm equatorial current or gulf-stream we have in all probability been indebted for our release from the bondage under which our first human representatives were frozen up, and judging from the present gradual shrinkage of the Alpine glaciers, it is to the same genial breath that Europe might within no extreme range of geological time owe its riddance of the last vestiges of the Great Ice Age, and witness the closing scene of the long struggle with nature first waged with the imperfect weapons of Palæolithic man.

FRENCH LITERATURE.

MANY Englishmen have had the courage to confess their indebtedness in point of historical knowledge to Shakespeare and Scott, and it may be suspected that a good many Frenchmen, if they spoke with equal frankness, would make similar acknowledgments in favour of Alexandre Dumas. Certainly the pages of *Le vicomte de Bragelonne* have supplied the ordinary reader with most of his ideas about the flirtation of Louis XIV. in the early days of his reign with Mazarin's niece. Nothing could exceed the horror with which trueborn Frenchmen, and, still more, trueborn Frenchwomen, viewed the King's fancy for "ces petites harençères de Rome," so long as it seemed not improbable that the matter might actually end in marriage. No doubt, first Olympe, and afterwards Marie Mancini, very nearly brought the susceptible Louis to this point; but neither succeeded. In this volume (1) M. Chantelaux gives the whole story from authentic documents, many of which have not yet been quoted, or have not been quoted fully. It is a story of considerable historical interest, for political issues of great moment were concerned, and of still greater interest of a personal kind. Marie Mancini was not beautiful, indeed she seems to have been positively ugly. But she must have had much of the charm which somehow belonged to all her family, and which made her sister Hortense the idol of everybody who had anything to do with her. She seems, too, like not a few others of his favourites, to have had a genuine affection for the King, whose unlimited belief in himself appears to have imposed on others far more than the cynical amiability of his cousin, Charles II. To her, too, appears to have been due in great part the taste for literature to which Louis afterwards owed so much. Thus she makes not an unworthy heroine for a volume which is a very fair specimen of its kind, fulness of historical information being accompanied by, but in no way sacrificed to, interesting presentation of the story from a literary point of view.

The work which M. Wallon has undertaken is beyond all doubt one of the most important contributions that have recently been made to the history (2) of the French Revolution. As he observes, the institution of the Revolutionary tribunal was "the great crime and the great blunder" of the popular party. By a curious accident, or, if it be preferred, by a just revolution of poetical justice, it has so happened that the tribunal has had very few friends. Its abominable procedure was directed by turns against the representatives of every party, and thus each party, in apologizing for its own idols, has perforce been obliged to expose the iniquity of the manner in which their doom was inflicted on them. The very occasion of the institution of the tribunal—the ill-success of Dumouriez in Belgium—gave a sinister indication of its probable conduct, and the failure of the Girondins to prevent its institution may be taken as the first definite sign of their approaching downfall. M. Wallon has given a most careful account of the successive exploits of the terrible Court, and the titles of his chapters—"Charlotte Corday," "Cousine," "Marie Antoinette," "Les Girondins," "Égalité," "Bailly"—indicate of themselves its

(1) *Louis XIV et Marie Mancini*. Par E. Chantelaux. Paris: Didier.

(2) *Histoire du tribunal révolutionnaire de Paris*. Par E. Wallon. Tomes 1, 2. Paris: Hachette.

author has prefixed to his work a preface which has evidently been carefully weighed, and which is likely to give not a little offence to the Extreme Left in France. We are told, the very least, that the terror is a thing of the past, not likely to return—"Et nous avons eu la Commune." Certainly a history fuller and more impartial than any previous one of the Revolutionary tribunal comes not inopportunistly at a moment when, both in France and in England, the Commune finds apologists and defenders, and when the intolerance of which the tribunal itself was only an audacious expression has been adopted as the order of the day by the French Government.

The work (3) of which M. Franck now publishes the second part—the first devoted to the middle ages and the Renaissance having already appeared—is one of those which may be called illustrations of history rather than directly historical works. The word "réformateurs" in the title perhaps gives an extension to the plan which the author has not, and indeed could not, have carried out in practice. To notice all the Reformers of Europe would take a library full of volumes. "Publicistes de l'Europe" by itself would perhaps have been a better appellation. It is needless to say that the special part of the subject contained in this volume is an exceptionally interesting one. At no time were the questions of political philosophy more eagerly theorized upon, or by more distinguished persons, than in the seventeenth century. M. Franck's volume has five "books." The first deals with what he calls the School of Resistance, including Suarez, Mariana, and Selden—a trinity of which the third member would perhaps hardly have cared to find himself associated with the others. Then comes a chapter devoted to the Utopists of the time—notably, Campanella and Harrington. The next section deals with Grotius and his followers, the promulgators of the law-of-nature theory. The fourth book, containing the opponents of this doctrine, again shows us how oddly systems of classification may work, Bossuet and Fénelon finding themselves side by side with Hobbes and Spinoza, while the excellent Filmer—a dwarf among the giants—also appears. Lastly, Leibnitz has a book to himself, though a short one. It was scarcely to be expected that M. Franck should be able to make a lively volume on such a subject, but he has made a solid one, and one which with its companions is likely to make a very useful compendium of the history of political philosophy.

In point of size, at least, the first rank among the numerous publications which the Jubilee of Belgian Independence has called forth may probably be assigned with safety to the history of the Belgian Parliament (4) during its fifty years of life. Five stout volumes, closely printed in double columns, and in one case extending to nearly a thousand pages, contain the *faits et gestes* of the Belgian legislators. The method adopted is that of sessional divisions, in each of which matters are arranged dictionary fashion. The book is therefore of the utmost convenience for reference, but not suited for continuous perusal. M. Hymans deserves much credit for the immense labour which such a work must have imposed on him.

An essay (5) on the relations of Alsace-Lorraine to Germany, reprinted from the *Revue des Deux Mondes*, is, as might be expected, strongly anti-German, but speaks very highly of Marshal Manteuffel.

We do not quite know whether the historians of the future are to be congratulated or condoled with on the immense mass of matter relating to the war of 1870 and its sequelæ which is being accumulated for them. M. Duret's work (6), the present volume of which deals with the Commune, appears to be itself carefully compiled, but shows no great narrative vigour, and lacks precision of detail.

Every one has heard of the Prix Montyon, or Monthyon, for there is a great controversy as to the proper method of spelling the name, but perhaps few Englishmen know much about the founder of these curiously French endowments. M. Fernand Labour (7) gives full information on the subject in a pleasant style. M. de Montyon was one of the many wise and good officers of State who redeem the *ancien régime* from the indiscriminate discredit thrown on it by ignorant persons. As Intendant at Aurillac he did even more than Turgot did at Limoges; and when the Revolution came, it was very much against his will that he was made an *émigré*. But he preserved a very large fortune; and it was with this that he founded his prizes, rather to the disgust of his tenants and dependants at Montyon. The good man, benevolent as he was, seems to have had a tolerably clear notion of the rights of property and a determination to exercise them.

Mme. Carla Sérénia (8) is going, it would seem, to make ten or twelve volumes out of her travels. These began in 1874, and seem to have lasted several years, chiefly in the countries of Russia and Turkey. We cannot say that the first volume promises very well for the other nine or ten. Mme. Sérénia occupies herself chiefly with telling us how very polite all kings, emperors,

staff officers, governors, &c., were to her; how they were astonished at her audacity in travelling, and so forth. This was certainly intensely interesting to her, but is less interesting to her readers.

The lectures and essays which M. Paul Bert has here reprinted (9) are full of scientific ardour and Republican zeal. We could have spared the (*vifs applaudissements*) which the learned professor has conscientiously reproduced, and we could also have spared much of his text. But M. Bert is an eloquent person enough, and the discourses to schools and colleges in which he encourages young France in the soundest doctrine of democracy and vivisection are models of their kind. Whether insults to the fallen and misrepresentation of everybody who does not agree with the speaker are good lessons for youth is a point on which we shall give no opinion.

M. Pillaut's *Instruments et musiciens* (10) is a pleasant collection of essays, partly on the different instruments which compose a modern orchestra, partly on a few composers.

There are several good books already about the *Précieuses* (11), but M. de Barthélemy's fairly deserves to be added to the list. His chief subject is "la Grande Mademoiselle" as she may perhaps be called, from this point of view, Mlle. de Soudéry herself, but many others of the society come in for notice.

A new edition of the *Roman comique* (12), and one of the prettiest we have seen, though Scarron's famous book has had its full share of reprints lately, has been added to the "ancient" series of M. Lemerre's *Petite bibliothèque littéraire*.

MM. Marmier and Soldi have given in their joint volume (13) a useful selection from the works of two of the most famous playwrights of Denmark, with good introductory memoirs. Oehlenschläger is represented by *Hakon Jarl*, *Axel and Valborg*, and *Correggio*; Holberg by *The Pouterer*, *The Busybody*, and *Ulysses*.

The December number of the *Revue des arts décoratifs* (14) is fuller than usual, and includes an interesting *compte rendu* of last year's Exposition de l'Union Centrale. The separate illustration of the number gives two candlesticks and a clock. One at least of the former is admirable.

M. Danewsky's pamphlet (15) is a counterblast to M. Martens's olive branch to Russia and England. M. Danewsky thinks that there can be no peace between "la politique humaine et loyale" of Russia and the terrible selfishness which characterizes the foreign, and especially the Eastern, policy of England.

The sixty-third volume of the *Bibliothèque utile* (16) is at least ambitious. M. Paul Boudois aims at giving a brief résumé of the principal facts of European history by nations from 1789 to the present day. In two hundred pages he has really achieved a remarkable instance of the literary compressed vegetable.

The railway guide is a characteristic product of the latter days, and, to do French publishers justice, nowhere has it been better done than in France. The maps and pictures of the Riviera given in the *Atlas du chemin de fer de Marseille à Gènes* (17) are of great excellence, and they are accompanied by letterpress which confines itself strictly to matters of fact.

L'Album des pensionnaires du Louvre (18), due to M. Louis Leroy as penman, and to M. Paul Renouard as pencilman, is a very amusing book. A certain brutality, inseparable apparently from French comic portraiture, may be charged against it. But laughter being, according to one of the greatest of psychologists, "a passion of sudden glory," brutality is perhaps inseparable from it.

We have to give account this month of some books of French verse—theory and practice both—which are unusually instructive. M. Théodore de Banville's *Petit traité de poésie française* (19) is, it need hardly be said, the best work extant on the subject. No one in eight hundred years has shown himself a greater master of the formal part of French poetry than the author of *Odes funambulesques*, and no one has shown himself better able to teach the art in so far as it is teachable. The book may be specially recommended to English readers, because there is a singular ignorance in England of the most ordinary rules of French prosody. Even the rule of the mute *e* is frequently violated by English amateurs. This and other solecisms cannot be better corrected than by a perusal of M. de Banville's pleasantly written and scholarly work. Nor would it be easy to find a better practical example of the excellences and the limitations of modern French poetry than in the republication which M. Lemerre has given of the selected works of Louis Bouilhet (20), accompanied, as it is, by the charming essay in which Gustave Flaubert—now, alas! gone to rejoin his friend in the ranks of the majority—introduced that friend's

remains ten years ago. The essay, among other things, shows the vast gulf which lay between the author of *La tentation de St. Antoine* and those who now falsely call themselves his pupils. The poems show the strength and the weakness of the school of poets who were the epigoni of the great romantic movement. Chronologically M. Bouilhet belonged to the intermediate set who—between the days of 1830 and the *Parnasse*—followed the banners of Victor Hugo, the set who will be represented in literary history by Baudelaire, by M. Leconte de Lisle, by M. Théodore de Banville, and, in a lesser degree, by M. Josephin Soulayr. He falls far short of the first three, and, unlike M. Soulayr, he was not fortunate enough to confine himself for the most part to one political field or allotment. His work is generally irreproachable in point of form, and from this point of view it compares very favourably with most English minor poetry. It is rarely trivial or wholly commonplace, but it somehow fails to justify itself by positive excellence. Of the more modern verse which the men of the present generation have produced, the two volumes (21, 22) now before us are very good examples. M. Nardin is one of the strictest sect of the *Parnassiens*, descending from Théophile Gautier through M. Théodore de Banville. M. Grandmougin has gone further afield for his models, and has something of Musset and the other guerillas of the romantic movement, as well as of the regular soldiers.

In *Le moulin Frappier* (23) Mme. Henry Gréville has had recourse to Normandy, the fertile mother of novels, and has written a book which is somewhat different in plan and style from any of hers that we remember. She has, however, been very successful. Considering the well-known adoration of Frenchmen and Frenchwomen for their mothers, it is rather curious that the worst side of the matronly character at a somewhat advanced age should be so frequently selected for exhibition by them in their novels. Mme. Victoire Beauquesne, the nagging mother-in-law in *Le moulin Frappier*, is one of the most detestable of those brawling women who make even a wide house uninhabitable, and the sordid character of the French peasant—a character respectfully suggested for consideration to those who hold him and his status up to the admiration and imitation of England—is capably shown both in her and in her husband. The volume which Mme. Gréville's chief rival (24) has just produced is not only slighter in texture, consisting only of three short stories, more or less connected by the similarity of theme indicated by their general title, but also weaker in style and of distinctly less literary value. The stories are, however, pleasant enough tales, as indeed, being the work of their author, they could hardly help being.

M. Burty has attained so high a reputation as an art critic that his venture (25) into another kind of literary work is at once perilous and interesting. The result is perhaps not very different from what might have been expected. The composition of the book is fairly good, it is excellently written, and there are detached passages of description which are capital; but, on the whole, we are afraid that M. Burty has not *la tête nouvelle* or *romancière*, whichever may be the proper phrase. *Pylade* (26) is a pleasant book of a style not too common in modern French fictitious literature, and recalling both by scene and manner rather M. Sandeau than any of his rivals. The hero is one of the few Frenchmen—are the Englishmen of the same stamp very numerous?—who thinks of others before he thinks of himself, and he is rewarded amply and satisfactorily. *La comtesse Mourenine* (27) tells us in its second title, *Une scandale russe*, pretty plainly what we must expect. It is M. Feuillet crossed with M. Cherbuliez, and we think that, on the whole, we prefer the originals. It is a curious subject for discussion whether English novels, as a rule, recall the works of living English masters so remarkably as French novels do. The moral of *Le baiser d'Odile* (28) is admirably enforced by the illustration on its cover. It is that it is not safe to indulge in effusive displays of illicit affection before an open window. Perhaps, however, this moral does not require the reading of a not very lively novel to enforce it. We ought to mention that one of the characters, the Abbé Moritz, is rather better than most of the personages of the average novel. M. Ulbach pursues, in *Le mariage de Pouschkins* (29), his task of *romaniement* applied to the novels of the Hungarian romancer Jokai. *La mort d'Eva* (30) is one of the funny books in which the manners of Anglo-Indians—always a subject of deep and intriguing interest to Frenchmen—are unveiled. Lord Sir Guy Richardson is a terrible Briton, who fights a duel on horseback with carbines, and drops his adversary with a silver bullet. In *Le roman d'une bourgeoise* (31), M. Guillemot endeavours to offer an amendment to the famous *Tue-la*, by suggesting, instead of execution, forgiveness after a sufficient probation. There is a good deal of art in the way in which—without playing fast and loose with morality—he makes his criminal's

crime as venial as possible. The three next books on our list are all specimens of the provincial novel. This used to choose its scenes in the West and North; now—perhaps under the influence of M. A. Daudet—it goes southwards for them. *Cœur de neige* (32) chooses Gascony, *Le berger du Béage* (33) the Vivarais, *Misé Féréal* (34) Provence. They are all fair specimens of their class. M. Louis Depret (35), the one Frenchman who has valiantly endeavoured to naturalize Charles Lamb in France, comes before us with a volume of humorous tales, which at least serve to show that he is endeavouring to live up to his ideal. Perhaps he has not quite succeeded, but the intention, if not everything, is at any rate something.

THE LAND LEAGUE.

IF it is true that tenants who had been coerced into dishonesty are beginning to pay their rents, and if the Land League is relaxing its hold on the fears and sympathies of the people, the change for the better is due to the prospect of improved legislation, and to the increased energy which the Government has displayed since the meeting of Parliament. Thus far the alarm professed by the obstructive members lest the arrest of DAVITT should precipitate an outbreak has not been justified by experience. It was alleged with a certain literal truth that the chief agitator had warned his followers against immediate insurrection; and it was consequently assumed as a reason for tolerating his seditious language, that on his withdrawal a check on popular violence would be removed. Even if DAVITT intended that his ostensible counsels should be followed, his only argument against revolt was founded on the probability that it would be unsuccessful. While he stimulated the passions of the populace to the utmost, he appealed, with perhaps greater effect, to their fears. The Government is not likely to be regarded as less formidable because it has used its powers to silence a dangerous demagogue. At the same time the disaffected Irish learned that the dreaded Protection Bill would not be much longer delayed. The ruffians who execute the lawless decrees of the Land League are probably thinking by this time of providing for their own safety before the Habeas Corpus is suspended in those districts which will be immediately proclaimed. Defaulting tenants perhaps foresee that no Land Bill will relieve them from their debts; and that even fixity of tenure will be conditional on the payment of a stipulated or arbitrated rent. Any improvement which may be discerned in the state of Ireland will tend to illustrate the truism that force is the only remedy for lawlessness.

In some cases labourers who had been forbidden by the Land League to work for their employers are beginning to feel the inevitable pressure of want. Their numbers will be swelled by others of the same class whom impoverished landowners have against their will been forced to dismiss. Agitators, lay and clerical, may perhaps for the moment persuade them that their interest is on the side of the mutinous occupiers. If any disturbance should unfortunately occur, the ranks of disorder will be largely recruited from the poorest section of the community; but in time the labourers will not be satisfied with an agrarian system which would dry up the source of wages. The Land League undoubtedly owes a portion of its temporary triumph to the one-sided extravagance of its fundamental doctrine. The small farmers might not have been so strongly tempted by offers of moderate rents, or even of security of tenure, as by the promises of Mr. PARNELL and Mr. DAVITT that landlords should be abolished. They may be slow to learn that their project is impracticable; but in the meantime it is true that the rights of landlords have been suspended; and the labourers will profit by an experimental illustration of the consequences to the landless population which may result from the approximately equal division of property. The working of the Encumbered Estates Acts had already thrown light on the comparative advantages in such a country as Ireland of large and small estates. Purchasers for investment have been unable rather than unwilling to extend to their tenants the indulgent laxity

to which they have been accustomed under great proprietors. Even Mr. BRIGHT's admirers allow that he was mistaken when he was tempted by his prejudices into the statement that the agrarian evils of Ireland are mainly to be attributed to the existence of large estates. The ten thousand landlords who are incessantly taunted by agitators and theorists with their numerical weakness may perhaps hereafter be regretted by the sub-lessees who may occupy land under middlemen created by fixity of tenure.

The Land Bill, whatever may be its provisions, will, in the first instance, be received by the agitators with real or simulated indignation; but the advocates of justice and of sound economic principles have more to fear from the extreme Liberals, including the less violent section of Home Rule members. If the Government had accepted the suggestion that the Land Bill should take precedence of the Protection Bill, the division of opinion would have been so profound and so inveterate that it might have been difficult to secure approximate unanimity in the legislation which is necessary for the restoration of order. The Parliamentary obstruction which was at last with difficulty checked, produced an opposite and beneficial effect. The spectacle of lawless turbulence in the House of Commons confirmed the belief that the same demagogues were engaged in the promotion of social anarchy. Proposals to modify the provisions of the Government Bill were received with little favour. The present Ministers cannot be suspected of excessive severity or vigour. It is but reasonable to assume that Mr. FORSTER has sufficient reasons for making the provisions of his Bill retrospective; and it is not desirable to provide for the impunity of malefactors who may happen not to have committed any known crime within the last few months. The proposal that a future judicial inquiry should determine the guilt or innocence of persons arrested under the Lord-Lieutenant's warrant is utterly inadmissible. The power of acting on well-founded belief in default of legal evidence is absolutely essential to the efficacy of a preventive measure. The lists of outrages which are published in a tabulated form in the Blue Books account for the universal prevalence of terror. If the fact were not otherwise, however, it might be taken for granted that the recipients of the threatening letters and the victims of nocturnal outrages would not venture to give evidence in public against the offenders, though in some instances they might be willing to furnish the police with a clue. It is true that the Government will be, in some degree, dependent on secret information; but the accuracy of statements made by injured persons will be, as far as possible, strictly tested. The conspirators who intimidate the peaceable portion of the community must bear the consequences of the silence which they have imposed on the sufferers.

The arguments for the Bill and the declamation against it had been so largely anticipated during the discussion of the past month, that the debate on the second reading of the Bill was devoid of novelty. The amendment which purported to defeat the Bill was appropriately moved by Mr. BRADLAUGH, though some votes may perhaps have been lost to the opponents of the measure by their remarkable selection of a leader. Those who sympathise with the rural tyrants of Ireland are consistent in refusing to interfere with their evil practices; but it was more than once pointed out during the course of the debate that the only part of

the public on the fact, that the declaration of that state has, owing to Sir STAFFORD NORRIS and his followers, been fenced and safeguarded by not a few regulations in the first instance.

There are, however, others of the rules which, if they follow with equal logic from the conversion of a Speaker into a Dictator, jar more harshly still on the reader, and exhibit still more fully the surrender of liberty which the House has made. Such is the provision that at any time when it seems good to the Speaker to put the question, he may do so forthwith, provided he obtains a three to one majority in that sense. Here there is no proviso as to the number of the House which may be present, nor any necessity for notice, nor any power of deliberation or delay. Again, it is provided that, if not more than twenty persons challenge the decision of the Speaker, that the ayes or noes, as the case may be, have it, the ceremony of a formal division may be omitted altogether. This amounts to an admission in the crudest possible form of the omnipotence of numbers. It does not necessarily follow that a minority is not worth attending to because it is numerically small, especially as in a very possible case the majority in whose favour the decision was given might be no larger. So, too, the rules intended for the guidance of the House during Committee may be divided into two classes, one of which is only objectionable in so far as it is the natural result and concomitant of urgency, while the other exhibits the unpleasant features of that state in a somewhat newer and more vivid light. It has already been pointed out by more than one critic of the rules that the restriction imposed on repeated speech in Committee would tend in practice to stifle many valuable suggestions, and that it indeed strikes at the root of the importance and use of Committee as an institution. But, on the whole, it is probably useless to comment in detail on the unpleasant features of these regulations which cannot be altered, which have been by implication accepted, and which merely translate into precise terms the power committed to the Speaker, and indeed exercised by him before it had been so committed. No exercise of autocracy here detailed exceeds in arbitrariness the silencing of the malcontents on the morning of Wednesday week, and perhaps few exceed in arbitrariness the summary interruption of Mr. DILLON the next day. In one way the stringency of these rules, supposing them likely to be adopted as a precedent, may have a good effect in making the House all the more unwilling to declare urgency in the first instance. But the die is cast; the example set. For the time the House of Commons has ceased to be a place of free discussion, and the opportunities enjoyed by its members of endeavouring to delay what they think unjust, or of endeavouring to bring round their fellow-members to what they think to be just, have been grievously curtailed. The Irish members have been copious with tongue and pen on the subject of the treatment they have brought down on themselves. They do not, however, seem to have observed that, while they have done the worst for the cause they profess to have at heart, they have done the utmost for that which they strenuously repudiate. They have disabled themselves from further serious opposition to the Coercion Bill; but they have succeeded in lowering the privileges of the House of Commons and in injuring its prestige. To some of them this may possibly be a consolation. Impartial critics may be perhaps allowed to regret more and more that Dr. PLAYFAIR's irresolution, or his obedience to the programme of his chiefs, prevented the Opposition from defeating at once obstruction and the closure.

THE SPEAKER'S RULES.

THESE are only two classes of persons who can be conceived as likely to read the SPEAKER'S new rules for the conduct of the business of the House of Commons with entire complacency. The first class consists of avowed enemies of Parliamentary government. The second consists of that much larger body of well-meaning, but somewhat shortsighted, people whose ideal of cookery is the method of HO-TI, who would gladly burn their house to roast their dinner, and who, provided the immediate object that they have at heart is attained, care little or nothing for the consequences. It is needless to say that no blame attaches to Mr. BRAND for the roughness of the gag which he has forged. He has been more or less deliberately commissioned to save Parliamentary society, and saviours of society must be allowed their platoons and their artillery, their Cayenne and their Lambessa. But any one who reads the rules and reflects a little on some of the occasions on which they might conceivably again come into operation may be allowed to indulge in a few wry faces. The first rule, extemporized a week ago, is open to little objection; and, generally speaking, the provisions having reference to the adjournment of the debate are necessary corollaries of the power summarily entrusted to the Speaker by the declaration of urgency. Perhaps the same may be said of the clearing away of all obstacles to going into Committee, to the consideration of Bills as amended, and the like. It is perfectly clear that in many cases the gag might act unfairly and prejudicially; but that matter must be supposed to have been contemplated in the admission of the state of urgency as such, and there is nothing left to do but to congratulate the House and

the public on the fact, that the declaration of that state has, owing to Sir STAFFORD NORRIS and his followers, been fenced and safeguarded by not a few regulations in the first instance.

There is one point of no small importance which has hitherto been but little noticed. There may be thought to be a reasonable fear lest the effect of the change should be to lower the character of successive Speakers. No one has any fear that, so long as Mr. BRAND holds the office, the vast powers which have been, and may again be, entrusted to him will not be exercised with judgment and with justice. In the first place, too, and so long as partisan Speakers are unknown, the possession by the Speaker, rather than by the momentary majority, of the power of the gag may be an advantage. But it is evident that this advantage would be turned into a disadvantage in the event of a Speaker being a partisan; and, what is more, it does not need a very great deal of consideration to show that the new system has a tendency to make the Speaker a partisan. Hitherto, though the idea of the Speaker being a special patron and protector of minorities

has hitherto been but little noticed. There may be thought to be a reasonable fear lest the effect of the change should be to lower the character of successive Speakers. No one has any fear that, so long as Mr. BRAND holds the office, the vast powers which have been, and may again be, entrusted to him will not be exercised with judgment and with justice. In the first place, too, and so long as partisan Speakers are unknown, the possession by the Speaker, rather than by the momentary majority, of the power of the gag may be an advantage. But it is evident that this advantage would be turned into a disadvantage in the event of a Speaker being a partisan; and, what is more, it does not need a very great deal of consideration to show that the new system has a tendency to make the Speaker a partisan. Hitherto, though the idea of the Speaker being a special patron and protector of minorities

and of individuals, was rather a pretty theory than an actual fact. It had considerable foundation in reality; just as on the rare occasions of using his casting vote he was supposed to resist innovation, so he was generally supposed to lean towards the side of precedent and of established right and privilege. He had but little opportunity of doing one party or another a service or an injury; his decision, except on points of order, could be challenged by the most insignificant minority which could muster tellers; and he was powerless to shorten or stifle debate. The new arrangement has changed all this. Though the limitations introduced by the leader of the Opposition have interposed difficulties in the way of the Speaker entering on his dictatorship, when he has once entered upon it there is hardly anything to control him, and the assistance which he can lend to the side which he favours is simply enormous. It has become, therefore, a point of vast importance to secure a probably favourable Speaker, and the election, instead of being, as it has for years been, half a matter of form, may be expected to be more and more keenly contested on purely party grounds. It is difficult to believe that this can present itself to any one as a desirable thing, or one to be contemplated without some dismay. Taken in conjunction with the most remarkable feature of the new and enlarged constituencies, their tendency to run *en masse* to alternate extremes, it is specially disquieting. In Parliaments composed of narrowly matched parties, a Speaker is pretty sure to be impartial, and his partiality would not do much harm. In Parliaments composed of a large majority and a comparatively small minority, the impartiality of the Speaker and the absence of any temptation inducing the majority to make sure of his assistance are things of vital importance. It may be repeated that, if the Parnellite party are as anxious to do mischief as they are sometimes represented to be, they certainly have attained their wish.

SOUTH AFRICA.

THERE may probably be some foundation for the rumour that Irish malcontents have aided in instigating the revolt in the Transvaal; but it is immaterial whether they have promoted an insurrection to which they could render no effective support. The contribution of Irish conspirators to an untoward occurrence must be confined to example, which was scarcely needed, and to the diversion of force caused by the necessity of preventing rebellion in Ireland. Common enmity naturally tends to alliance; but in proceedings which may be thought to resemble the operations of the Land League the Boers are not necessarily plagiarists, for similar causes produce in South Africa as in Ireland their natural results. A considerable part of the population of the Transvaal, including a minority of the Dutch farmers, is either well affected to the English Government, or opposed to the policy of armed resistance. The insurgents consequently practise the same methods by which the Land League promotes ostensible unanimity. The dissentients are threatened with death or expulsion if they decline to join the armed Boers. Some of the English settlers are tenants of the Dutch proprietors, occupying portions of their large estates. The condition of society so far differs from that of Ireland, that physical force, and the opportunity of applying it to purposes of coercion, are in the Transvaal on the side of the landowners. When the revolt began, parties of armed Boers visited the settlers whose disposition was either doubtful or adverse to their cause, and informed them that three parties, or loyalists, rebels, and neutrals, would no longer be tolerated in the country. They must accordingly either go to Pretoria, at that time the head-quarters of the English authorities, or attend the meetings at which the rebellion was organized. The inhabitants of English blood are not believed in any instance to have taken part in the insurrection; but the friendly and neutral Boers may probably have thought it prudent to join their countrymen. If the battle at Laing's Nek had resulted in a defeat of the insurgents, the dissensions in their ranks would probably have resulted in the secession of their unwilling confederates. One of the many evil consequences of defeat is the more thorough intimidation which the insurgents will be enabled to exercise. In one of his despatches Sir G. COLLEY tells the SECRETARY OF STATE that the loyal inhabitants are in so many ways

dependent on the Boers that they cannot be expected to oppose them. If the opportunity occurred, the English inhabitants would gladly seek protection against the harsh treatment to which they will probably be exposed.

Although the revolt would in any case not have been long postponed, there is some reason to believe that it was precipitated by casual and unfortunate occurrences. The first occasion of dispute was the refusal of some of the inhabitants, including members of the provisional Legislature, to pay taxes which were due. It was not until process was issued that armed resistance was offered; and in one case, at least, the officers of the Government appear to have made a mistake. A Boer, of whom 27*l.* was demanded, offered 14*l.*, which, as he contended, was the amount of his debt. A waggon belonging to him was taken in execution for the larger sum; and, when it appeared that his original tender had been correct, a dispute was raised about costs. The waggon was forcibly retained or recovered; and the first defiance of the law soon afterwards merged in systematic resistance. Sir OWEN LANTON argues at great length that the disinclination to pay taxes had begun not less conspicuous under the Republic. It is certain that Mr. BURGERS repeatedly remonstrated with his constituents and countrymen on their refusal to supply him with the means of discharging his duties as Governor. The inference appears to be that great allowance ought to have been made for unwilling subjects who had not been accustomed to pay obedience even to their own indigenous Government. As a general rule, it is the duty of official persons to enforce the law without regard to persons; but, immediately after so revolutionary an act as annexation, it would have been desirable to incline as far as possible to indulgence. Higher personages than the Administration of the Transvaal appear in the published correspondence to be deficient in the power of adapting themselves to circumstances. In the course of last November the German Ambassador requested Lord GRANVILLE to take measures for the protection of some German traders and missionaries, whose lives or properties were liable to be endangered by a war which had broken out between some natives in the neighbourhood of the Cape Colony. The Colonial Government had, in fact, no jurisdiction over the territory, and had determined not to interfere in the quarrel between the Damaras and Namaquas. The inability to interfere was bluntly stated as a conclusive reason for not complying with the request of the German Government. It would have been more judicious, especially in regard of possible complications, to undertake that English influence should be used as far as possible for the protection of German residents. In a much more important matter, tact and courtesy might perhaps have postponed the collision in the Transvaal. Mr. KAUFEN, who always professed a desire for a peaceable settlement, alleged that hostilities were forced upon his party by the rigid enforcement of the law.

The latest accounts from the seat of war are in no respect encouraging. The rainy weather which renders the roads almost impassable will soon pass away; but it is unsatisfactory to learn that the Boers had interrupted the communication between Durban and Newcastle; and also between Newcastle and the English camp. In the northern districts of Natal the Dutch settlers are numerous; and it is probable that some of them may have given information and assistance to the enemy. The account of the second action which has been fought is not a little alarming. Finding his communications with Newcastle interrupted, Sir G. COLLEY marched on the 8th of February southward to protect an expected convoy, leaving only an insignificant garrison of three hundred men to defend his camp. Being attacked on his march by a force of Boers, evidently much superior in number, he succeeded in holding a position which he had occupied; and in one account it is stated that he repelled the enemy with great slaughter. It is more certain that he was unable to penetrate to Newcastle, or to reach the convoy, and that he lost out of his little army one hundred and fifty men killed and wounded. The action has been absurdly described as a victory; and it is certain that two or three such victories would leave Natal open without defence to invasion. No explanation has yet been given of the rash attempt to force the pass at Laing's Nek. The garrisons in the interior of the Transvaal seem not to have been in urgent need of relief, as they are still holding out. The report that Lydenburg, with a portion of the unfortunate 94th Regiment, had been taken has been since contra-

dicted. It may be hoped that reinforcements have by this time arrived at the front; but the difficulty of the enterprise is rapidly increasing. It is said that the alternative road into the Transvaal through the territory of the Free State is fortified; and it is suspected that a part of the force with which Sir G. COLLEY was engaged on the 8th of February consisted of volunteers from the other side of the border. The approaching Session of the Volksraad in the Free State causes reasonable anxiety. Mr. BRAND, the President, has hitherto maintained neutrality, and there is no reason to doubt either his integrity or his friendly feeling to the English Government; but it is well known that many of his countrymen sympathize with the insurgents; and it is feared that, if they command a majority in the Legislature, they may force the Republic to join in the war. It was perhaps prudent to overlook as long as possible the irregularity which has apparently been committed of allowing the Boer troops which have lately been operating in Natal to pass through territory belonging to the Free State, though a similar permission accorded to the English troops might have obviated the disaster at Laing's Nek by supplying an easier mode of access to the Transvaal. The Government of the Free State is probably powerless to restrain the movements of the Boers, or to prevent the complicity of its own subjects. Too urgent a remonstrance would be likely to strengthen the party which is unfriendly to the English Government; but it may not long be practicable to affect ignorance of hostile acts. It is asserted that the insurgents have made overtures of alliance to some of the native chiefs; but, according to the same accounts, they are all loyal to the Government which, as they well know, is their most trustworthy protector. If the war continues, the border tribes will almost certainly profit by the absence of the Boers in the field to commit depredations on their cattle. It would not be difficult to enlist their services in the struggle, but the civil and military authorities rightly refuse to employ savages against Europeans. The Zulus, who formerly threatened the Transvaal, are now peaceably disposed under their numerous chiefs, and some of them are beginning to take service as labourers in Natal. If they should again be organized as a military Power, the Boers may have reason to regret that they have alienated the goodwill of the English Government. Much anxiety is felt as to the disposition of the Dutch colonists at the Cape; but only agitators and alarmists predict a general conflict between the two races for the sovereignty of South Africa. Although the Dutch, including settlers of French and German descent, form a majority of the population, political preponderance seems to be on the side of the more active English population. The present Ministry, which still retains a Parliamentary majority, represents the English rather than the Dutch element; and the war against the Basutos which now approaches a successful termination is mainly conducted by English levies. The burgher force which lately took the opportunity of retiring from the army in the middle of a battle will not have acquired a claim to colonial gratitude or confidence. There is reason to suppose that the Ministers and the Parliamentary majority at the Cape have little sympathy with the Transvaal insurgents.

RUSSIA AND CANDAHAR.

THE Duke of ARGYLL is not a person whose expressions command universal assent, but few people are likely to quarrel with his statement of the effect likely to be produced by the publication of the documents discovered at Cabul. Perhaps the persons who have been most disquieted are those who had been confidently asserting that there was absolutely no cause for disquiet. The eggs of the Cabul mare's-nest have proved to be very authentic eggs, full of most curious meat. We were told before the exhibition of these documents to be careful about their dates, which would of themselves remove all anxiety; and we were told that Lord BEACONSFIELD had completely whitewashed Russia by some remarks in December, 1878. The chances of anticipatory comment in political matters are indeed sad. On the assumption of the accuracy of the documents as published, dates establish all, and more than all, the contentions of the party adverse to Russia, and they further show that, when Lord BEACONSFIELD spoke, he was in ignorance of the details of the transaction here disclosed. The Russian intrigue revealed in these docu-

ments was not, as has sometimes been claimed for it, an answer to the Mediterranean expedition from India. It was an answer to the Berlin Treaty. It was begun after the secret agreement between Lord SALISBURY and the Russian Envoy; that is to say, after peace was virtually assured. It was continued long after the definitive treaty was signed, and after official intimation of that signing had reached the Russian actors in the transaction. Nor was it confined to half-irresponsible satraps, doing what was right in their own eyes. Some of the letters were sent to Livadia, the palace of the Czar himself, who is represented as receiving them personally. We have no intention of indulging in any indignant comment upon this curious correspondence, which can only surprise novices in history and politics. But two things may certainly be said of it. The first is that, if any one after reading it fails to see that the unhappy war with Afghanistan was unavoidable, his courage and consistency as a party politician are worthy of all praise, which must, however, be paid him at the expense of his capacity for judging evidence. If any one after the perusal has the slightest faith in future understandings on the subject of Afghanistan, his generosity in the same way deserves credit at the expense of his discretion. It would be interesting to hear an authoritative explanation of the reasons which prevented the late Government from publishing these documents. Such abstinence out of mere chivalry would have been quixotic; it may have been statesmanlike if the object was to avoid reopening the just healed sore.

It is impossible that any practical person in reading these documents should not look to the future rather than to the past. Mere partisans may be delighted, and very excusably delighted, at the complete vindication of the Afghan war of which these letters are the *pièces justificatives*, or may sorrow and wonder over their suppression by the late Government before the general election. Such feelings are natural, but not wise. The justification of the past is a matter for historians rather than politicians, and he who thinks that the English nation in one of its periodic fits of political intoxication would pause and become sober if one spoke to it from the dead must have little experience and a superabundance of hope. But it is sufficiently obvious that the present affairs of that province of Turkestan which skirts the northern frontier of our troublesome neighbour are again being made the subject of understandings, tacit or overt, between Russia and Great Britain. With the reticence which is the chief characteristic, and apparently the main political weapon of the present Ministry, Lord HARTINGTON and Sir CHARLES DILKE, each in his capacity and manner, have hitherto avoided giving any explanation of the subject. The cavalry of General SKOBLEFF are daily approaching nearer, not merely to Merv, but to Herat. For a remarkable method of relieving English panic about the shadowy city on the Murghab has just been resorted to by some defenders of Russia. The English, they say, think that Merv is the key of India, but this is quite a mistake, for there is a much better way to Herat direct from Askabad. In other words, we need not trouble ourselves about the key, for the lock is picked already. The value and substantial accuracy of this encouraging argument are matters with which we do not propose to deal. But such arguments do not make one regard with any more complacency Lord HARTINGTON's stolid refusals to give the slightest account of the reasons which have led the Government to order the evacuation of Candahar, or Sir CHARLES DILKE's polite information that the Russians have given no undertaking not to proceed to Merv, but that the Government have reason to believe that they will not proceed there. Meanwhile, while the Government "have reason to believe," General SKOBLEFF marches, the Turkomans submit or retreat, and the invisible world of Russian diplomacy is displayed agreeably in General STOLIEFF's recommendation to the unhappy SHER ALI to "make peace openly and in secret prepare for war," and in General KAUFMANN's information to the same luckless prince that "the EMPEROR has caused the British Government to agree to the continuance of Afghan independence." This last sentence has a curious bearing on the affairs of the moment. How many Indian princes will believe that Russia has "caused Lord HARTINGTON to retire from Candahar"?

We are not of those who have taken up a dogmatic and irreconcilable attitude about the occupation of the

Southern capital. That question is a very complicated one; it depends on military, financial, and political considerations almost equally, and the experts who can speak with equal authority on all three are, to say the least, not numerous. The singular and stolid reticence which, as we have already observed, has characterized the attitude of the Government on the matter, their avowed neglect of the contrary opinions of the greatest military authorities without cause assigned, are the chief things which turn the balance against them. We are not ignorant that authorities of hardly less weight, though, we believe, fewer in number, approve the Government course. They say that Candahar is not a good place to occupy, supposing that some post of vantage is necessary; that it would be a perpetual provocation to the Afghans; that it would be a perpetual challenge to Russia. There is force in these remarks—much more force than in the financial argument which has of late found favour with the partisans of the Government. But it must be pointed out that time has been unkind to these opponents of the Candahar occupation. We believe we are justified in saying that their opinions were for the most part formed and enunciated before the events of the latter part of last summer; it is needless to say that they must necessarily have been formed before the capture of Geok Tepe. These two events cannot be left out of the calculation. It is idle to say that Geok Tepe was sure to fall some time or other. Perhaps at the present moment we may not inappropriately remark that, if England had been Russia, and if we had acted as Russia acted two years ago, it never probably would have fallen at all. But it has fallen, and the Russian scouts are far on the road to Herat. Again, it is idle to say that AYOUN's march was nothing wonderful, and that it was repulsed. It is a fact; it showed Afghanistan and India how easily the outworks of the latter country might be reached from the North; how an invader might anticipate our calculations and blind our organs of information; and, lastly, how such an invader might, under very unfavourable circumstances, be checked by the walls of Candahar. We do not say that, if it were possible to revert to the conditions of two or three years ago, when Afghanistan had not been first debauched by Russia, and then thrown into anarchy, or when the troops of the Transcaspian army lay defeated and demoralized in the cantonments of Tchikislar, or when a march from Herat to Candahar was still regarded as itself something arduous and unlikely, that the occupation would have been a wise thing or a desirable thing. We do not say positively that it is desirable now, because there may be alternatives; though we confess that as yet we have seen no alternative which seems on the whole preferable. But what we do say is, that the events of the last twelvemonth, following on those of the twelvemonth preceding, have altogether changed the situation; and that neither the Government nor any defender of the Government has yet vouchsafed to recognize the change. Most of the arguments against the retention of Candahar—and some of them, as we have admitted, are weighty—deal with the question as if it were still in the air, as if Russia were not on all but the last stage to Herat, as if agreements were likely to keep her back, as if Indian opinion as to the withdrawal from a country where so much Indian blood and treasure had been spent could be safely neglected. When we find these points seriously dealt with, and the opinion of Lord NAMIER and of General ROBERTS and of others fairly weighed, the question may be re-opened. Perhaps the promised debate in the Lords may see for the first time some evidence of consciousness on the part of the Duke of ARGYLL and his colleague that a reiterated panegyric of the wise, statesman-like, and far-seeing policy of 1873 is scarcely a sufficient vindication of the policy of 1881. Hitherto the opponents of the retention of Candahar seem to us for the most part to be dealing with ancient history.

DIVORCE IN FRANCE.

THE question of divorce seems to be an exception to the general unanimity of the Republican party in France. After all, M. SARDOU is not so far behind his generation as has been supposed. A dramatist may be forgiven if he declines to rush in where M. BRISSON fears to tread. That the Moderate Left should be opposed to divorce is natural enough, nor is it necessary, in order to

account for it, to suspect them of any lurking kindness for Catholicism. Even an advanced Atheist is not forbidden to take actual facts into consideration, and among the actual facts that bear upon this question an important place must be given to ecclesiastical statistics. France is still for many purposes a Catholic country, and divorce in a Catholic country is a very different thing from divorce in a Protestant country. There is considerable practical inconvenience in a marriage law which brings the provisions of the Civil Code into direct conflict with the religious convictions of the majority of the population. The introduction of divorce into France would undoubtedly have this result. The Roman Catholic Church holds marriage to be absolutely indissoluble; the husband or wife who intermarries with a third person during the lifetime of the other to be living in adultery, and the offspring of the second marriage to be illegitimate. It is easy to see what an occasion for strife would thus be given in every community sufficiently small to make the doings of individuals a matter of public concern. When a man or woman obtained a divorce and married again, one-half at least of their neighbours would refuse to hold any further intercourse with them. Such a state of things as this would not tend to the promotion of peace and goodwill among the inhabitants, nor would it reflect any credit on the Republican Government that they had been instrumental in getting divorce made legal. The case of a Protestant country affords no real parallel to this. In England, for example, though the Divorce Act was strenuously resisted, it was not unpopular with the great body of the nation. The clergy of the Established Church were divided on the question, and the mass of the laity were more or less in favour of the change. More than this, the idea of divorce had been made familiar by a long succession of private Acts of Parliament, and the change was very commonly regarded as nothing more than the simplification and cheapening of a recognized procedure. If the religious difficulty had been likely to be at all generally felt, it is probable that no English politician of any weight would have proposed to make divorce legal. In France the religious difficulty would be very generally felt. Every Roman Catholic must be opposed to the recognition of divorce, and a majority of the French people are still Roman Catholics. The recognition of this fact as exercising a decisive influence on the reception to be given to a Divorce Bill implies no opinion on the merits of the question. A man may have the firmest conviction that facility of divorce promotes the happiness of mankind, and yet shrink from introducing it into a country in which this facility is commonly called by another and harsher name.

The fact that the Advanced Left, equally with the Moderate Left, is of two minds upon this subject seems to need further explanation. Among this section of Frenchmen such commonplace and business-like considerations as those which have been mentioned do not usually meet with much attention. That a particular measure will irritate Catholic feeling is held, for the most part, to be no obstacle to its adoption. The *Times*' Correspondent suggests one reason why some members of the Advanced Left should hesitate before voting for the Divorce Bill, and M. BRISSON suggests another. The *Times*' Correspondent finds the explanation in the unpopularity in which their support of such a Bill would be likely to involve them. Divorce, he says, is immensely disliked by women, because, "however fenced round with precautions, it will 'always seem to them a DAMOCLES' sword.'" Upon a question of this kind women in France have still considerable influence. The electors like to be on good terms with their wives, and one easy way of remaining on good terms with them is to oppose measures which the wife dislikes while the husband has no special motive for liking them. There is separation enough on religious grounds between the French peasantry and their wives already, and for the husbands to widen the division still further by becoming partisans of divorce would be to court home discomfort for no adequate motive. The peasantry are not at all anxious to avail themselves of the liberty which M. NAQUET and M. LÉON RENAULT want to give them. Their advocacy of divorce would be purely speculative, and as such it is not likely to be maintained when it brings family discord with it. If this is the view taken by the peasantry, it will in many cases influence their votes. At all events, as between one Republican candidate and another, they will support the one who is hostile

to divorce rather than the one who is friendly to it. Consequently it behoves even the Extreme Left to be cautious how they commit themselves upon the question. Some of them may be certain of their constituents' support whatever line they take in the Chamber, and others may have ascertained that their constituents approve M. NAQUET'S Bill. But others again may feel a reasonable doubt which way their constituents will go, and in that case it will naturally occur to them that the satisfaction of passing a measure which will be very annoying to Catholics may be bought too dearly.

M. BRISSON'S objection to the Bill is of a more statesmanlike order, though here also considerations connected with party prospects are probably not far off. He rests his opposition in part on the difficulty of founding permanent political and social institutions in a country where a large portion of the population no longer recognizes the sanctions of religion, and the consequent importance of not abandoning any of those purely legal sanctions which to some extent fill the place which was once filled by religion. On this theory divorce is dangerous in France, not because the population is still largely Catholic, but because it has largely ceased to be Catholic. Even if it were largely Protestant, M. BRISSON would have no objection to allow divorce, because in that case the religious sentiment, though not altogether opposed to divorce, would be opposed to its undue extension. M. BRISSON is evidently afraid lest, when liberty of divorce has once been conceded, it should shortly be carried to extremes. Men and women to whom divorce is not forbidden, either by religion or law, will naturally be led to ask why it should be subjected to any restraints whatever. If marriage is nothing more than a contract, why should it not be dissoluble at the pleasure of the parties? M. NAQUET'S Bill proposed to make marriage dissoluble by consent, but it surrounded this permission with several conditions, avowedly designed to make the use of it irksome and consequently rare. But when once the permission had been given, it would be a very proper matter of inquiry why the use of it should be thus hampered. When a similar question has been asked at other times and in other countries, no good answer has been found to it. Divorce has been made easier and easier, the notion of any special sanctity attaching to the marriage contract has disappeared, and the relationship has tended to become less and less distinguishable from that of concubinage. M. BRISSON probably thinks that the growth of such a state of things as this in France would not tend to the happiness of the nation. But he may also think, and think with very good reason, that it would not tend to the permanence of Republican institutions. Forms of government are sometimes unfairly credited with the evils that have grown under their shelter. In the nature of things there is no special reason why lax views of marriage should not be just as prevalent under a monarchy as they are under a republic; but if they are re-introduced into Western Europe at the instance of a Republican Government, it is Republican institutions that will have to bear the blame. Social license is, after all, the luxury of a few, and when it is once traced rightly or wrongly to a particular form of government, the day in which that form will be upset is probably not far distant. From this point of view M. BRISSON'S opposition to divorce is perfectly consistent. He has no wish to give any occasion to the enemies of the Republic to blaspheme, particularly when their blasphemy might take the practical and unpleasant shape of a successful counter-revolution.

The extent to which the Chamber of Deputies halts between two opinions is shown by the divisions taken on successive days. On Monday it decided by 254 votes to 211 to go into Committee upon M. NAQUET'S Bill. On Tuesday it rejected by 247 to 215 the clause repealing the law at present in force. The majority on this latter day included 109 Republicans. The question now stands over for the Session, which in this case means that it will have to be dealt with by the next Chamber. This will now be the fate of every proposal as to the popularity of which the least doubt is felt. The Deputies are keenly alive to the peculiarity of the conditions under which they were elected, and to the consequent uncertainty how far they represent the views of their constituents upon questions which were not in issue in 1877.

TUNIS.

TUNIS has recently been the scene of events which it was feared might lead to some conflict of interests or authority between England and France. KHEREDINE PASHA, who left Tunis to figure for a time as Grand Vizier at Constantinople, was the owner of estates at a place named Eufida, about fifty miles south of the city of Tunis. These estates had been given him by the Bey, and before he left he parted with them to a French Company established at Tunis, and known as the Société Marseillaise. The right of the new purchasers to take possession was, however, contested by an English subject of the name of LEVY, who also had estates at Eufida, and whose estates were contiguous to those of KHEREDINE PASHA. By the Mahometan law the owner of adjacent property has a right of pre-emption, and it was this right which Mr. LEVY claimed to exercise. The French Society had, however, as it is alleged, adopted a precaution by which the right of pre-emption was rendered nugatory. A tiny strip of land on the border of Mr. LEVY'S estate had been excepted from the transfer, so that Mr. LEVY'S land did not actually touch the land transferred. Whether, under Mahometan law, this device would effectually bar the right of pre-emption is a question which cannot be answered except by Mahometan lawyers. But, if it were held to bar the right, there would be nothing to surprise those who have had any practical acquaintance with the working of Mahometan land laws. These laws are seen to introduce in many directions rights which it is found very difficult to adjust practically; and the ingenuity of Mahometan lawyers has been devoted to the discovery of devices by which the law, which is too sacred to alter, has been made inoperative. Theoretically, there is no reason why there should be a right of pre-emption; but, if there is such a right, there is no reason why a device for barring the right should not hold good, although it belongs to as infantine a conception of law as the right itself. Mr. LEVY, however, was advised that his proper course was to take possession of the land after a tender of the purchase-money, so that he might occupy the advantageous position of defendant, and only be turned out if the device of excepting the strip of land was held to be good. The French Company was equally alive to the advantages of possession, and equally resolved to be the first to assert its rights. But Mr. LEVY got the start, and when the agents of the French Company arrived on the spot, they found that the cattle and servants of Mr. LEVY were already established on the estate of KHEREDINE. The local authorities would not interfere to turn out the representatives of Mr. LEVY, and therefore the French Company called to its aid a band of Algerian Arabs whom it keeps in its pay, and finally took possession. Mr. LEVY appealed to the French Consul, and was informed that the estate was now French property, and that he should uphold the rights of French citizens. Mr. LEVY then determined to appeal to his own Government, and left for England, to lay his grievances before Lord GRANVILLE.

This is the outline of the story; but the French Company insists that there was more behind. They say that the present PRIME MINISTER of the Bey, and one or two of his associates, were at the bottom of all the opposition to them. They had hoped that the Bey would confiscate, according to the usual custom of the country, the estates of a fallen Minister, and give them to his new favourites. When they found that simple confiscation had been rendered impossible by the transfer to Frenchmen, they made use of Mr. LEVY and his rights of pre-emption. Every impediment was, it is said, put in the way of the Company. The Government officials took the transfer dues tendered by Mr. LEVY at once, but were not equally prompt in accepting those tendered by the Company. Mr. LEVY and his legal advisers got the start of his opponents because the gates of Tunis, which were open to him, were shut to them. When the agents of the Company arrived at the estate, they found that the cattle placed there to signify the possession of Mr. LEVY were really the cattle of the PRIME MINISTER and his friends, and the local authorities failed to act simply because they were afraid to thwart persons so highly placed. The Bey has lately shown signs of a disposition to emancipate himself from French control; or, as the French would say, to slip out of his position as a petty chief protected by France, which he is well aware is the position he ought

property to hold. He has shown himself far too friendly to Italy and the Italians, and has seemed prepared to play off his new friends against his old. The French Consul saw in the opposition to the Marseilles Company a new and dangerous sign of this tendency. It was really, as he chose to consider it, not a question between a French Company and an individual who happened to be an Englishman, but a question between France and the present advisers of the Bey. He had to deal with what he pictured to himself as a sort of rebellion, and he was lifted to a height above all ordinary legal rules. He sanctioned by his presence the employment of a band of foreigners—for in Tunis Algerian Arabs are merely foreigners—to take by force what the local authorities would not give, and he calmly informed an English subject who thought himself aggrieved that he, the French Consul, had settled everything, that the estate was now French property, and was therefore placed altogether beyond the jurisdiction of the local authorities.

This adventurous Consul was technically so entirely in the wrong that it was impossible his Government should uphold him when what had taken place was calmly discussed at London and Paris. Whether, if Mr. LEVY had been an Italian, there would have been much calmness in the discussion of his case at Paris may be doubted; but France has not the slightest wish to quarrel with England, and would never think of quarrelling on a point where reason was so manifestly against her. The French, however, were as much excited about the wrongs of the French Company, and the audacious resistance of the Bey to the French protectorate, as in their present mood they can be about anything that may take place outside the boundaries of France. To fall in with the popular humour, the French Government ordered two men-of-war to leave Toulon, and go to Tunis. On hearing this Lord GRANVILLE very properly ordered two English men-of-war to go to Tunis as a counter-demonstration. The legal rights of English subjects in foreign countries cannot be suffered to be at the discretion of French captains. But a very slight interchange of ideas sufficed to bring about a complete understanding. The French vessels were recalled to Toulon; the English vessels were told that they need not call at Tunis; and the two Governments agreed that a point of local law must be left to the local tribunals. The French Government had really no choice. It could not adopt as its own the line taken by its Consul. When French private persons and English private persons residing in a Mohammedan country quarrel as to a point of Mohammedan law their claims must be left to the judgment of the tribunals of the country to which they have chosen to go. The French Protectorate of Tunis is really a pleasant fiction. It is something that does not exist, but which the French wish should exist. It has never been brought to the notice of any European Power as existing; and Lord GRANVILLE had nothing to do with it. But, even if it did exist, the French would not be entitled to say that a question of local law should not be referred to the local tribunals while they remain the only tribunals that can take cognizance of such matters. The French Government could not take up a position which was demonstrably wrong, and this time it had to deal with England. But it is obvious that the French will soon find some better pretext for asserting what they conceive to be the rights of the protectorate they desire to set up, and that they will take care that their foreign opponents are not Englishmen, but Italians. Every month the relations of France and Italy in Tunis become more strained, and it is at the expense and to the humiliation of Italy that a French protectorate will be established if it is established. The commerce of Tunis is much more with Italy than with France, and, if the territory of Tunis borders on Algeria, the city of Tunis faces the neighbouring shores of Sicily. A joint protectorate like that of France and England in Egypt is out of the question, as France, which is ready enough to be on an equality with England, would never consent to be on an equality with Italy. That France at the first opportunity will assume a protectorate over Tunis is as certain as anything can be in foreign politics, and the English Ministry which may happen to be unfortunate enough to have to decide between acquiescing in the self-assertion of France and the defence of the legitimate claims of Italy will have a painful and difficult task.

THE GREEK DIFFICULTY.

TWO or three days ago Mr. COUMOUNDOUROS assured the Greek Chamber that the army, including the reserve, consisted of 74,000 men ready for war, and that the Government would not accept any compromise restricting the rights acknowledged by the Treaty of Berlin. If these statements at Athens are to be accepted as literally true, the contemporaneous negotiations at Constantinople are destined to be abortive. The only possible ambiguity is in the reference to the Treaty which contemplated a cession of Turkish territory, and not to the Conference which two years later defined the exact frontier; but the Greek Government has always contended that the protocol appended to the Treaty was as liberal in its recognition of Greek claims as the report of the Conference. Some additional risk of war may arise from the present condition of Thessaly, where Greek brigands, who are perhaps indistinguishable from patriotic volunteers, have of late sometimes come into collision with Turkish detachments. It also appears that the Turkish authorities, anticipating their own early retirement from the province, are extorting taxes not yet due, and otherwise oppressing the population. Such statements are not without internal probability; and, on the other hand, they are not to be implicitly believed as long as they rest on Greek testimony. It is probable that the war party is promoting agitation in Thessaly for the purpose of producing collisions between the hostile parties. The condition of the inhabitants is probably in the meantime highly uncomfortable; but there is no doubt that most of them earnestly desire incorporation with the Greek kingdom. The local feeling in parts of Epirus is more doubtful, for the resistance of the Albanians to the Turkish Government has probably no relation to the claims of Greece. The tribes desire total or qualified independence; and, even if they were subdued or temporarily conciliated, they would be troublesome subjects to Greece. Their loyalty to the SULTAN might at any time be revived by the concession of their demands.

If the Turkish Government has, as the Ministers assert, 100,000 men in Thessaly and Epirus, it may set invasion at defiance. More trustworthy informants estimate the force at a third of the number; and even 35,000 men, occupying the strong places and acting on the defensive, would be a match for 60,000 inexperienced troops. In the correspondence which has lately been published by the French Government, the Turkish Ministers more than once announced that they would make no use of their superiority at sea; but that, having repelled the Greek attack, the Turkish army would march straight on Athens. OSMAN PASHA has acquired his reputation exclusively on the defence of a strong position; but he might be more willing to conduct an offensive campaign against Greek enomies than against Russian regular troops. In other communications the Turkish Ministers professed to entertain no doubt that the Albanians would, even without assistance, be able to defend their country against any force of which Greece could dispose. Little attention is to be paid to either of the two parties while, like Homeric heroes on the eve of a combat, they exchange menaces and boasts. In a single-handed war the Turks seem to have the better chance of success, at least as long as they defend themselves against invasion; but it is not certain that, if war breaks out, the Greeks may not find allies in the neighbouring States and provinces. There is some ground for the warning that it may not ultimately be for the interest of Greece to increase the power of Slavonic rivals at the expense of Turkey; but the immediate aggrandizement of the kingdom by adding to its territory an area equal to half of its present extent might be thought to overbalance many political inconveniences and dangers. Even if the aggrandizement of Servia and Bulgaria were injurious to Greece, it would be ruinous to Turkey.

The Ambassadors who are conducting the negotiation at Constantinople cannot attach implicit belief to the warlike declarations of the Greek Government. According to the latest rumours, they have now some hope of succeeding, although the Porte has not yet been induced to state the utmost limit of its voluntary concessions. It is arranged that, if a settlement is found possible, all the Ambassadors shall address identical reports to their respective Governments. The harmony which renders the opening of the negotiation possible appears not yet to amount to unanimity. It is not yet known whether Mr. GOSCHEN in his interviews with Prince BISMARCK and Baron HAYMERLE

arrived at a distinct understanding as to the policy of the three Governments. It was remarked that he made no stay at Paris, probably because the French Ministry has deliberately refused to aid in enforcing the Greek claims. Rome would have been far out of his way, and in all recent negotiations England and Italy have acted together. Prince BISMARCK perhaps referred to Greece in a late public declaration that there was no danger of any war in which Germany would be engaged. Austria and Germany are still so closely united that Mr. GOSCHEN had little to learn at Vienna in addition to the information which he may have acquired at Berlin. It would seem that the close understanding which existed between France and Germany has lately been relaxed, probably in anticipation of M. GAMBETTA's approaching accession to office. England, at the same time, has become less able than formerly to co-operate with France, because Mr. GLADSTONE and Lord GRANVILLE retain the Greek sympathies which are renounced by M. BARTHÉLEMY ST.-HILAIRE. It is a secret whether Austria and Germany are disposed in any degree to assume the championship which is repudiated by France. It is supposed that the English Government must have withdrawn the opinion that the Powers ought to insist on the execution of the decree of the Berlin Conference. As it is known that Turkey will not submit to the terms, except under compulsion, the negotiation at Constantinople must be directed to some other object.

Though the concert of Europe is still nominally maintained, the Turks fully understand that, while some of the Powers object to coercion, the remaining Governments will not act alone. It is practically understood that the decision of the Berlin Conference will be so far modified that Janina is to remain under Turkish sovereignty; on the other hand, the possession of Larissa is thought indispensable to the occupation of Thessaly by Greece, and the main diplomatic contest is likely to turn on Metsovo. There can be no doubt that it would be better for Greece to obtain Thessaly and the rest of Epirus without risk or expense than to fight for the acquisition of two places, however important. The hesitation of the English Government in assenting to a modification of the frontier as defined by the Conference has probably been founded on the belief that any change would invalidate the title, such as it is, on which Greece relies. There is no doubt that all the Powers understood the last Berlin settlement to be final, although France has since explained that the decision was inoperative, and although some at least of the other Powers are not prepared to enforce it. As long as the English Government could hold its allies to their own admission, it was perhaps judicious to insist on full compliance with the terms of the award. It may be added that, in advocating the claims of Greece, England was consulting the best interests of the population of the disputed territory; and that even Turkey would suffer no injury, except perhaps in the doubtful case of Janina. The concert of Europe which was to effect these legitimate objects was also in itself desirable. It is now time to recognize the impracticability of entire success.

If it should happily be found possible to settle the Greek question without war, the English Government will do well to suspend for a time its activity in the East. Montenegro has been aggrandized in accordance with the provisions of the Berlin Treaty, and mainly by the efforts of England. Any advantage which Greece may obtain will be largely due to the same agency. M. DE FREYCINET a few months ago expressed his confidence that the beneficent activity of England would next extend to the remedy of maladministration in Armenia. It is highly expedient that Asiatic as well as European provinces should be relieved from oppression; but it is not so clear why the whole burden of redressing abuses should devolve upon England. Mr. GLADSTONE some years ago imposed upon himself another *trinoda necessitas*, not of diplomacy or of war, but of domestic legislation. He accomplished two of the objects which he had proposed to himself, but the third branch of the upas-tree proved to be too hard for amputation. In the same manner, he may perhaps find Armenia more difficult to deal with than Montenegro or Greece; and it is evident that in the regeneration of Asia he can obtain no support from the European concert. It is not at present necessary to dwell on the objections to exclusive co-operation with Russia. It was never a part of the policy of the present Government to enforce the execution of the Treaty of Berlin on any other State but

Turkey. The influence of England is consequently at its lowest point at Constantinople; and there is little probability that the SULTAN or his Ministers will listen to benevolent advice. If the pending negotiation fails, and if war consequently breaks out, it will be impossible to attempt for the present any other diplomatic operation at Constantinople. If, on the other hand, the SULTAN should prove unusually pliable, he will probably resist more obstinately the next demand which may be preferred.

THE ARMY ESTIMATES.

THE Army Estimates are never very pleasant reading. It is not that we pay a great deal of money every year, and that these Estimates are the "little account" which reminds us that the time for payment has again come round—that, if we get value for our money, ought to be no annoyance to a great and wealthy nation. It is not that the amount of protection we obtain against dangers, real or imaginary, is very small—that, if the cost were small in proportion, might be due to a deliberate conviction that it was best to husband our resources, except in the immediate presence of an unmistakable demand on them. It is that the method we adopt gives us the faulty part of both these alternatives. We spend a great deal and we get very little for it. Put them how we will, the figures which bring this conclusion home to us cannot be satisfactory. We have an army which is neither large enough to make up by its numbers for want of readiness for immediate service, nor perfect enough in its preparation and equipments to make up for its want of numbers by the promptitude with which it can be sent to any part of the world. For this army we pay not perhaps enough money to get a better one, but certainly almost enough money to get a better one. The premium is sufficiently high to make a very serious item in the national balance-sheet; yet the policy in consideration of which it is paid does not insure us against danger abroad nor against anxiety at home. To put it plainly, what is wanting is our old friend the pennyworth of tar. With that the ship would be all right; without it it is, if not spoiled, at least in danger of being seriously injured on some of its many little voyages.

The figures in the Estimates for 1881-2 are in one respect satisfactory. They provide for an increase in the infantry of the line of 2,792 non-commissioned officers and men. By this means Mr. CHILDERS proposes to give us twelve battalions with a strength of 950 rank and file each; four with a strength of 850, four with a strength of 650, eight with a strength of 500, and forty-three with a strength of 480, rank and file. It is to be hoped, though it does not appear from the Estimates, that these figures imply a regular progress from the lower strength to the higher—that whenever any of the first twelve battalions is sent on foreign service, one of the next four will step into its place, and immediately be raised to its maximum strength; that the place thus vacated in the next four will be filled up in the same way from the four that stand third in order; and that in this way the battalions first on the roster for foreign service will never be allowed to drop below their full strength. The country has had enough of calls made for instant help in a sudden emergency, and responded to three weeks after date. A battalion ought not to embark for the seat of war with half its strength made up of volunteers from other regiments, so that the officers have to go into action neither knowing their men nor being known by them. If the addition to the infantry of 2,792 men can enable Mr. CHILDERS to prevent this from happening again, the increase in the pay will be willingly borne. Unfortunately the gain to which we may look forward under this head is not without its compensating loss. The Government seem to have had two objects in view in preparing the Estimates—greater efficiency as regards the infantry regiments, and an outlay as nearly as possible the same as last year. As the net increase is only 119,200*l.*, they may be said to have come within measurable distance of this result. In order to achieve this, however, the strength of the army has had to be lessened in other respects. A real addition of 2,792 men is more than the English nation could contemplate without being unduly lifted up, and to prevent this the artillery and the cavalry have both been reduced in strength. If the only choice given to us were between an increase of 2,792 men in the infantry, with a

decrease of 569 men in the artillery and 549 men in the cavalry, and the retention of all arms at their present strength, it might, for anything we know, be right to prefer the former. That is a point upon which only experts can have an opinion. But even civilians may feel that there is not the slightest need to limit our choice in this way. The only ground upon which a decrease in the strength of the artillery and the cavalry can possibly be justified is a positive excess in the supply over the demand. The need of saving on one item in order to balance increased outlay on another is purely imaginary. England can afford to have as many soldiers as she needs of all arms, not merely of one arm out of three. Mr. CHILDERS may of course be able to show that our present establishment of artillery and cavalry is larger than necessary. But he will have antecedent probability against him, and, we fancy, military opinion also. The comparative strength of the different arms of the service ought to be determined in part by the comparative difficulty of increasing their strength at short notice. In this respect the artillery and the cavalry stand on a very different footing from the infantry. A recruit can be made of some value as a foot soldier long before he can be made of any use at all either as an artilleryman or as a trooper. The English army has been generally supposed to be unduly weak in both these respects. It is certainly unfortunate that Mr. CHILDERS should have found himself compelled to make our condition a little worse in respect of artillery and cavalry as the only means open to him of making it a little better as regards infantry. This, we may presume, is the price the country pays for having a great financier at the head of affairs. An increase of 119,200*l.* on the army is the largest sum which has been found consistent with the symmetry of Mr. GLADSTONE's next Budget. Perhaps, indeed, we ought to be thankful that Mr. GLADSTONE allowed the difference between the Estimates this year and last to appear in the increase column at all.

There is one other vote that calls for notice, not for any particular change that it has undergone, but merely because of the tale of disappointed hopes which it uniformly tells. Year after year we look for the Reserve which was in some sort to put the English military system on a level with the military systems of Continental nations, and year after year the object looked for is so infinitesimally minute that it almost escapes observation. In the Estimates for 1880-1 the number of men provided for in the First-class Reserve was 23,000. In the Estimates for 1881-2 the number of men provided for in the First-class Reserve is 24,000. Even this latter magnificent figure does not quite come up to the idea which the advocates of short service did their best to get accepted. Putting aside the defence of India and the Colonies, the short-service theory is a very sound one. What England wants is an army that is small in peace, but capable of great and immediate expansion in time of war. A long service cannot answer to this description, because it keeps a man with the colours all the time that he is really efficient. Consequently the army can only be increased in the event of war by the enlistment of new recruits, who cannot be made into good soldiers except after a considerable interval. The short-service principle is designed to meet this difficulty. It aims at passing as many men as possible through the military mill, and then dismissing them to civil life with proper securities that they can be recalled to the colours at short notice. In this way, at the approach of war, the army can be raised in a moment from its normal strength to a strength which shall include all the men who have served for a certain number of years back. This system has now been in operation since 1871, and the First-class Reserve consists in 1881 of just 24,000 men. Unless some better result than this is to be shown in future years, short service and Reserve must be set down as merely twin delusions.

THE JUDICIAL CHANGES.

THE debate on the Irish Protection Bill was interrupted on Thursday to give time for a discussion on the proposal to abolish the two legal Chiefships. On the same evening a motion was made by Lord DENMAN in the House of Lords for an address adverse to the proposal, but after a few words from the CHANCELLOR it was withdrawn. The Lords, therefore, declined to interfere with the proposal, and their refusal cannot fail to make a strong

impression on the public. The House of Lords contains many lawyers of the highest repute, and every Law Lord is, under modern arrangements, concerned in the habitual administration of justice. They know the profession to which they belonged during the most active time of their lives, the judicial body of which they form a part, and the needs of suitors with whom they are brought into contact. That no serious opposition should have been made by them to a considerable change is a strong testimony to the wisdom and necessity of the change. It was not in any way a party question. The change proceeded from Lord CAIRNS quite as much as from Lord SELBORNE, and although this made successful opposition hopeless, it made it easier for any one who disapproved of the change to say all he wished to say against it. In the Commons two Liberals supported an address against the proposal, and were countenanced by three Conservatives. The opponents of the change in the Lords appear to have been convinced beforehand of the hopelessness of opposition. A testimony of considerable strength is that of the Incorporated Law Society, which presented a petition expressing the general opinion of a large body of solicitors that in the interest of suitors the change was in the highest degree salutary, not to say indispensable. When the judges met in council, twenty-one out of twenty-eight were in favour of the proposal; and the only noteworthy demonstration against the change was that of a meeting of the Bar, from which nearly every Common Law barrister of eminence was absent, half of which did not vote at all, and in which those who did vote candidly confessed that they knew very little about the matter on which they were voting. In the Commons Sir HARDINGE GIFFARD afforded a solitary specimen of a barrister of eminence who was adverse to the proposal. In such a matter the public must look to the amount and quality both of the support and the opposition which a proposal receives as to the merits of which scarcely any one who is not a lawyer can pretend to have an opinion. Discussion and suspense are now at an end. Parliament has given its decided approval of the abolition of the Chiefships, and in a very few days two new *Justices* Judges will be appointed. But, as it is notorious that some persons whose opinions are entitled to respect have thought that the remodelling of the High Court would draw with it consequences disadvantageous to public interests, it is just as well that the change should have been supported by all the Law Lords, three-fourths of the judges in council, the general body of solicitors, and, with some exceptions, all the eminent barristers of the day.

The debate in the Commons, although chiefly supported by those who knew that they were arguing against a foregone conclusion, was not without interest. Mr. FOWLER recalled to the memory of his hearers that not many years ago most of the leading members of the present Government, including Mr. GLADSTONE himself, were strongly in favour of retaining the offices of Chief Baron and Chief Justice of the Common Pleas. With some Ministries, had they changed their opinions, the strongest reasons for the change might have been inferred. But as the debate proceeded, the actual reasons for their now supporting what they formerly opposed were revealed. When the new system of judicature was established, it was thought that the three divisions of the Common Law judges might be advantageously retained. If there were to be three divisions, there might very properly be three chiefs of division. In course of time experience showed that the retention of separate divisions hampered the administration of justice. Suitors were kept waiting until their division could take up their case, and when it did sit, the division thought it due to its dignity to come out in respectable strength and make an imposing figure before the public. Delay was thus caused in two ways. Suitors had to wait until their division could attend to them, and two or three judges were told off to do work of which one judge could have disposed. The first step towards a new state of things was taken when it was decided that a single judge should sit whenever possible, and a further step was taken when it was decided that divisions should be altogether abolished. The second step was a necessary consequence of the first, for it was impossible that a single judge should sit when the customs of divisions required that, as often as their special functions should be called into play, there should be two or three judges to do the work. It is so evident that the new judicature system cannot work unless the divisions of the Common Law

Bench are abolished, that those who wished that the Chiefships should be retained were obliged to admit that there could be no division in existence over which they might be invited to preside. Sir ALEXANDER COCKBURN was the man of greatest eminence who wished the Chiefships to be retained; but, then, he was also strongly in favour of retaining the divisions. Such a man could never rely on arguments in favour of which there was not much to say, and Sir ALEXANDER COCKBURN presented one mode of viewing the administration of justice with singular force. It was a mode of viewing the working of the law which was not only plausible in itself, but was countenanced by the long traditions of the country. According to this view, the test of excellence in a judicial system is not so much the despatch of business as the inculcation of a respect for the law. What is really important is, not that every suitor shall get a hearing, but that the fortunate few shall get such a hearing as will impress the public with a sense of the dignity, the ability, and the impartiality of English judges. Suitors, in fact, should be allowed to go only to one race a year, but then that race should be the Derby. In process of time business increased, suitors grew clamorous, and, what was more important, could make their voice heard in Parliament. The Legislature, impelled by public opinion, decided that the despatch of business should be the test of the goodness of the judicial system. Sir ALEXANDER COCKBURN fought hard for the old view, but the times were against him. Sir HENRY JAMES only embodied the new view when he said that the first thing to be considered was the interests of the public; and that those interests demanded that the interposition of divisions should not delay justice, although these divisions might give additional dignity to the office of a judge and additional liveliness to the favourable impression which judges make on the public.

Mr. FOWLER put, as well as they could have been put, the views of those who are obviously in favour of the single judge system and of the abolition of the divisions of the Common Law branch, but who would have liked to see the Chiefships retained as prizes for the Bar or as supports of the status of Puisne Judges. If special honour is in some way given to two judges who do exactly the same work as Puisne Judges, men of greater eminence would accept the position, and all the Puisne Judges would get a reflected glory from its being made evident that even Attorney-Generals would on certain terms be content to do the same work as their less fortunate brethren. The work of a Puisne Judge is in itself, it is argued, as arduous and as important as that of a Judge of Appeal, but it gets an undeserved discredit if there are a set of Appeal Judges over the Puisne Judges who are better paid, more highly honoured, and are thought by a misguided public to be wiser and cleverer. The way to stop this mischievous injustice is to give high pay and special titles to one or two judges, who will be in all other respects like Puisne Judges. What may be the titles given to these more illustrious Puisne Judges is in itself a matter of indifference, but as there happen to be two ancient titles, the memory of which still hangs about Westminster Hall, these old titles may as well be preserved, although, of course, with a new meaning. To be called a Chief Baron would not indicate that the bearer of the title was a chief or a baron, but would indicate that the person so called was an illustrious Puisne Judge. From this point of view it is not necessary to insist in any great degree on the Chiefships as prizes for the Bar. What with the Law Lords, the members of the Judicial Committee, and the Justices of Appeal, there are now so many great legal dignitaries that advocates of the highest eminence will always find something worth taking, if they wish to give up the Bar for the Bench. Attorney-Generals have plenty of places to attract them when they are tired of the House of Commons and of a lucrative practice. The question which agitates the minds of Mr. FOWLER and of those who think with him is not whether Law Officers will get sufficient promotion, but whether as good a class of Common Law barristers will accept puisne judgeships as at present, if they no longer have ex-Law Officers doing as they do and working as Judges of First Instance. This is the real point, the only point that has survived discussion in or out of Parliament. No one doubts that Chancery barristers, of equal eminence with those who are now judges, will continue to accept puisne judgeships as freely and contentedly as

ever; but then it is said that this is because they have never been used to the glory of having Chief Barons and Chief Justices of the Common Pleas associated with them. Common Law barristers, on the other hand, will feel that there is a sort of new blank in the life of a Puisne Judge, and will shrink from it. No one can prove that these anticipations are either right or wrong. Time alone must show. But it may be observed that both the present and the late CHANCELLOR, who must be as well acquainted with the inclinations of the Bar as any two men can be, have not the slightest apprehension of finding any new difficulty in persuading proper persons to become judges. Every one who is acquainted with eminent barristers will allow that a barrister who, after giving full weight to considerations of money, home interests, health, age, and intellectual tastes, would accept a puisne judgeship, but who would finally decline it because he has not a purely titular Chief Baron to keep him company, must be a man of a more curious and exquisite nature than is generally associated with success at the Bar.

THE STATIONERY OFFICE.

IT is really a pleasure in these days of self-assertion to find a public department in which the virtue of modesty has been consistently practised for nearly a century. The appearance of a First Report of the Controller of Her Majesty's Stationery Office naturally suggests that the office is one of recent creation. In that case a year or two of silence is neither unnatural nor infrequent. The chief and his subordinates have alike to learn their places, and before they can write about their work to any purpose they must know something of what they have to do. The reticence of the Stationery Office is of a nobler kind. It has been in existence for close upon a hundred years, and in all that time it has never used the material it distributes for the gratification of its own vanity. Though it can trace its origin to the Administrative Reform Act carried by Mr. BURKE, when Paymaster-General under the ROCKINGHAM Administration, it has not presumed on its birth. Even now it is not for its own gratification that it has come before the world. It is only "in accordance with the desire expressed" by the Lords Commissioners of Her Majesty's Treasury that Mr. PIGOTT has departed from the traditional reserve of his predecessors, and consented to lay before Parliament an account of the "establishment, duties, expenditure, and receipts of Her Majesty's Stationery Office."

It is possible, indeed, that the reserve displayed by this Office in times past was in part due to the consciousness that it was not very economically managed. The present Report enumerates quite enough savings to give the reader an idea of how differently things were managed before the appearance of that bright occidental star of economy, the late Mr. JOSEPH HUME. The old theory was that a Government should go about its business handsomely. It was the Government of the Sovereign, and all its acts ought to be characterized by a certain air of Royal magnificence. One example of this was the use for all Government purposes of the best hand-made paper. Blue-books were printed on it, and the whole correspondence of the public departments was written on it. When it is remembered that this correspondence included the invitations to supper interchanged by junior clerks, the most determined enemy of choeseparing will not regret that, "except for purposes of permanent and important records, the use of hand-made paper has been abolished." It took over ten years to conquer the practice of treating waste paper as an unrecognized perquisite of office-keepers and messengers. Since 1852 it has been regularly sold for the benefit of the public, and the receipts from this source now average 10,000*l.* a year. The contracts under which work was done for the Stationery Office were equally of a kind which was not likely to court revision. The savings effected since 1875 now amount to 55,000*l.* a year; "in other words, the cost for the work executed and supplies obtained through the Stationery Office would have cost at the rates in force before 1875 about 55,000*l.* more than would be paid for work and stores of the same quantity and quality under the contract now in force." This represents a considerable percentage on an annual expenditure of 460,000*l.*, which is about what the public have to pay for the printing, binding, and publishing of the books

and papers required for their use, and for the supply of writing materials to the public offices. Under the head of Printing the most costly item is also the least interesting. The forms required by the public offices are all supplied by the Stationery Office, and no office can fairly be charged with parsimony in the use of them. A correspondence with a public department always involves a vast expenditure of what, to the untutored outsider, seem to be forms without meaning. Nor is there any chance that this item will decrease. Good government and blank paper seem to go hand in hand. As we get rid of social and political abuses, we become more the slaves of routine. The one comfort that an economist can administer to himself is that money has been saved on the outward man of these forms. They are not nearly so magnificent as they used to be. The size and cost of the paper has been reduced, the use of coloured inks has been given up, and the monotony of the prospect is no longer relieved by strange and expensive varieties of type.

About 63,000*l.* are yearly paid for Parliamentary printing, including under this head the sums paid for printing papers presented to Parliament by HER MAJESTY'S command, and for printing votes, proceedings, and papers ordered by both Houses. There can be no doubt that a good deal of the matter printed under both these heads is little better than worthless. Mr. PIGOTT says that every member of the House of Commons "who served through the" last Parliament and drew all his papers, received, according to a moderate calculation, about a ton of printed "matter." The chances are that of all this heap of statistics and reports not a hundredth part was ever looked at either by the member or any one else. It is printed for no other apparent reason than to save the public offices the trouble of deciding what shall be printed and what kept back. As regards reports, whether from Select Committees or Royal Commissions, no retrenchment can be made. It is useless to appoint a Committee or a Commission unless its report is made public, useless, by printing the report and suppressing the evidence, to leave the world in doubt as to the soundness of the conclusions drawn in it. But there is a vast amount of purely statistical matter which would be all the better for judicious boiling down. The remarkable faculty which Mr. GIFFEN now brings to bear on the construction of a few isolated tables might be extended with great public benefit to the whole masses of figures which are chiefly valuable for their totals. It is not only on the score of saving money that a reform of this kind is desirable. It is even more so on the score of saving time. So long as Parliamentary papers remain what they are, many things of interest that lie hid in them will go altogether unnoticed. Except when a Blue-Book commands exceptional attention, it commonly gets none at all; and when it gets none at all, the end of its preparation and publication remains unfulfilled. Hopes of an improvement in this respect have latterly been held out, and it is time that something was done to give them definite shape. If the whole mass of papers were edited on a uniform plan, and some care taken in the choice of matter, the fifty or sixty folios which are now annually added to the shelves of the great public libraries might be brought down to a very much smaller number. The Reports of Inspectors, which form a constantly growing element in Parliamentary papers, might in many cases be merely searched for telling passages, instead of being printed in full, and officials of all kinds might be made to do a good deal in the way of suppressing their private opinions, and giving nothing but ascertained results. Of course there are cases in which an official opinion may be extremely valuable. But it should be the business of an editor to find this out. What is done without difficulty by a hundred private agencies may surely be done by one public agency.

The only other point that calls for notice in Mr. PIGOTT'S Report is his remarks upon "confidential printing." Under all the chief printing contracts the contractor stands bound to exclude all strangers from the printing-office, and to adopt every precaution suggested by the Controller to ensure that nothing printed for Government shall fall into hands not entitled to receive it. Besides, however, this general provision in favour of secrecy, there is some "confidential printing" which is separately charged for, and it is with the cost of this that Mr. PIGOTT is disposed to quarrel. Confidential work, if executed at the Foreign Office, costs about 27 per cent. more than confidential work

executed at another public office, and about 41 per cent. more than ordinary work executed on the printers' own premises. This is a large discrepancy, and it is not wonderful that Mr. PIGOTT burns to bridge it over. It is necessary, however, to bear in mind that there is very much more temptation to betray Foreign Office secrets than any others—except occasionally budget secrets—and consequently that very much greater care has to be exercised, in order to guard against betrayal. The sanction by which secrecy is ordinarily secured is simply the loss of the contract that will follow upon any failure to observe it. The contractor is in turn protected against incurring this loss by reason of any misconduct on the part of his workmen by their knowledge that, if they betray any secrets, they will at once be dismissed. But where Foreign Office secrets are concerned, something more than this is needed. Betrayal of confidence must not only be punished, but be made impossible, and this can only be done by the employment of picked workmen. Honesty, like all other useful qualities, has its price, and an economy which made its attainment doubtful would be a very certain loss.

MR. CARLYLE.

THE death of Mr. Carlyle will have caused, notwithstanding his advanced age, a widespread feeling of regret. Not only his friends, but those who knew him only by his writings, found themselves connected with him by a kind of personal association. Other men of genius put the best of themselves into their works, which thenceforth possess a detached and independent existence. Carlyle, though he was, in the opinion of many capable judges, the greatest writer of his time, always seemed to be a living teacher, or, as he has often been called, a prophet. His revelations were, like the chapters of the Koran, occasional and fragmentary, always characteristic and essentially consistent, but containing no body of systematic doctrine. He has inspired and modified the mode of thought rather than the opinions of one or two generations; but the imitators of his mannerism are not to be counted among his genuine disciples. More than one thoughtful essayist has within the last few days attempted, with more or less success, to define his theological and ethical convictions. They undoubtedly derived their form, and in some degree their substance, from the Calvinistic belief of his early youth; but it was not his habit or the tendency of his intellect to embody his creed in formal propositions. Though his conception of the moral order of the world may be called dynamic, unfriendly critics who accused him of deifying force were wholly mistaken. He was never tired of asserting the right of a hero to compel the obedience of ordinary men, but always on the condition that he was a hero, and not a vulgar despot. His own judgment in the selection of heroes was not infallible, but it excluded mere tyrants and usurpers. His contempt for the claim of license to do wrong blinded him in some degree to the advantages of liberty. His ruling principle is perhaps best expressed in the old formula *τὸ κρείττον ἐπὶ κρείττονι*, a phrase which cannot be at the same time literally and adequately translated into English, because the Greek word means at the same time better and stronger. Carlyle entertained little respect for the first Napoleon, who was the most perfect modern representative of material force. Napoleon III. in the height of his prosperity and power always appeared to Carlyle a vulgar charlatan. His admiration for Cromwell and, in a less degree, for Frederick the Great was but incidentally connected with a disposition to glorify success. In his estimation a martyr might be the equal of the best of conquerors. One of the most eloquent passages in his works is the imaginary description of the canonization of Edmund, the East Anglian King and martyr. "In this manner did the men of the Eastern Counties take up the slain body of their Edmund, where it lay cast forth in the village of Hoxne; seek out the covered head and reverently reunite the same. They embalmed him with myrrh and sweet spices, with love, pity, and all high and awful thoughts; consecrating him with a very storm of melodious, adoring admiration, and sun-dried showers of tears; joyfully, yet with awe (as all deep joy has something of the awful in it), commemorating his noble deeds and godlike walk and conversation while on Earth. Till, at length, the very Pope and Cardinals at Rome were forced to hear of it; and they, summing up as correctly as they well could, with *Advocatus Diaboli* pleadings and other forms of process, the general verdict of mankind, declared that he had in very fact led a hero's life in this world; and, being now gone, was gone, as they conceived, to God above and reaping his reward there. Such, they said, was the best judgment they could form of the case, and truly not a bad judgment." The apotheosis of the semi-mythical St. Edmund may be set off against some capricious eulogies of such despots as Frederick William I. and the Dictator Francia; and it may be admitted that Carlyle was not always superior to the temptation of paradox. His political sympathies became less and less revolutionary as he grew older. In *Sartor Resartus* there is a strong tendency to Communism, and in *Chartism* he still regards universal suffrage as a right, if not as an expedient arrangement. In later years he

often distrusted the judgment of the multitude, which, in his opinion, needed guidance and discipline much more than political power. His estimate of men was often extraordinarily sagacious, though the severity of his judgment was not unfrequently qualified by the influence of social relations. His dislike of Sir Robert Peel, whom he had ungraciously ridiculed as Sir Jabesh Windbag, was exchanged for sincere respect and esteem when he made his acquaintance in a house where they both were frequent guests. His feelings towards other statesmen of his time may probably have been affected by similar circumstances, for he was the most genial, though not the most tolerant, of men.

There are still many persons, not without literary cultivation, to whom Carlyle's manner is distasteful; and it may be admitted that he would in many cases have done better in adopting a pedestrian and ordinary style; but the habit of regarding all things from his own special point of view had become inveterate, and his language accurately represented his imagination and his humour. The Lowland Scotch, which was his mother-tongue, was the basis of his well-known diction. He borrowed some of his peculiarities from German, though the influence on his method of Jean Paul Richter, who was himself through one or two descents a follower of Sterne, has sometimes been exaggerated. Of Carlyle, if not of other writers, the saying is true, that the style is the man. That it was perfectly natural was sufficiently proved by the fact that he spoke exactly as he wrote, though, if possible, with more uniform brilliancy and force. Those who had the good fortune to be admitted to his society are almost unanimous in their opinion that his powers of conversation, or rather of familiar speech, were in their experience unequalled; yet it is intelligible that Luttrell, a witty diner-out of a past generation, should have been unable to appreciate Carlyle's originality. If he sometimes engrossed a large share of attention, the freshness of his fancy and the flow of his humour were alike inexhaustible. His imagination was so plastic that he could scarcely describe the commonest object without notice of some characteristic feature or picturesque peculiarity. It is to be hoped that some of his friends have preserved reminiscences of his descriptive or epigrammatic language; but it would be impossible to reproduce his spontaneous abundance of illustration. He denounced one of his friends who, with a purpose as humorous as his own, challenged him by affecting a tone of moral indifference, as fit to be President of the Heaven and Hell Amalgamation Society. He assured a member of Parliament who, with a similar object, excused a vote on the pretence of deferring to the wish of his constituents, that at the day of judgment the excuse would not serve. "It will be you that will be damned, and not your constituents." He once interrupted a eulogy which he considered excessive on an eminent economist, for whom he had nevertheless a sincere regard, by declaring that he was "an inspired bagman who believed in a calico millennium"; but isolated fragments of talk accidentally retained in the memory are little better than fragmentary specimens of some great work of architecture. In conversation, as in literary composition, he sometimes caused an irritation which was scarcely justifiable by steadily declining controversy. His hearers or readers were welcome to learn what he had to tell them; but he neither answered objections nor engaged in discussion. Those who differed from him were at liberty to hold their own opinions, but not to extract from him reasons which were inseparably connected with his feelings and his character. It would have required some obtuseness of perception not to recognize in personal intercourse his intellectual and moral elevation. His friends would sometimes have gladly received an interpretation of the meaning of the oracle; but they were compelled to be content with the responses. They could always count on turn on his ready appreciation of their thoughts, and on his hearty laughter.

Carlyle's rank as a moral teacher and a humorist has sometimes interfered with the recognition of his laborious study of historical facts. His minute industry is most remarkably exhibited in the Memoirs of Cromwell and in the Life of Frederick the Great. The plan of the Life of Cromwell was borrowed from Mr. Spedding, though the Life of Bacon was published at a later period. The scheme is exhaustive, but it has a tendency to be tedious; and, as a rule, the historian ought not to submit the raw material of his studies to the reader. The Remains of Cromwell are, fortunately, limited in bulk, and they receive a meaning and a kind of unity from Carlyle's suggestive comments. Even the chaotic, but not frivolous, speeches of the Protector are strangely illuminated by occasional interpolations, such as "Hear, hear, your Highness." It is true that the biographer is not exempt from an idolatry which suggests and justifies a certain scepticism in accepting his conclusions; but no other historian has made the character of Cromwell so consistent and so intelligible. For his later hero Carlyle's sympathy was far less perfect, and the history of Frederick's early years is told in unnecessary detail, while the twenty years during which he survived the Seven Years' War are skurged over in a few pages; but the history of Prussia in the first volume is an admirable specimen of concise narrative; and scarcely any writer has described battles so intelligibly, though Carlyle was otherwise unacquainted with military affairs. He has scarcely communicated to his English readers his own qualified admiration for his hero; but it must be remembered that all patriotic German feel an enthusiasm for Frederick and even a certain gratitude to his unattractive father.

The merits of Carlyle's prose epic on the French Revolution are of a different and of a higher order. The only copy of the first volume of the book was destroyed by an accident, and Carlyle

always believed that the version which he was compelled to substitute was inferior to the original. But it is difficult to believe that the brilliant and pathetic narrative which we now possess has been surpassed. There are fuller accounts of the Revolution, but many students remember the principal events most vividly by reference to the history which made them more interesting than scenes in a romance. His half-serious excuse for the people which always found itself baffled on the verge of an expected Paradise is perhaps the best apology for the crimes and follies of the Revolution. His admiration for Mirabeau is more justifiable than his characteristic tenderness for Danton. The chief author of the massacres of September was perhaps to be preferred to his successful rival; but the narrow pedantry of Robespierre, which excited the contemptuous aversion of Carlyle, was a venial aggravation of the guilt of the most murderous of tyrants. The *History of the French Revolution* first made Carlyle popular, and perhaps taught him his true vocation; but before and after its publication he exercised a wide influence by his contributions to literary criticism. His Essay on Voltaire displayed a remarkable power of appreciating both the merits and defects of the most typical of Frenchmen. The review of Croker's edition of Boswell has finally exploded the shallow prejudices against Johnson and his biographer which culminated about the same time in Macaulay's shallow and paradoxical criticism. The study of German literature in England has been more effectually promoted by Carlyle's early writings than by any other single cause. His devotion to the person and genius of Goethe is difficult to reconcile with his later predilections, for he was in after life not an enthusiastic admirer of poetry, or of literary eminence; and Goethe's sublime indifference to national interests and to other disturbing elements might have been thought uncongenial to the temperament of his devoted admirer. The impression produced by the great German writer was as permanent as it was profound. Long after he had entered on other fields of intellectual activity, Carlyle retained his original reverence for his master. Some correspondence had passed between them; but Goethe received coldly the overtures of his young admirer, who would willingly have made a pilgrimage to Weimar. No modern English writer is now so well known in Germany, which Carlyle always seemed to regard as a second mother country. Foreigners are probably less sensitive than English readers to the peculiarities of style. On the other hand, they are more likely to overlook or misinterpret his incessant employment of humour. In common with some other authors, he received general recognition in America earlier than in England; and his only successful imitator is a popular American essayist. In other copies his manner, denuded of his humorous imagination, becomes tedious and distasteful. It would be idle in a limited space to attempt even imperfectly to analyse Carlyle's peculiar and original powers. He had happily time and opportunity to indulge his genius to the full. His simple habits enabled him to choose for himself in dignified seclusion the subjects of his indefatigable literary labours. Whatever is incomplete in his works corresponds to the instinctive or deliberate limitations which he imposed on himself. It may be repeated that Carlyle was not a philosopher, but a prophet.

CURATES IN THE EIGHTEENTH CENTURY.

II.

DR. JOHNSON on his tour in the Highlands was entertained by Mr. M'Aulay, the Minister of Calder, who seems to have availed himself of the opportunity of a visit from an English guest to speak slightly of the lower English clergy. It was an attack not to be let pass without such a retort as the moment suggested. The Doctor gave him a frowning look, and said, "This is a day of novelties. I have seen old trees in Scotland, and I have heard the English clergy spoken of with disrespect." The Scotchman's charges were founded on hearsay. The standing of curates out of the way of preferment, ill-paid and over-tasked, was not one to excite popular respect, nor yet self-respect in men who live by the rule of what is expected of them. Yet not only were there exemplary curates who have left a name behind them, but a very slight consideration shows that the class offered a most sturdy resistance to the free-thinking liberalism of the day, and helped to furnish an effectual barrier against attacks on the Church's defences which were carried on in one way or another throughout the century. The literature and records of the eighteenth century show one continued assault upon creeds and articles. From Tillotson's time attempts were constantly made to adapt the Liturgy to modern tastes and ideas and to the scruples of various forms of nonconformity. Sanguine hopes of success under the patronage of such men as Bishop Hoadly, and, later, Bishop Watson, continued to attend these efforts; but at the end of the century (1796) the *Monthly Review*, the organ of the aggressive party, confesses defeat. In a notice of a sermon entitled "The Liturgy of the Church of England recommended," by the Rev. A. Macaulay, Curate of Claybrooke, we read—"The design of farther reforming the Church of England and improving its ritual, which has at different times attracted the attention and caused the exertion of many learned and able men among, not only the clergy, but the laity, and concerning which in the earlier period of our labours we had frequent occasion to express our sentiments, appears now to be altogether abandoned." The great body of the clergy, especially it may be the clergy of

read dispassionately from the illustrations of the day, effected the necessary assistance. That strikes for their part in it we may learn from the record left of one sturdy example of the class, whose ministry extended through the first half of the century. The Rev. John Bold, who was ordained to the curacy of Stony Stanton in Leicestershire in 1702, and held it till his death in 1751, was probably of a temper opposed by nature as well as principle to change. The stout Church principles on which he began his ministry were only strengthened by time. The man who, well born, a scholar and of literary power, could settle down deliberately for life on a salary of 30*l.* a year, his whole dependence (it was never raised), and could live contented and honoured upon it for fifty years, was not one to follow a tide of newfangled ideas. The record of his life, as gathered from the recollections of the parishioners by a rector of Stony Stanton, is a short one, but impresses one by the earnestness of the writer and his veneration for his subject:—

To say that Mr. Bold was an able and orthodox divine, a good writer, an excellent preacher, an attentive parish priest, in the smallest part of his praise. He appears from the early age of twenty-four years to have formed his plan of making himself a living sacrifice for the benefit of his flock; and to have declined preferment (which was afterwards offered to him) with a view of making his example and doctrine the more striking and effective by his permanent residence and labours in one and the same place. His ministerial labours were such as I apprehend his own sense of the pastoral office, of its high importance to the salvation of mankind, directed. . . . He read the Fathers and the early writers of the Reformation—what they prescribed he fulfilled. During the whole of Lent, on holidays, and on every Wednesday and Friday, he had service in the church, and he had engaged the people to attend so generally and regularly that it is related of one farmer particularly, that whenever he was absent from his business he was to be found at church.

The account goes on to give details of his life and personal habits, which of course explain his extraordinary influence upon his flock. Living and associating with them, his character never lost its weight and authority; and this under considerable difficulties, for the humblest particulars of his private life were open to his parishioners. He lodged with a farmer; at first paying 8*l.* a year for his board, then 12*l.*, at last 16*l.* His daily food consisted of water-gruel at breakfast; a plate from the farmer's table at dinner; after dinner, his only luxury, half a pint of ale of his own brewing; his supper, milk pottage. In summer he read and wrote in his own room; in winter by the family fireside. His dress, an ample decent gown which folded over and was bound round the waist by a sash, no doubt added to the reverence of his presence. But no more rule or garb can win influence. Manner and speech, and the heart that moulds and dictates them, can alone do this. Mr. Bold's influence was proved in a very practical fashion. "Except," we read, "in the case of a discharged soldier, who was guilty of robbing, I cannot learn that any felonious act was committed in the parish for half a century." And one particular instance is given of the effect of his teaching and example, and its hold on the memory, where the writer describes the religious and exemplary course of an old labourer of eighty-nine, whom he visited in his decline:—"Ah, Sir, that was a rare team I drove when I was young; but, Sir, whenever the church bell rang at 3 o'clock on Saturday afternoon I always left my team, when at plough, and came to Mr. Bold to be catechized, and then went back to plough." Goldsmith, we see, need not have been thrown on imagination for his picture of the ideal village pastor.

Such a pastor would certainly not approve of interference in his proper field. Nor did Mr. Bold. In the distribution of his income—we really hope that the management of it, the lavish charities, the making it do more than thirty pounds ever did before, was a personal pleasure to him—he laid by a sufficient sum to endow a sermon to be preached yearly in Lent on the duty of the people to attend to the instructions of the minister whom the bishop of the diocese should set over them. "This bequest, it is explained, seems to have been occasioned by the rise and progress of the fanatic teachers of Methodism." Yet, no doubt, Methodism in its rise was one material barrier to the encroachments of liberalism. The tone of attack on it explains the real grounds of objection to the language of the Prayer-Book. Whoever accepted this language incurred the same measure of satire and abuse. Thus, in a criticism on a sermon on the Eucharist by Samuel Hardy, Curate of St. Clement's, Ipswich, we read:—

If the famous proposition of the late pious Dr. James Foster be true, that *where mystery begins, religion ends*, then is Mr. Samuel Hardy a very irreligious writer, for he is a most zealous stickler for these mystical notions of the Sacrament, which have been so justly exploded by several eminent and judicious modern writers. The worthy Bishop Hoare's *Plain Account* he styles an *infamous* book, and gives his own tract as a full and complete answer to it.

The Jesuits are suspected by these critics to be at the bottom of the language and teaching of the Methodists. St. Francis Xavier's life was indeed brought forward by a Methodist writer as an example of the missionary spirit, and the reviewer sees no difference between the two manifestations of enthusiasm. Fanatics of all religions are the same. The expelling of the "six enthusiastic students" from St. Edmund's Hall, Oxford, meets with derisive exultant approbation. The same determination to stamp out enthusiasm with the strong hand is applied to orthodoxy—identified with High Church worship—and Methodism.

No stronger contrast can be found than that between the two curates of the eighteenth century, each remarkable in his way, who stand as specimens of their class—namely, John Bold and the more celebrated John Newton, whose name, though a curate only sixteen years (from 1764 to 1780), lives as Curate of Olney, where, in conjunction
